Heavy quark meson spectroscopy at CDF

Kai Yi

University of Iowa

(for CDF Collaboration)

DPF 2009, Detroit, July 28, 2009

Challenges from charmonium-like states

Quark model works pretty well so far

however, it is challenged by newly discovered charmonium-like states

these states are called X/Y/Z

Outline

CDF has been involved the first X states—X(3872) and continues to contribute to it: determine quantum number, precisely measures X(3872) mass.

CDF new contribution to X/Y/Z: Y(4140) ➔J/ΨΦ

Strong Points for CDF

Heavy hadrons at Tevatron are:

- *copiously produced*

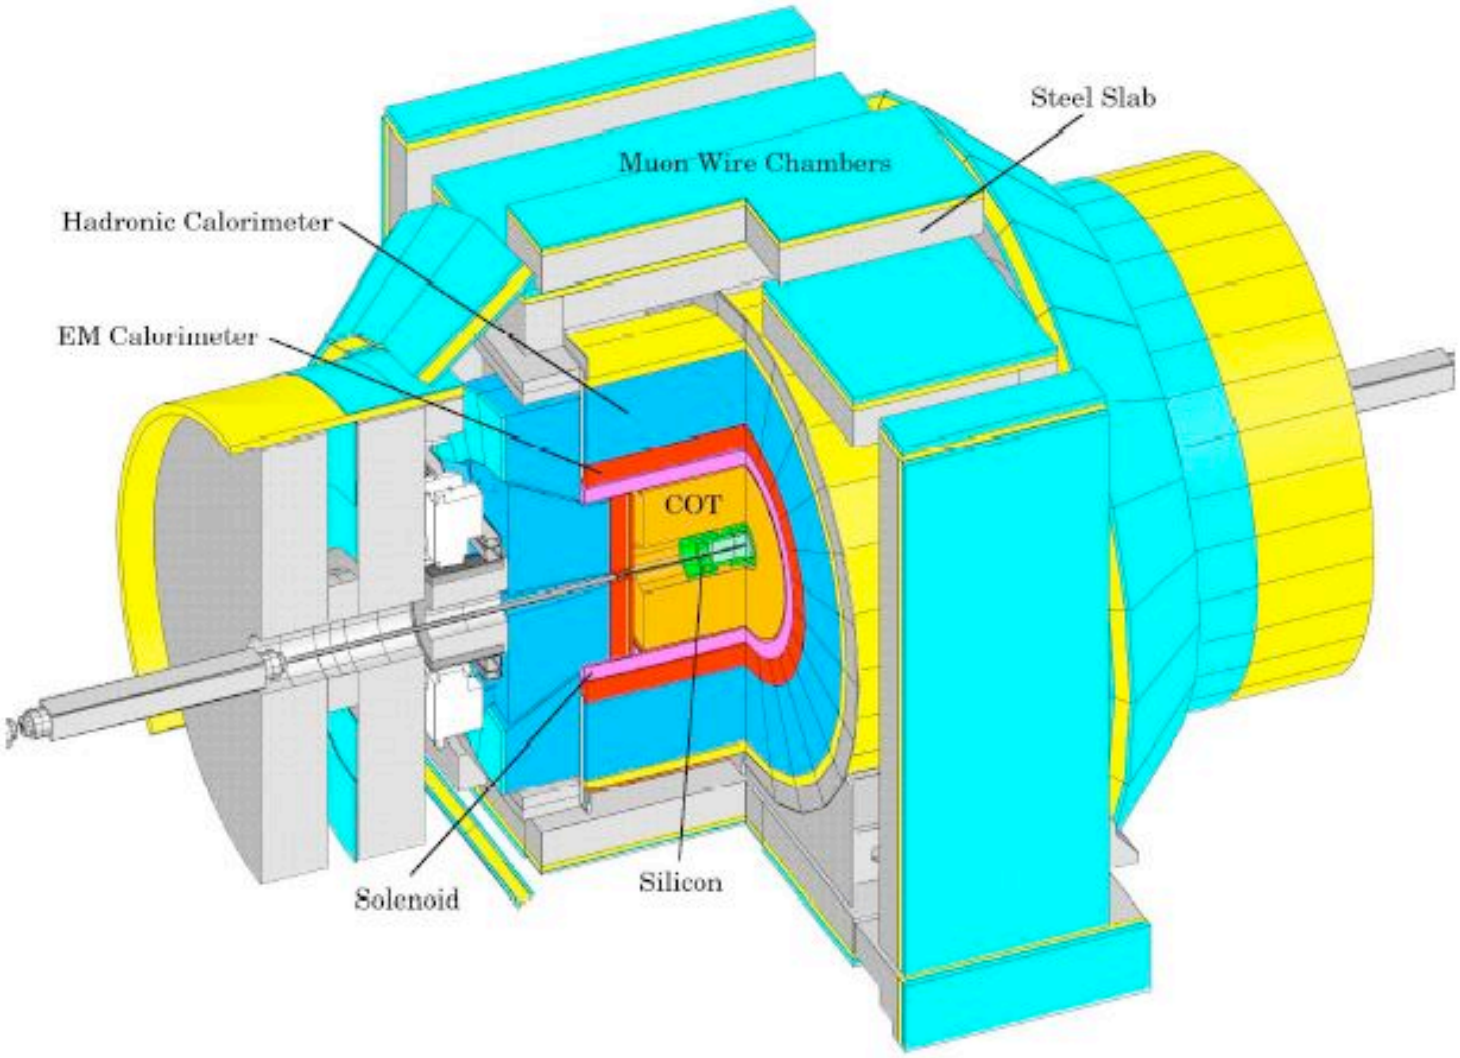
- *boosted*
  --vertex separation
  --boost low p_T daughters

CDF has:

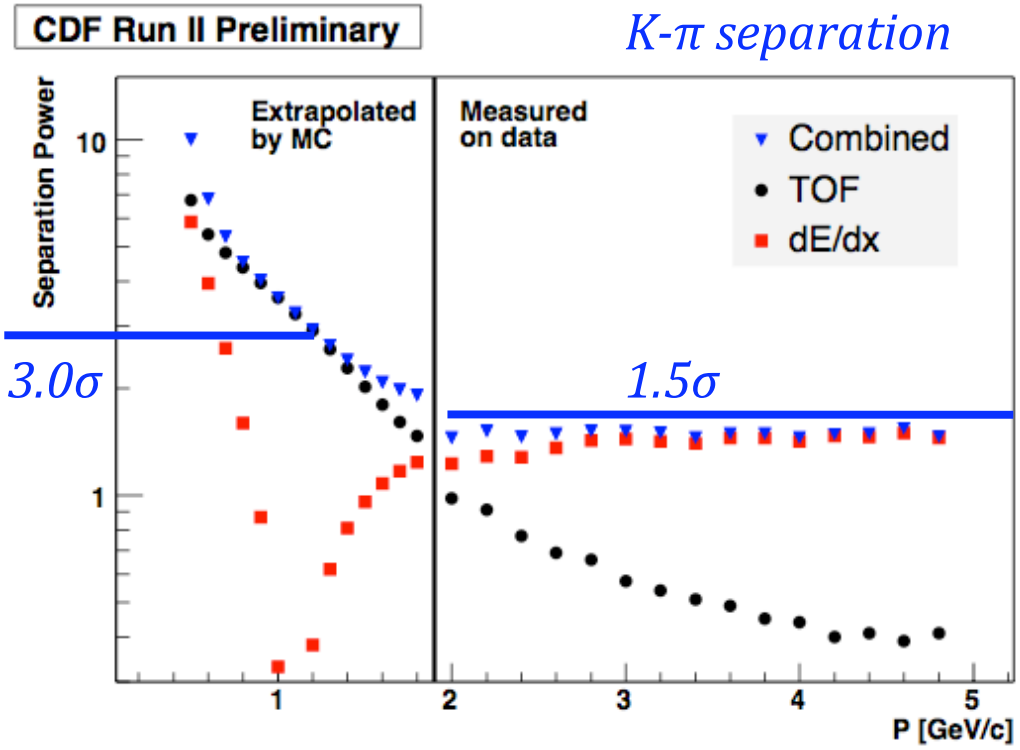
- *excellent mass resolution*
- *excellent vertex resolution*
- *reasonable hadron PID*

CDF detector

- ***Muon***: *μ ID*
- ***ToF***: *TOF*
- ***COT***: *track p dEdx*
- ***Silicon***: *track p vertex*

