- Background:

Final State	$\sigma$ (fb)
q-qbar (u,d,s,c,b)	$\sim 1600$
t-tbar	$\sim 300$
W <sup>+</sup> W <sup>-</sup>	$\sim 4300$
ZZ	$\sim 240$
t-tbar-Z	$\sim 4.3$
- Generation/simulation
  - t-tbar-H and t-tbar-Z generated with COMPHEP v41.10 + Pythia 6.158
  - Other Bckgds generated with Pythia
  - Simulated with SIMDET v4.
- B-tag
  - NN based, including Zvtop, impact parameter joint probability tag, mass and momentum of the vertex, etc.
  - Implemented in SIMDET by T.Kuhl

# Channels studied

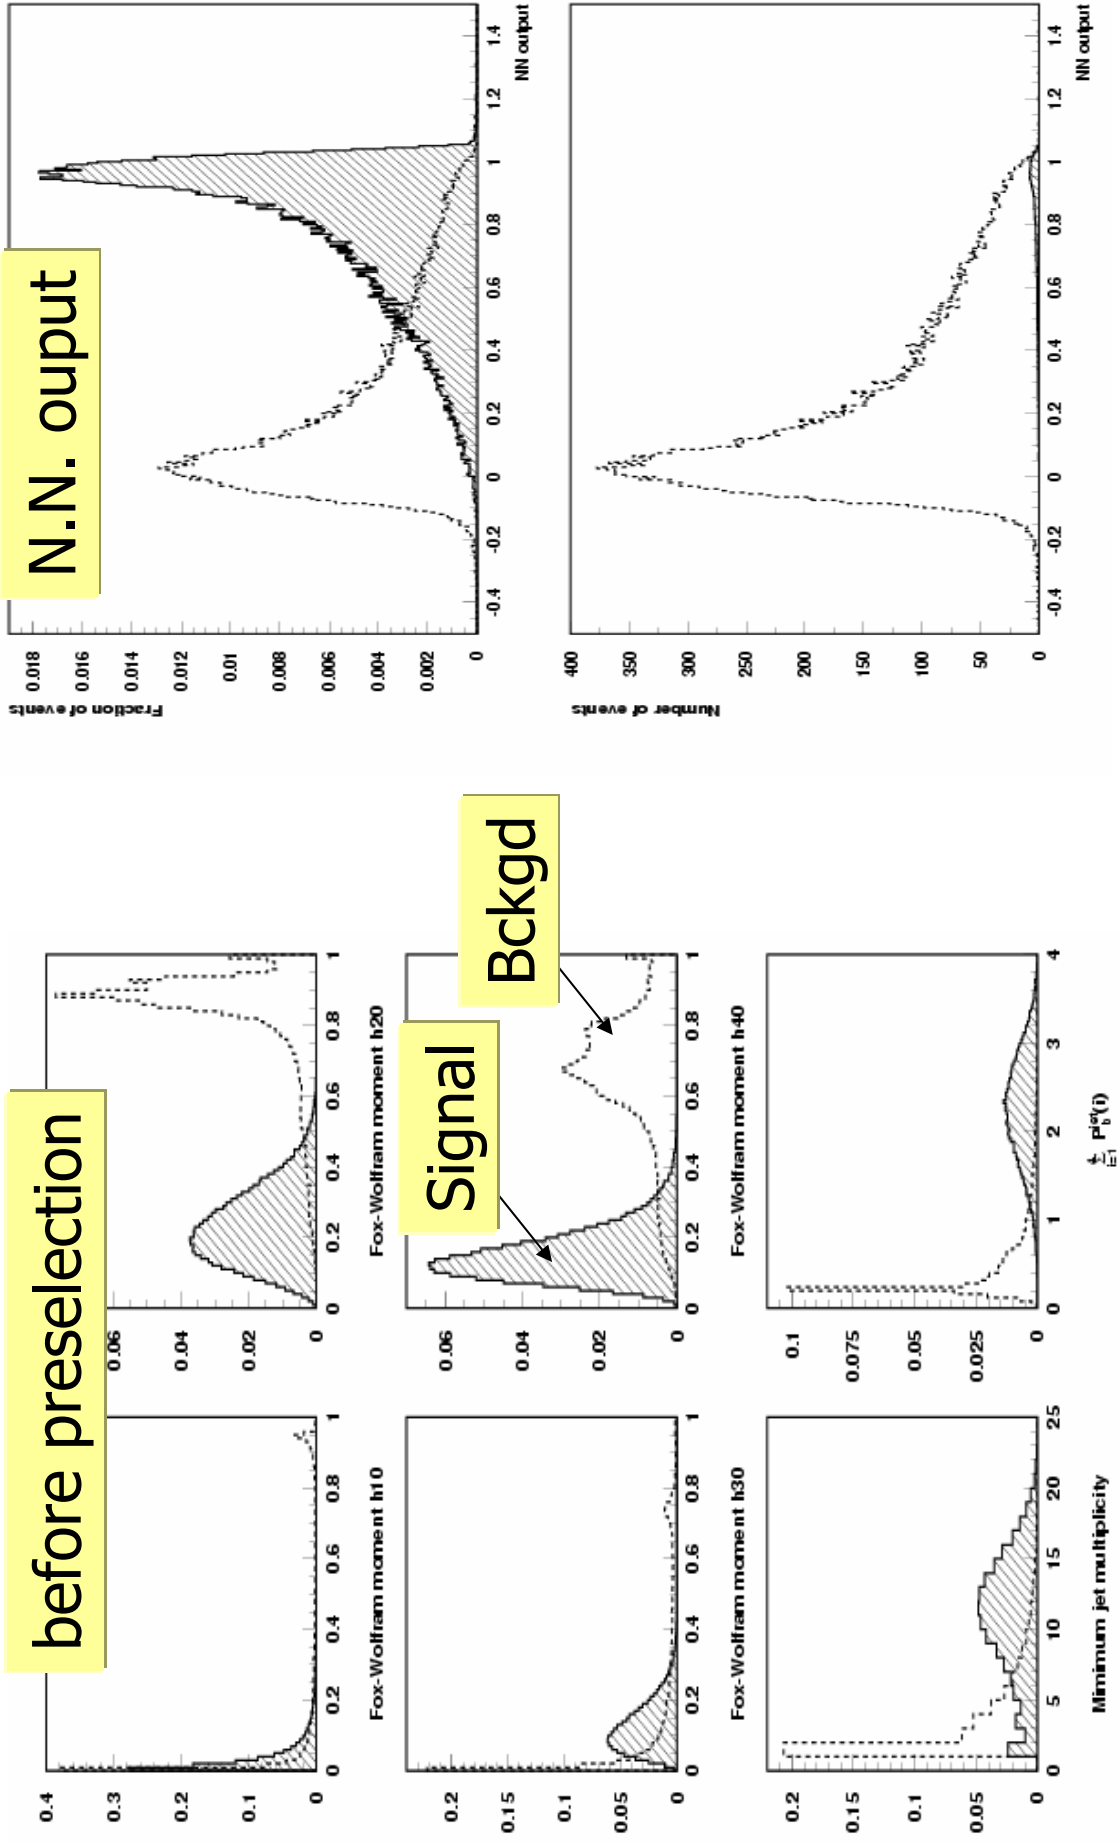

- $t\bar{t}H; (H \rightarrow b\bar{b})$ 
  - Semi-leptonic channel  $\rightarrow 4b2q1\nu$ 
    - $BR(tt\bar{b}H \rightarrow 4b2q1\nu) \approx 43.9\% \times BR(H \rightarrow b\bar{b})$
  - Hadronic channel  $\rightarrow 4b4q$ 
    - $BR(tt\bar{b}H \rightarrow 4b4q) \approx 45.6\% \times BR(H \rightarrow b\bar{b})$
- $t\bar{t}H; (H \rightarrow W^+W^-)$ 
  - 2 like sign leptons + 6 jets channel  $\rightarrow 2l^{+/-}2\nu4q2b$ 
    - $BR(tt\bar{b}H \rightarrow 2l^{+/-}2\nu4q2b) \approx 10\% \times BR(H \rightarrow W^+W^-)$
  - 1 lepton + 8 jets channel  $\rightarrow 1\nu6q2b$ 
    - $BR(tt\bar{b}H \rightarrow 1\nu6q2b) \approx 40\% \times BR(H \rightarrow W^+W^-)$

- **Neural Net selection**

- Thrust, number of jets, Fox-Wolfram M., b-tag prob., etc.

# 6 fermions background (1)

---

- Previous results don't include 6 fermions processes
- Cross-sections / generation with WHIZARD
  - At the partonic level
