

# **RPC DHCAL R&D in IHEP - Protvino**

**Vladimir Ammosov**

*Institute for High Energy Physics*

*Protvino Moscow region, Russia*

# Outline

- 1. Selection of DHCAL RPC performance**
- 2. Further R&D**
  - 5T mag field test**
  - mini DHCAL prototype**
  - 1 m3 DHCAL prototype**
- 3. Summary**

# DHCAL RPC performance

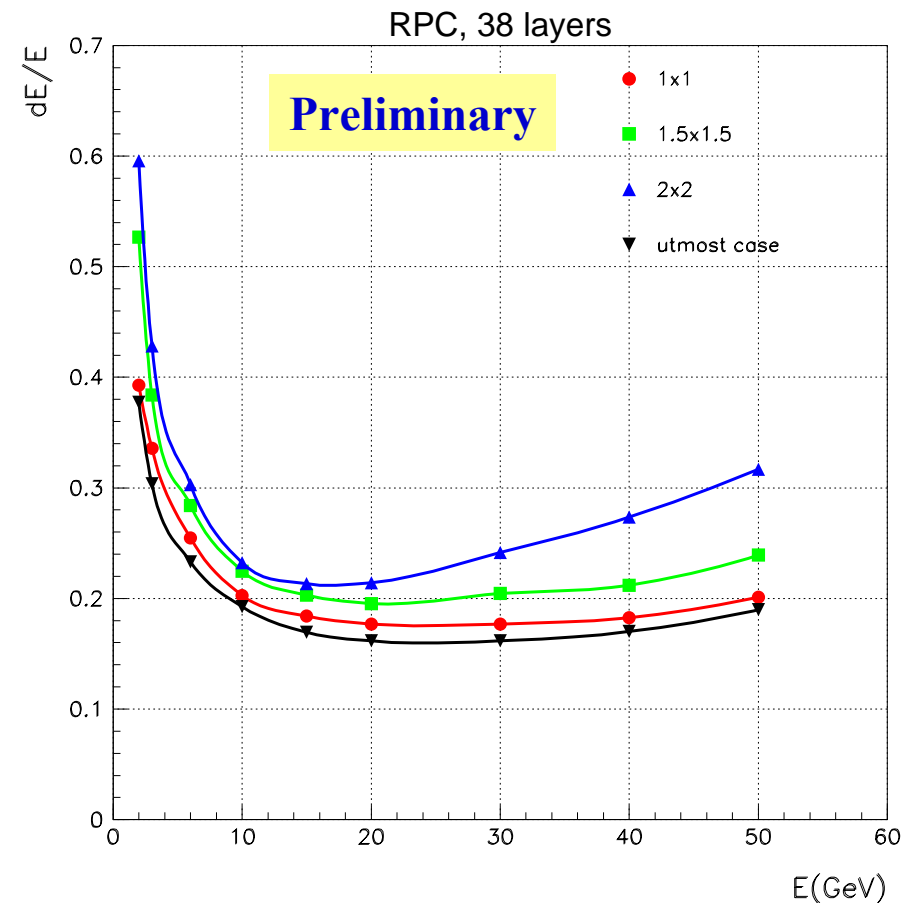

## RPC pad size

### GEANT 3.2 simulation of DHCAL response for pions

- 38 layers – 2cm SS absorber,  
6.5 mm RPC
- RPC – 1.2 mm gas monogap,  
TFE gas, glass as resistive plates
- MIP/2 cut
- nonlinearity is taken into account