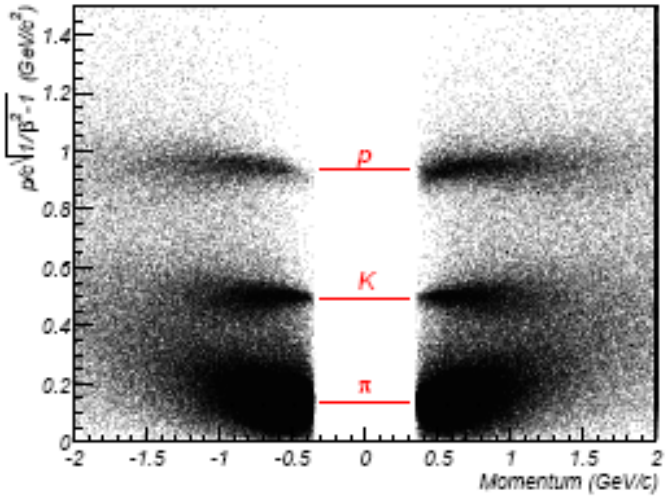


CDF hadron PID

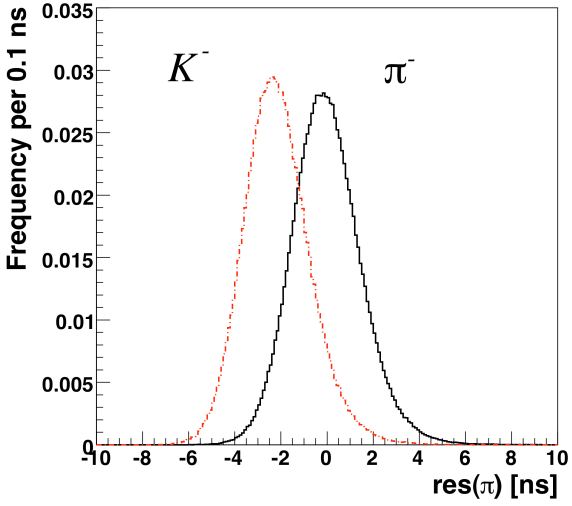


K-π separation

CDF Time-of-flight—TOF mass



dEdx residual



summarizing dEdx and ToF into a log-likelihood ratio

Typical B decay daughter momentum ~GeV,
Main background: prompt pions

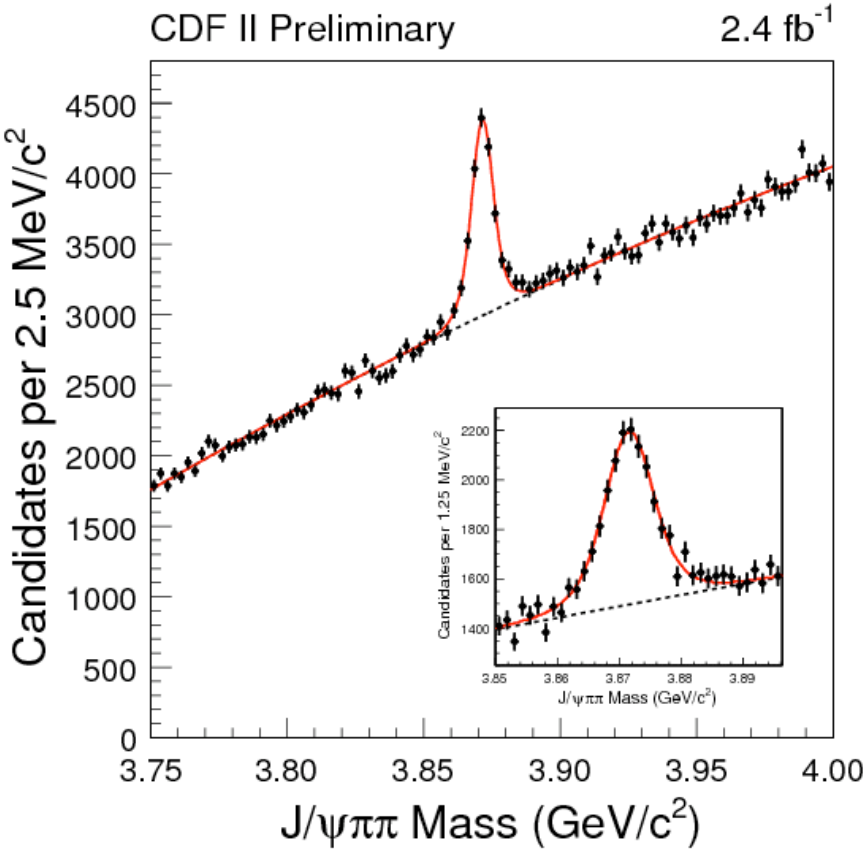
New X(3872) Mass Measurement at CDF



~*6000* *signals*

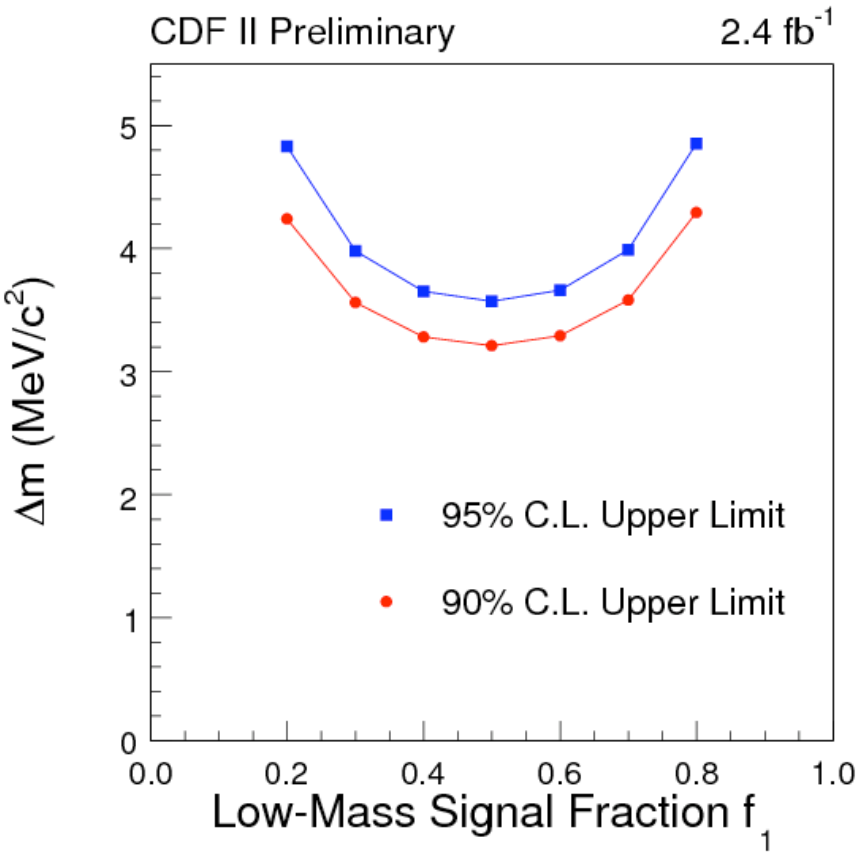
The largest sample to date

Use neural network to select

I. Test the hypothesis of:
X(3872) composed of two states?

II. Make (most) precise mass measurement
Relevant to DD molecule hypothesis*

New X(3872) Mass Measurement at CDF



Assuming different fraction for possible two states.

Breit-Wigners convoluted with resolution (assuming same width-1.34 MeV/c^2)

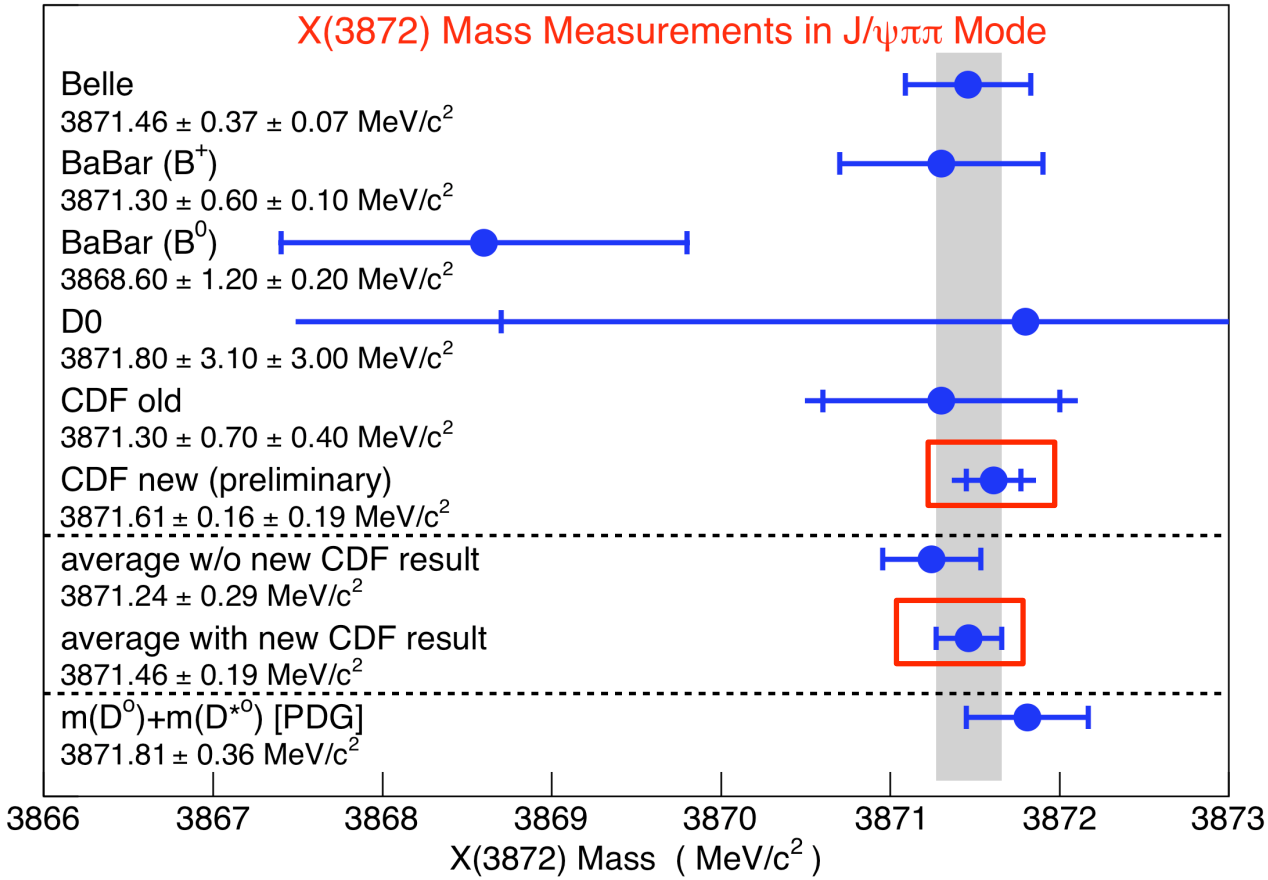
Consistent with one state in data, set limit for two state mass difference:

$\Delta m < 3.2\ (3.6)$ MeV/c^2 at 90% (95%) C.L.

