WP2 security status

- **RPMS for secure tomcat, authentication and authz out**
- **LCFG for secure tomcat out**
- **Prototype or delegation ready, but further development postponed until authz integrated.**
- **Currently integrating authz to WP2 software**
- **Medium grained authorization (or enforcement)**

Technology program

<http://wikihip.cern.ch/>

Delegation

- **Uses G-HTTPS-ish protocol**
- **Command line client and client api**
- **Only java, plans for c/c++**
- **Delegations currently only in memory in tomcat**
- **Delegations per service**
- **Service api to get the delegation from the delegation storage in the server**
- **Client can delegate and get info about delegations in server**
- **Delegation ID allows several delegations in single service**

Medium grained authz

- **Could also be called enforcement**
- **Stopgap for WP2 until time for finegrained**
- **Simple method based access control**
- **Authzmanager provides service specific roles (LRC)**
- **Medium grained authz filters using roles and service specific method access lists**
- **Ex: LRCAdmin=delete, replicate, list**
- **Ex: LRCUser=list, replicate**

gSOAP

- **Edg-gsoap-base, basic gSOAP package with:**
 - User proxy certificate
 - Server proxy certificate
 - Authorization policy and role support (when not using VOMS)
 - Additional useful packaging to ease development
- **Needed in the WSDD creation, header files during compilation and library while running**

Technology program

```
#include "WP2Security.h"
#include <iostream.h>
#include "SpitfireInfoService.h"
#include "stdsoap2.h"
/*
```

Example to contact the information service and get a list of tables
as well as their 'create table' commands

```
*/
```

```
int main(int argc, char * const argv[])
{
    char *credentials = NULL;
    char *cacertdir = NULL;
    char *passphrase = NULL;
    char *rseedfile = NULL;
    char *accessurl = "https://localhost:8443/Spitfire/services/SpitfireInfo";
    char *role = "default-readrole"; char *policy = "test";
    struct soap *s = soap_new();

    if (edg_data_soap_sec_ctxt_init_m(s,passphrase,credentials,cacertdir,rseedfile)){
        cout << "wp2 soap security init failed " << endl;
        exit(1);
    }
    edg_data_soap_sec_add_role_and_policy_m(s,role,policy,role,policy);
    //edg_data_soap_sec_print_sec_parameters(s, stdout);
    SpitfireInfoService query(accessurl,s);
```