  - Include ISR and beamstrahlung
  - Hadronization and FSR done by PYTHIA
- Some processes receive contributions of resonant diagrams already taken into account with
  - $t$ - $\bar{t}$ ,  $W+W^-$ ,  $ZZ$ ,  $t$ - $\bar{t}$ - $Z$ ,  $t$ - $\bar{t}$ - $H$ 
    - In this case these contributions are subtracted from the total cross-section to avoid double counting
- Cross-section calculation and generation
  - Difficult and time consuming
  - Ambiguities arise when parton pairs are defined for fragmentation
    - Loss of resolution on the  $g_{\text{tH}}$  measurement due to 6 f. background is an estimate

- New top mass from Tevatron:
  - $m_t = 178.0 \pm 4.3 \text{ GeV}/c^2$ 
    - Changes the cross-sections to less than  $\sim 1\%$
    - Higgs mass limit  $\sim 250/340 \text{ GeV}/c^2$  @ 95/99% c.l.
    - Extension of the analysis to  $m_H \simeq 300 \text{ GeV}/c^2$
- Include the ( $H \rightarrow ZZ$ ) channel
  - $26\% \leq \text{Br} \leq 30\%$  for ( $200 \leq m_H \leq 300 \text{ GeV}/c^2$ )
  - 2 leptons + 8 jets channel  $\rightarrow l^+l^-6q2b$

## Conclusion

---

- @ the LC, the precision of the measurement of the top Yukawa Coupling will be better than  $\sim 10\%$  if  $m_H \leq 190 \text{ GeV}/c^2$
- For a light Higgs ( $m_H \simeq 120 \text{ GeV}/c^2$ )
  - Precision  $\sim 5-6\%$
- First 6-fermions background simulations affect only marginally the precision of the measurement
- The extension of the analysis is in progress (high masses, HZZ channel)