Conclusion:
Consistent with one state hypothesis.

m(X(3872)) = 3871.61 ± 0.16 (stat) ± 0.19 (syst) MeV/c^2
(assuming one state hypothesis)

New X(3872) Mass Measurement at CDF

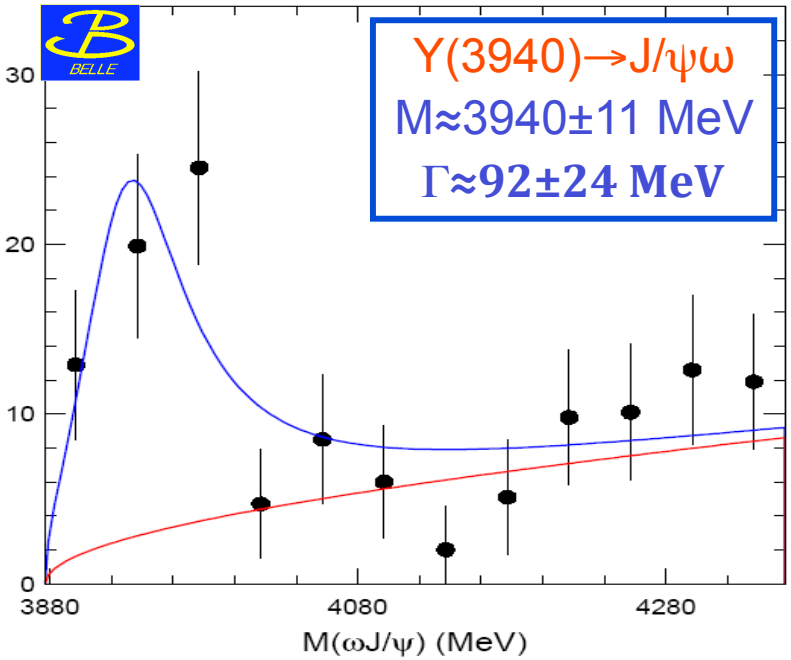


Consistent with one state hypothesis

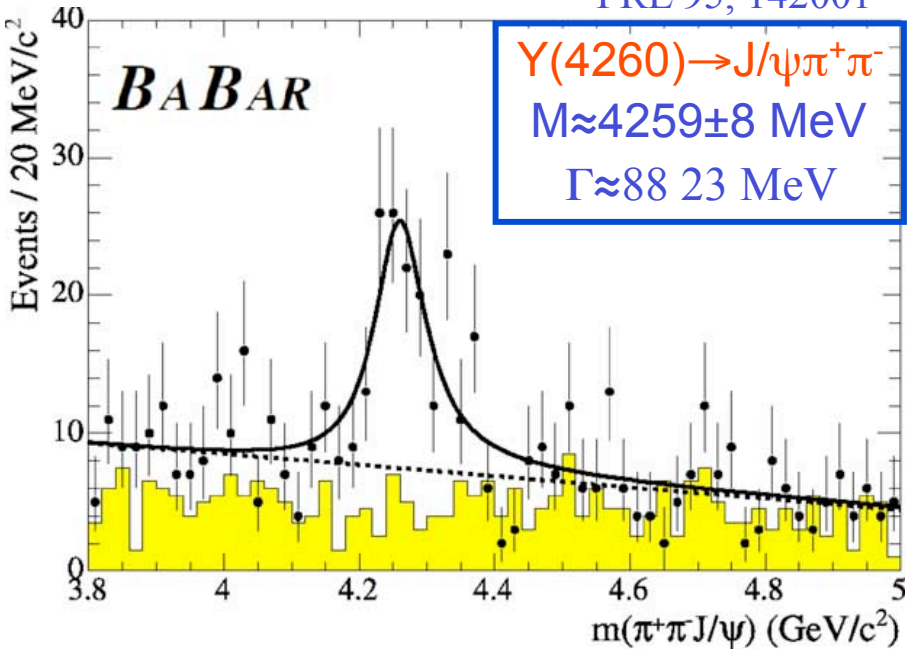
*The most precise measurement to date, still within the D*D threshold uncertainty*

Motivation to search for new state

PRL 94, 182002



PRL 95, 142001



Above DD̄ && DD̄ threshold,*
tiny Branching Fraction expected
New mass and width from BaBar:
$M \approx 3914^{+3.8}_{-3.4} \pm 2.0, \Gamma \approx 34^{+12}_{-8} \pm 5$ MeV
at the J/ψω threshold ?

Well above DD̄ && DD̄ threshold,*
tiny Branching Fraction expected
$J^{PC}=1^{--}$, plus Y(4350), Y(4660)
too many 1^{--} ?

Many more, for instance, Z(4430)+, but no heavier quark such as s involved.

Why search J/ΨΦ?

- *Possibilities of four-quark states, hybrid etc have been proposed*

J/ ψϕ

- *extends to heavy quark*
- *reaches for four-quark states*
- *reaches for hybrid*
- *reaches for other possibilities such as nuclear-bound states etc*

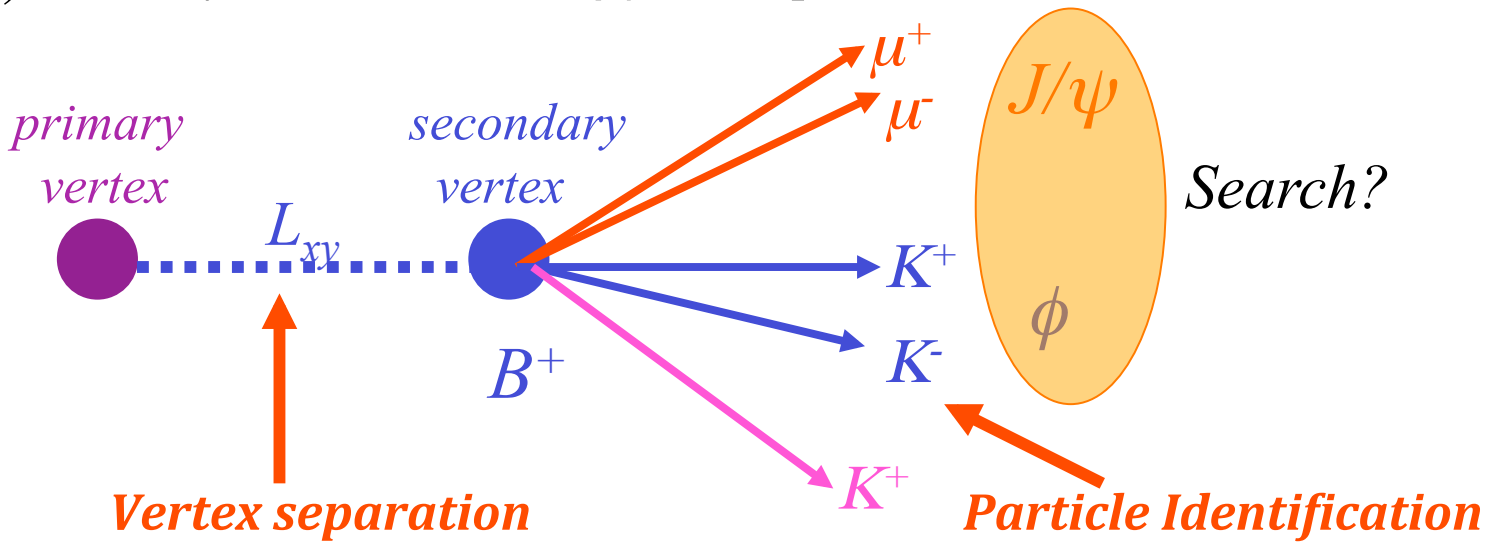
Search through exclusive B decays is experimentally easy
B➔J/ΨΦK decays have been observed
No structure has been reported so far

Analysis strategy

- *I) Reconstruct B^+ as:*

$$B^+ \rightarrow J/\psi\phi\, K^+$$
$$J/\psi \rightarrow \mu^+\mu^-$$
$$\phi \rightarrow K^+K^-$$

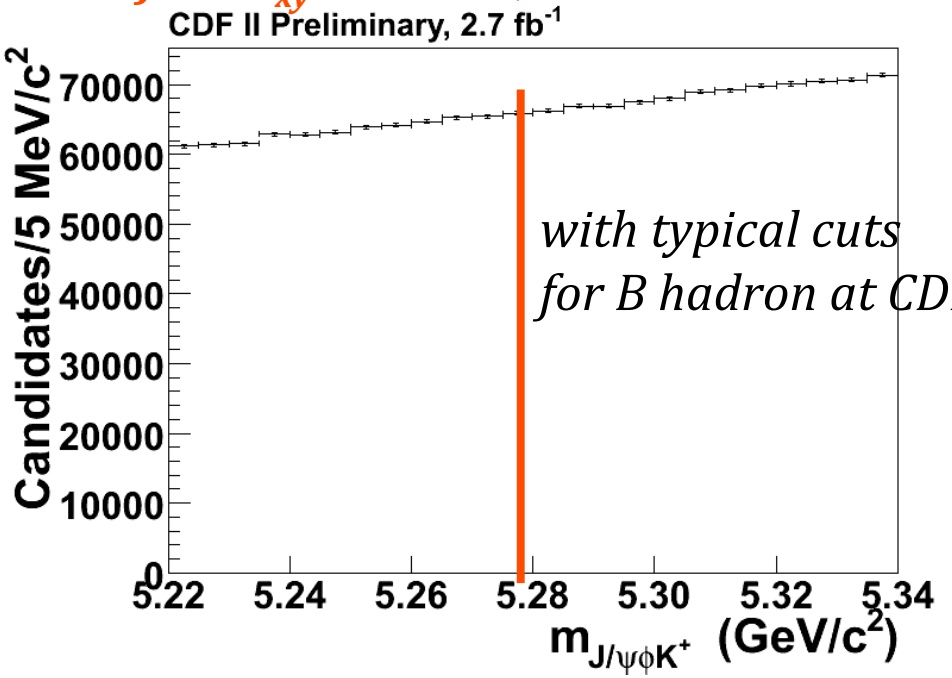
- *II) Search for structure in $J/\psi\phi$ mass spectrum inside B^+ mass window*



