Workplan summary

From the Barcelona ATF,
revised with (and approved by) WP2

But quoting from memory…

Highest

- Migration tools

High

- Asynchronous requests
- SRM version 1 interface
- Additional SRM (from 2.1) – exists, delete
    - Unfortunately these depend on disk cache management if done properly
- Collaboration with WPs 9 & 10
- Support for 2.0
- Documentation

Medium

- Disk cache management
  - Required for pinning
  - Pinning, in turn, is required for full SRM support
  - Required for doing delete and exists properly
- VOMS
  - Hopefully not much work for WP5 to support VOMS
- Documentation

Low

- SRM Copy
  - Needed to fully support SRM v1.1 and 2.1

Not (yet) on roadmap

- Providing a list of all files in SE belonging to a VO
  - DoS attack against SE?
  - Also violates access control on listing contents of directories?
  - Currently, client must do recursive `ls` instead

Not (yet) on roadmap

- tar
  - Needed for putting many “small” files into SE on traditional MSS