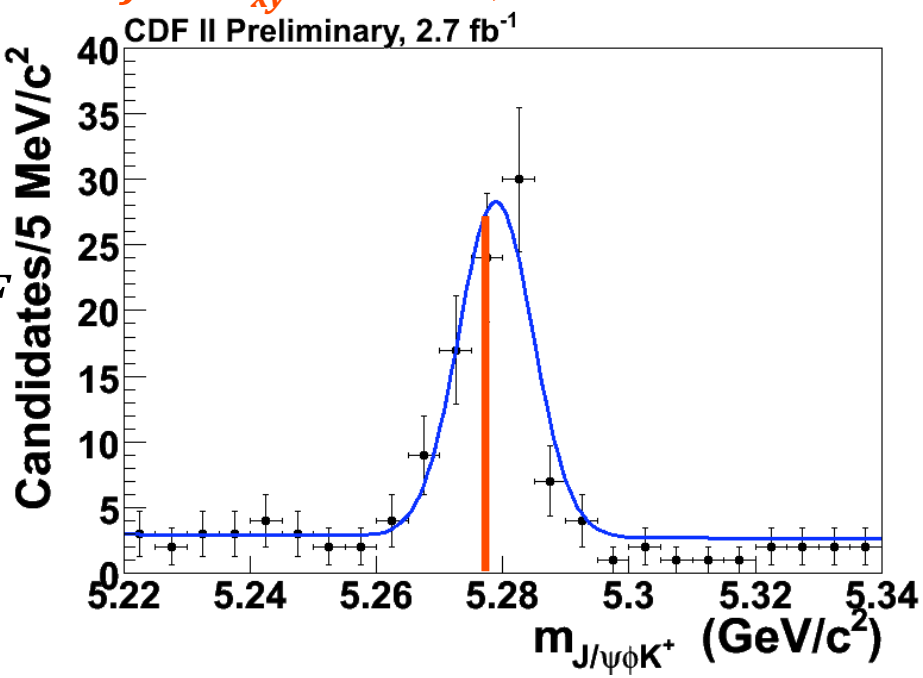
I) Reconstruct $B^+ \rightarrow J/\psi\phi K^+$

The key to reconstruct B signal

Before L_{xy}>500 um, kaon PID>0.2



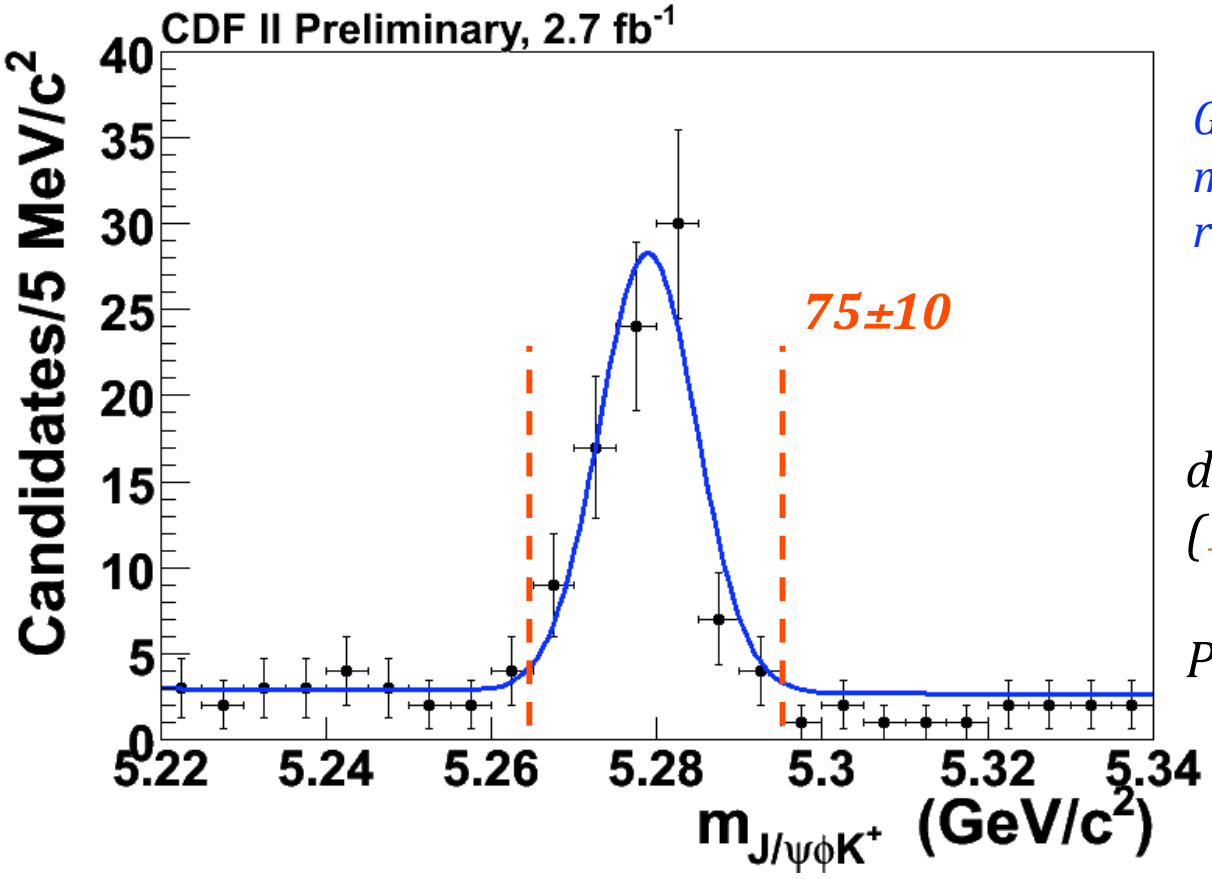
After L_{xy}>500 um, kaon PID>0.2



Hard to see B signal without L_{xy} and kaon PID

Reduce background by a factor of ***20 000*** *by using L_{xy} and kaon PID cuts while keeping about* ***20%*** *of signal as estimated by control channels.*

Applying L_{xy} and kaon PID



Gaussian function
mean fixed to PDG
rms fixed to resolution (5.9 MeV)

define ±3σ as B^+ signal region
(17.7 MeV obtained from MC)

Purity ~80% in B^+ region

Is φ pure?

Kaon PID reduce background by a factor of ~100
clear $B^+ \rightarrow J/\psi\phi K^+$ signal

Verify $B^+ \to J/\psi\phi K^+$

- *Investigate components of B^+ peak*

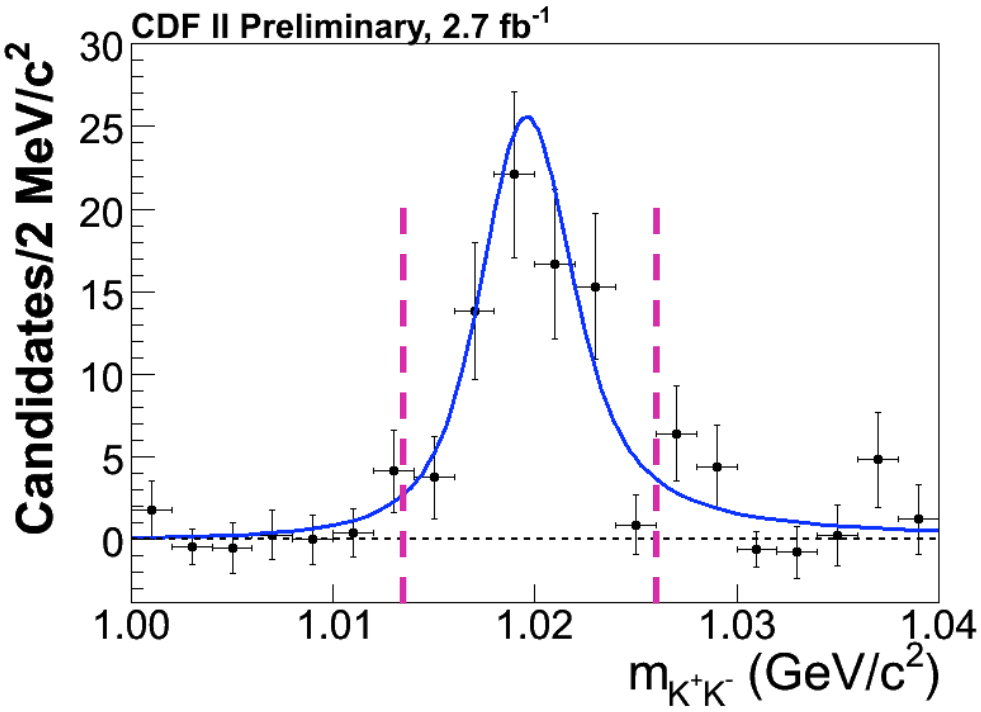
  --relax K+K- mass window to:

  [1.0,1.04] MeV

  --do B^+ sideband subtraction for K^+K^-

  --fit to sideband subtracted K^+K^- mass

- *A P-wave relativistic BW only fit to data with χ^2 probability 28%, no $f_0 \to K^+K^-$ or K^+K^- phase space components with our ϕ mass window*



Conclusion

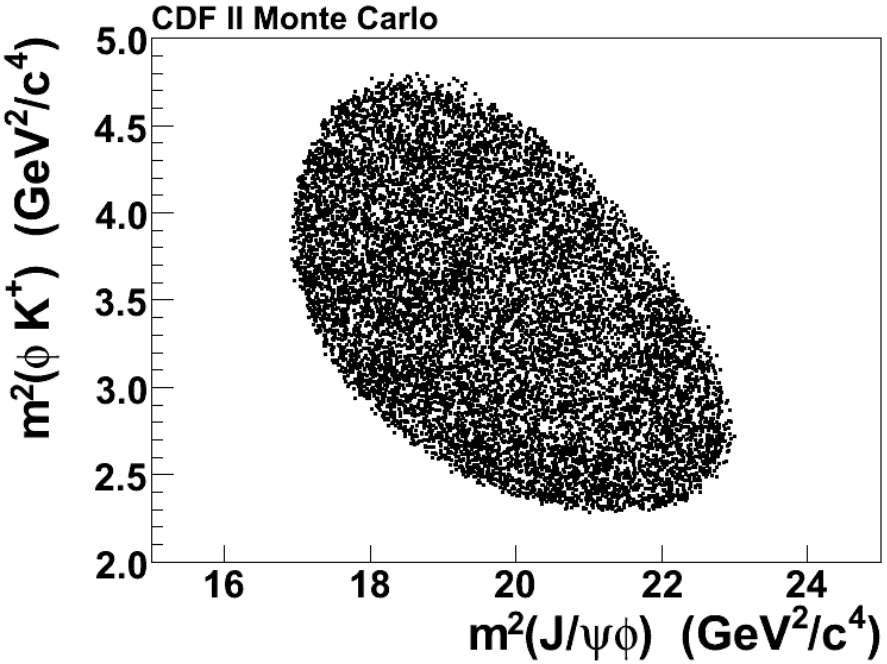
pure ***$B^+ \to J/\psi\phi K^+$ for B^+ peak***

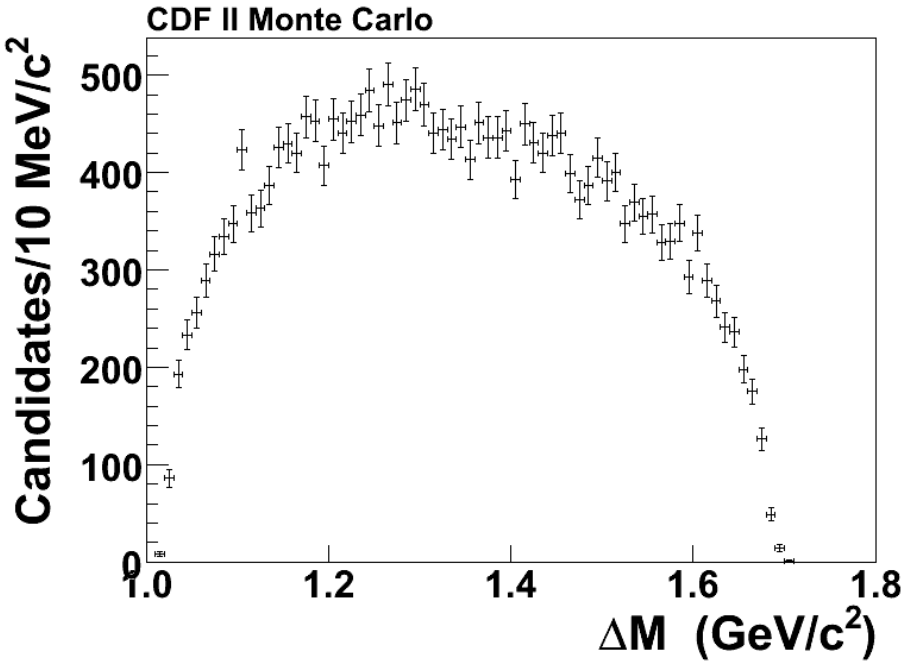
negligible ***$B^+ \to J/\psi f_0 K^+$, $J/\psi K^+K^-K^+$*** *components*

II) Search for structures in $J/\psi\phi$ spectrum from B

Investigate $J/\psi\phi$ mass spectrum in MC

- *MC simulated phase space, full detector simulation*





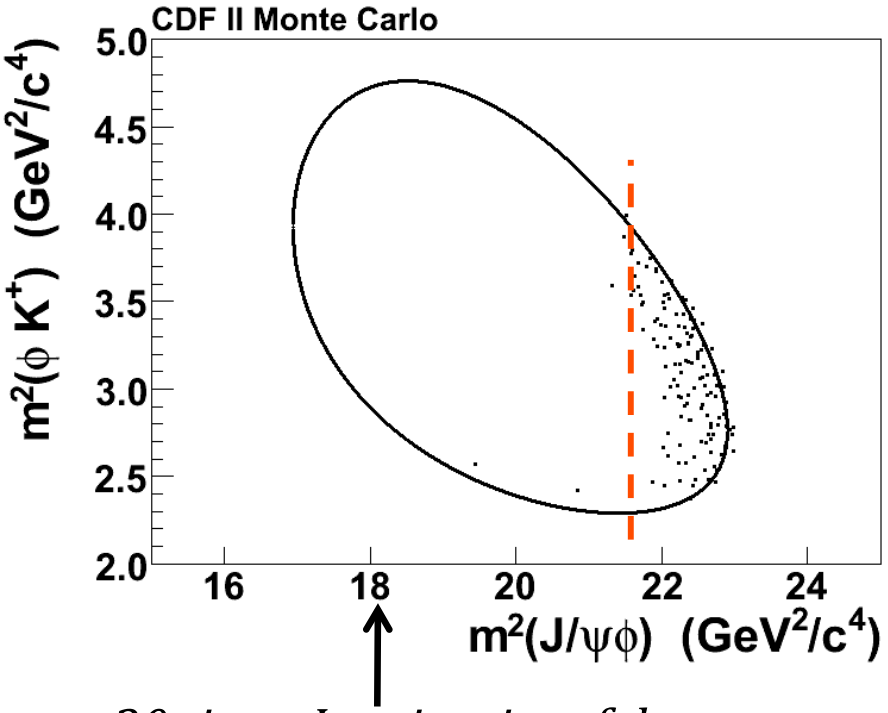
$\Delta M = m(\mu^+\mu^- K^+ K^-) - m(\mu^+\mu^-)$

- *MC events smoothly distributed in Dalitz plot*
- *No artifacts in the $J/\psi\phi$ mass spectrum*

Investigate $J/\psi\phi$ mass spectrum in MC

- *We simulate generic B hadron decays with a J/ψ in the final state and we identified a contamination channel:* $B_s \to \psi(2S)\phi,\ \psi(2S) \to J/\psi\pi^+\pi^-$

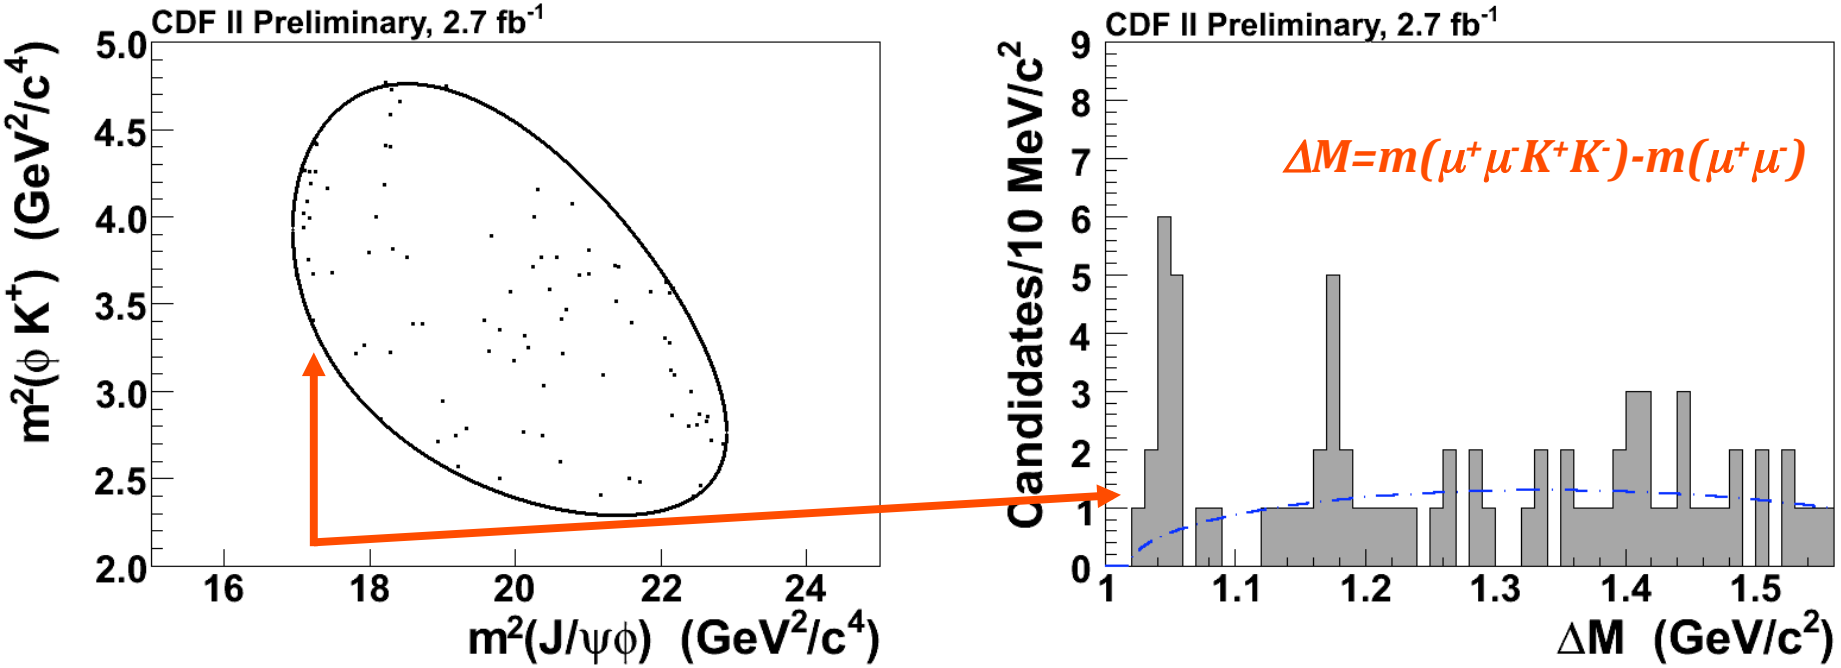
$(B_s \to \psi(2S)\phi,\ \psi(2S) \to J/\psi\pi^+\pi^-) \to B^+ \to J/\psi\phi K^+$ **due to kaon mis-identification**



20 times Luminosity of data

- *Bs contamination at ΔM>1.56 GeV, cut it off for simplification*

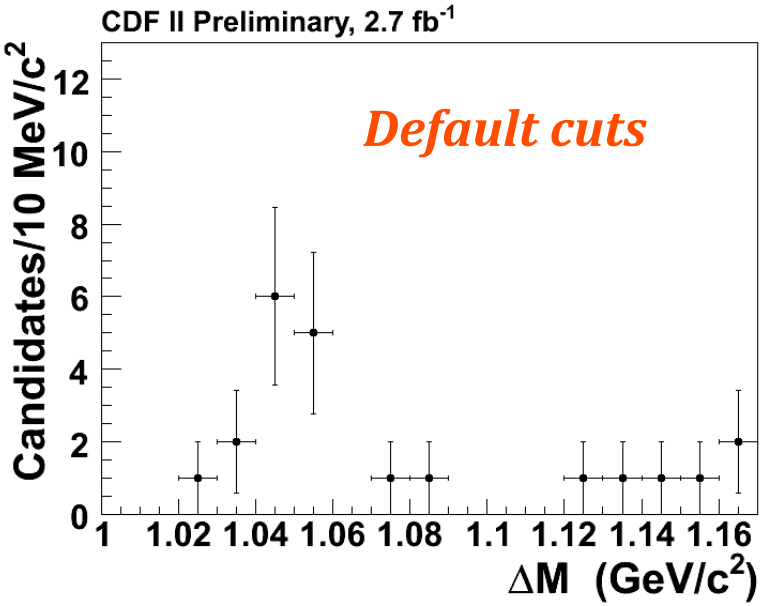
Search for structures in $J/\psi\phi$ mass--Data

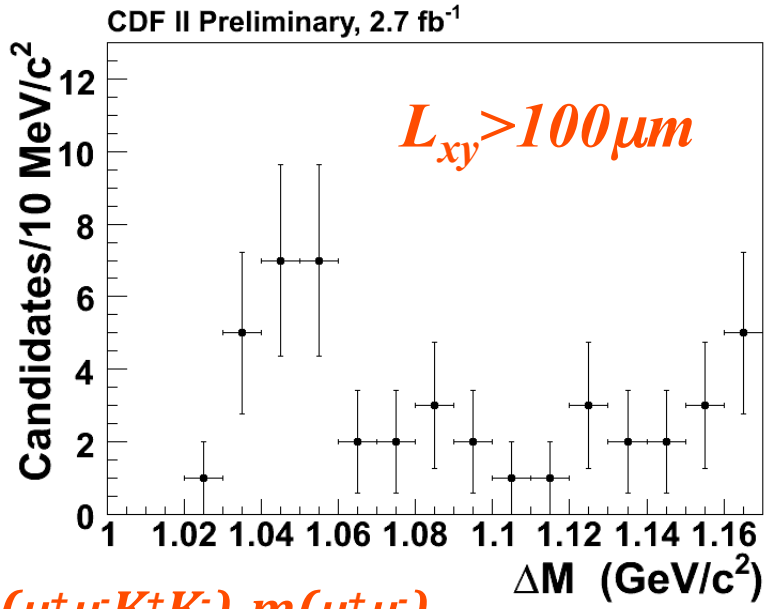


Three-body Phase Space Background shape is different from data

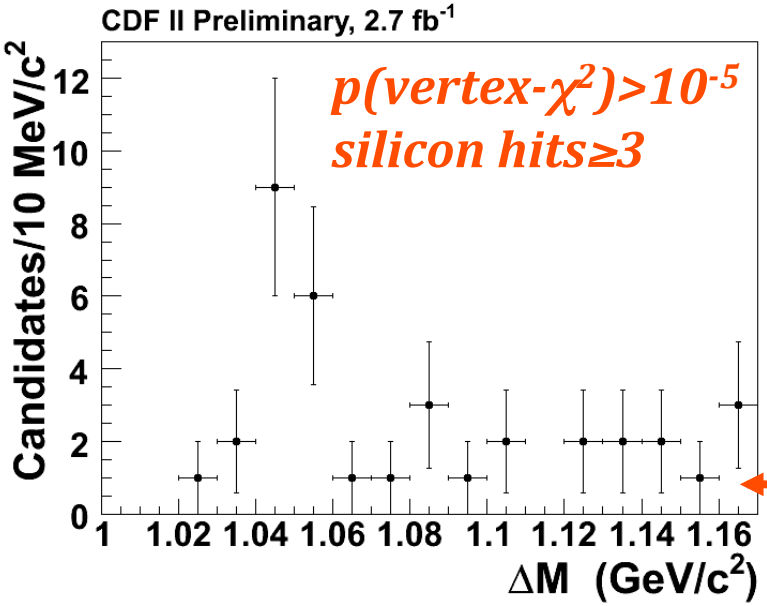
An near threshold enhancement is observed

Robustness test





$\Delta M = m(\mu^+\mu^- K^+ K^-) - m(\mu^+\mu^-)$

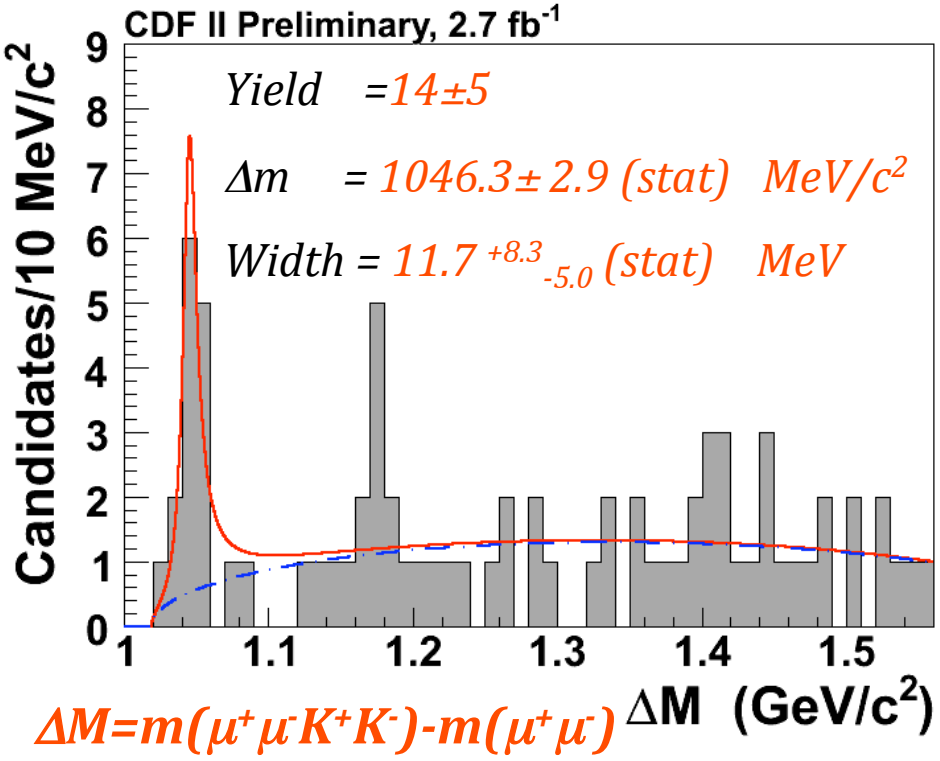


- *Extensive cross checks by varying L_{xy}, kaon PID, B^+ mass window, vertex probability, # of silicon hits,…*
- ***Robust against variations***
- *More signal but with more background*

Search for structures in $J/\psi\phi$ mass--Data

- *We model the Signal (S) and Background (B) as:*

S: S-wave relativistic Breit-Wigner *B: Three-body decay Phase Space*



Convoluted with resolution (1.7 MeV)

Mass=:
4143.0 ± 2.9 (stat)± 1.2 (syst) MeV/c^2
(adding J/ψ mass)

$\sqrt{(-2\log(L_{max}/L_0))}$=5.3, *need Toy MC to determine significance for low statistics*

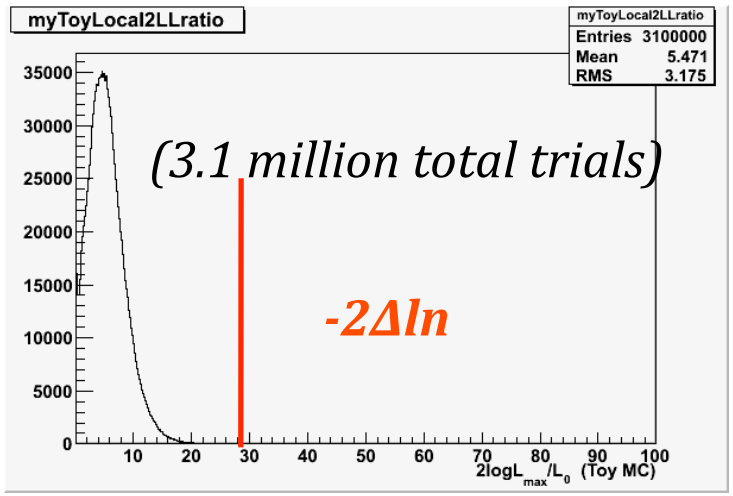
Significance study

- *We determine significance from simulation (Toy MC):*

  --Generate Δm spectrum using Phase Space

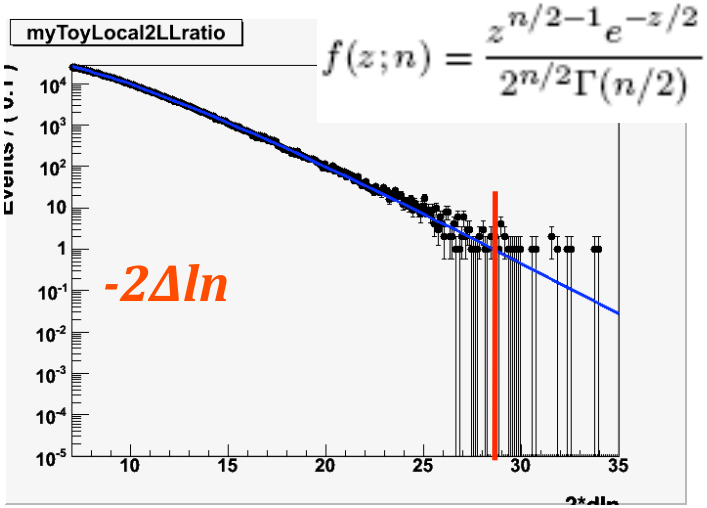
  --Find most significant fluctuation for each trial anywhere with floating width

  --Count it if $-2\log(L_{max}/L_0)$ *(**-2Δln**) ≥ -2Δln value in data*



χ^2 *PDF*

$$f(z;n) = \frac{z^{n/2-1}e^{-z/2}}{2^{n/2}\Gamma(n/2)}\ ; \qquad z \geq 0$$

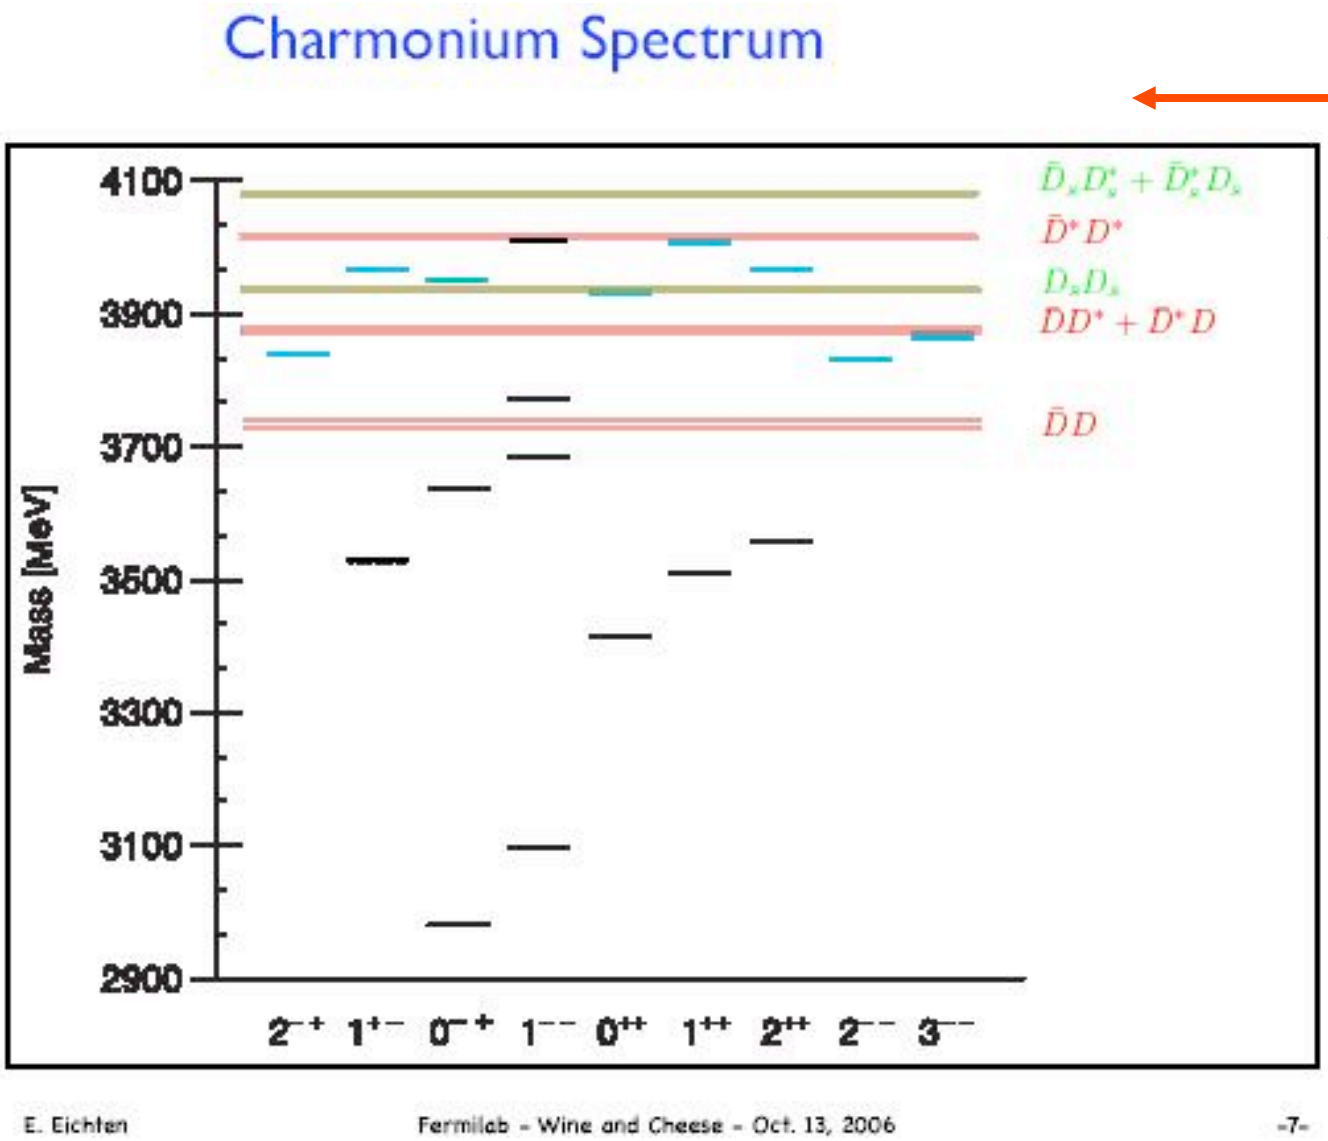


P-value: 9.3X10^{-6}, corresponding to 4.3σ

P-value from χ^2 ***PDF**: 6.5X10^{-6}, 4.3σ*

Most conservative: Phase Space and flat for non-B background, 3.8σ

What is it?



Y(4140)

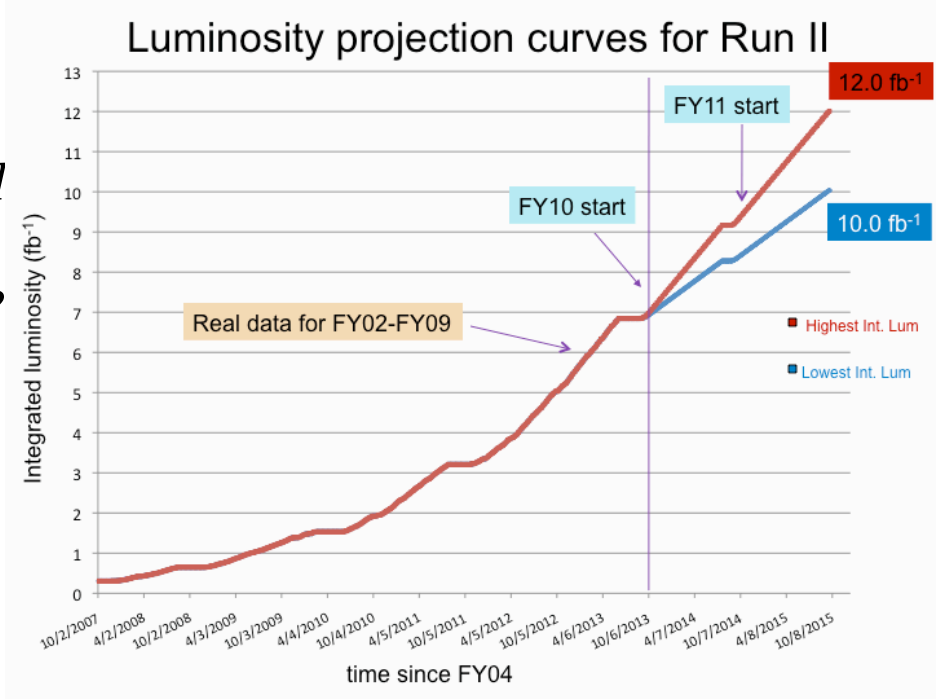
- *Well **above** charm pair threshold*
- *Expect **tiny** BF to $J/\psi\phi$*
- *Does **not** fit into charmonium*
- *Close $J/\psi\phi$ threshold like Y(3940)*

arXiv:0903.2529[hep-ph]
molecular?

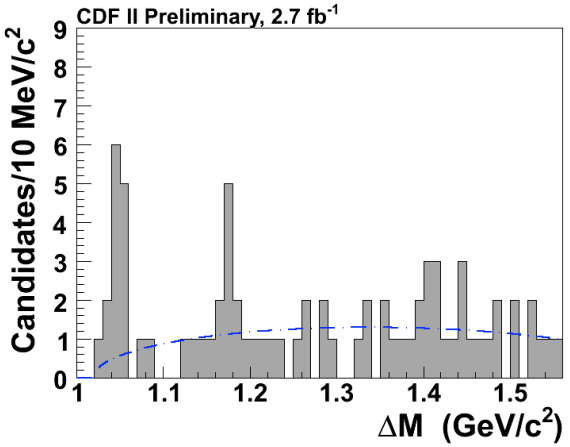
Opportunities

- ***Determine J^{PC} (C=+)? Need statistics***
  --increase efficiency, reduce background
  --add more data, ➔ 5σ
  --investigate efficiencies against angles?
  …

- ***More channels for this structure?***
  --open charm pair?



Note: *Search for potential more structures?*
$B^+ \to \phi\phi K^+$, $B_s \to J/\psi\phi\phi$,…
$\Upsilon(nS)\phi$, …



Summary

I. CDF observes a new structure in $J/\psi\phi$ spectrum through B decays, at least 3.8σ

Mass = $4143.0 \pm 2.9\ (stat) \pm 1.2\ (syst)$ MeV/c^2

Width = $11.7\ ^{+8.3}_{-5.0}\ (stat) \pm 3.7 (syst)$ MeV

$J^{PC} = ?^{?+}$ **tentatively name it as Y(4140)**

$B^+ \rightarrow Y(4140)K^+$, $Y(4140) \rightarrow J/\psi\phi$) BF estimation: $\sim(9 \pm 3.4(stat) \pm 2.9(BF)) X10^{-6}$

II. CDF continues to contribute to X(3872):

$m(X(3872)) = 3871.61 +- 0.16\ (stat) +- 0.19\ (syst)\ MeV/c^2$

Most precise to date!

Stay tuned!

The challenge

- *Start with typical requirements for B hadron at CDF:*

  --p(χ2) for B^+ vertex fit>1%

  --p_T(track)>0.4 GeV,

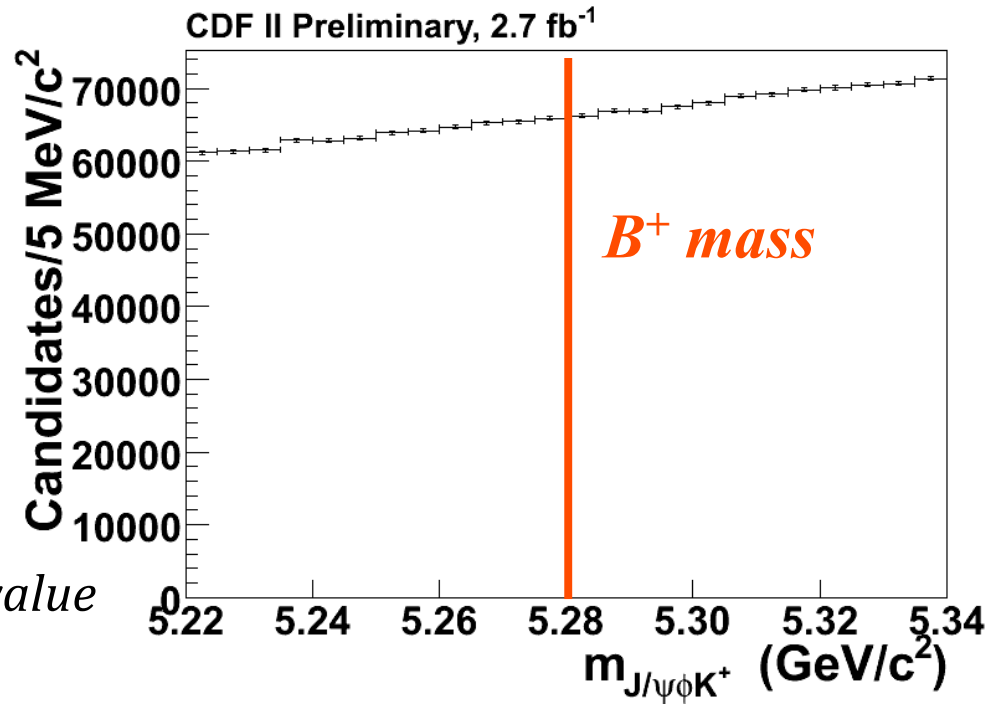
  -- >=4 r-φ silicon hits

  --$p_T(B^+)$>4 GeV

  --mass window:

  J/ψ (±50 MeV) and φ (± 7 MeV)

  constrain $\mu^+\mu^-$ to J/ψ PDG mass value

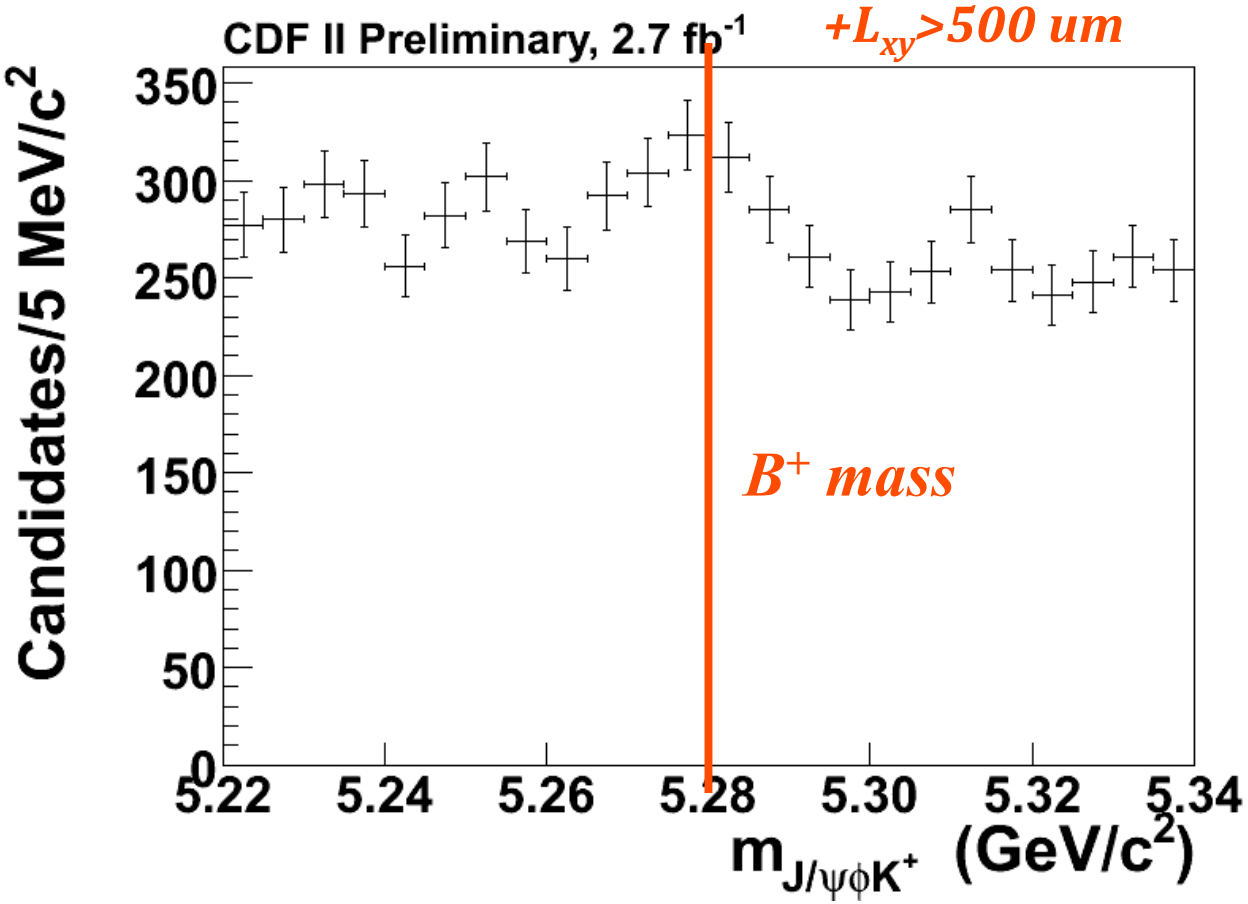


- ***NOT*** *applied yet:* ***L_{xy}*** *and kaon* ***PID***

Typical hadron collider environment

Applying L_{xy}

- *Maximize* $S/\sqrt{(S+B)}$ *for* $B^+ \rightarrow J/\psi\phi K^+$ *signal, has nothing to do with* $J/\psi\phi$
- *Maximized cuts:* L_{xy}*>500* μ*m, kaon LLR>0.2*



L_{xy} *Reduce background by a factor of ~200*

Control channels

- *We also reconstruct two control channels with similar cuts:*

  ~3 000 $B_s \rightarrow J/\psi\phi$, ***~50 000*** $B^+ \rightarrow J/\psi K^+$

  before L_{xy} *and kaon LLR cuts*

- *Clean control signals after* L_{xy} *and kaon LLR cuts*
  cross check and efficiency evaluation