**1x1 cm<sup>2</sup> pads case is compatible  
when all hits are counted**

**$R_M \sim 1.65$  cm**

# DHCAL RPC performance

## Gas mixtures

RPCs were tested in saturated avalanche and streamer modes

For both modes

TetraFluoroEthane (TFE) based mixtures were used

TFE = freon 134A =  $C_2H_2F_4$

~ 8 ionizations/mm

Saturated avalanche mixtures = TFE/IB/SF<sub>6</sub>

IB = Iso-C<sub>4</sub>H<sub>10</sub> as quencher, IB fraction = 5%

SF<sub>6</sub> as streamer suppressor, SF<sub>6</sub> fractions = (2-5)%

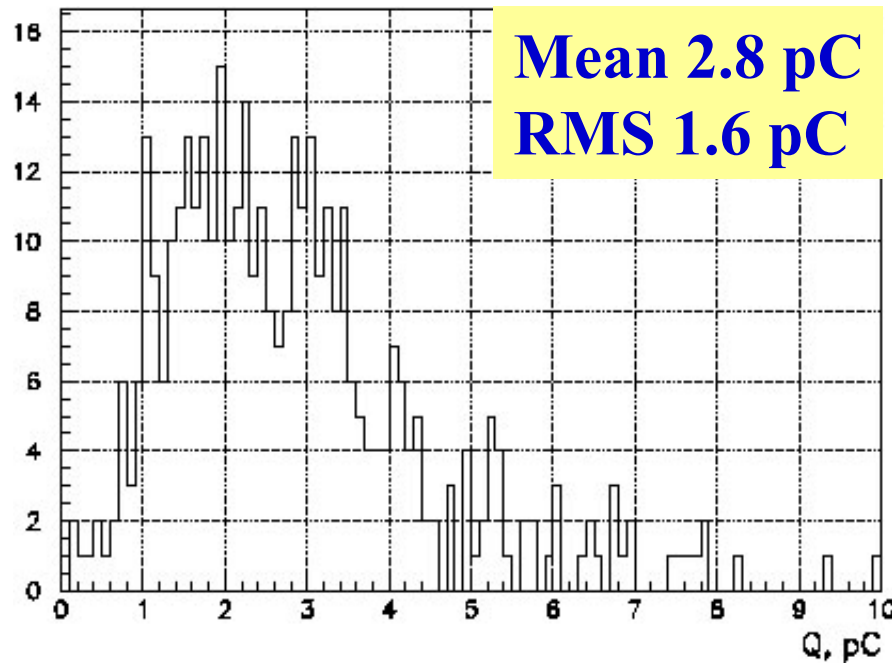

Streamer mixtures = TFE/IB/Ar or N<sub>2</sub>

IB = Iso-C<sub>4</sub>H<sub>10</sub> as quencher, IB fraction = (5-20)%

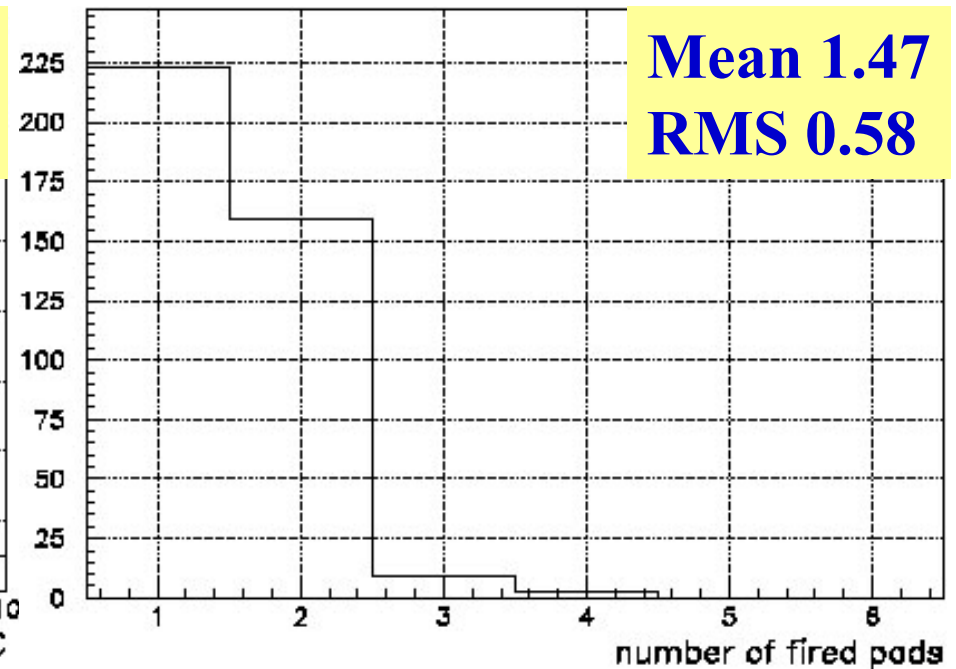

Ar/N<sub>2</sub> as streamer developer, fractions = (2-20)%

# RPC in avalanche mode

Typical Q and m distributions  
1.2 mm, 2% SF<sub>6</sub>, 8.4 kV - working point, 2.2 mV thr

$Q \sim 10^7 e$

2 adj pads

# RPC in avalanche mode

## 1.2 mm gap RPC

### eff, $\langle m \rangle$ vs HV

- 2% and 5% of SF<sub>6</sub>

Thresholds ○ - 0.6 mV

□ - 2.2 mV

△ - 5.0 mV

2.2 mV is best threshold

eff > 99%

low  $\langle m \rangle \sim 1.4$

For 2.2 mV

Knee

8.2 kV

8.6 kV

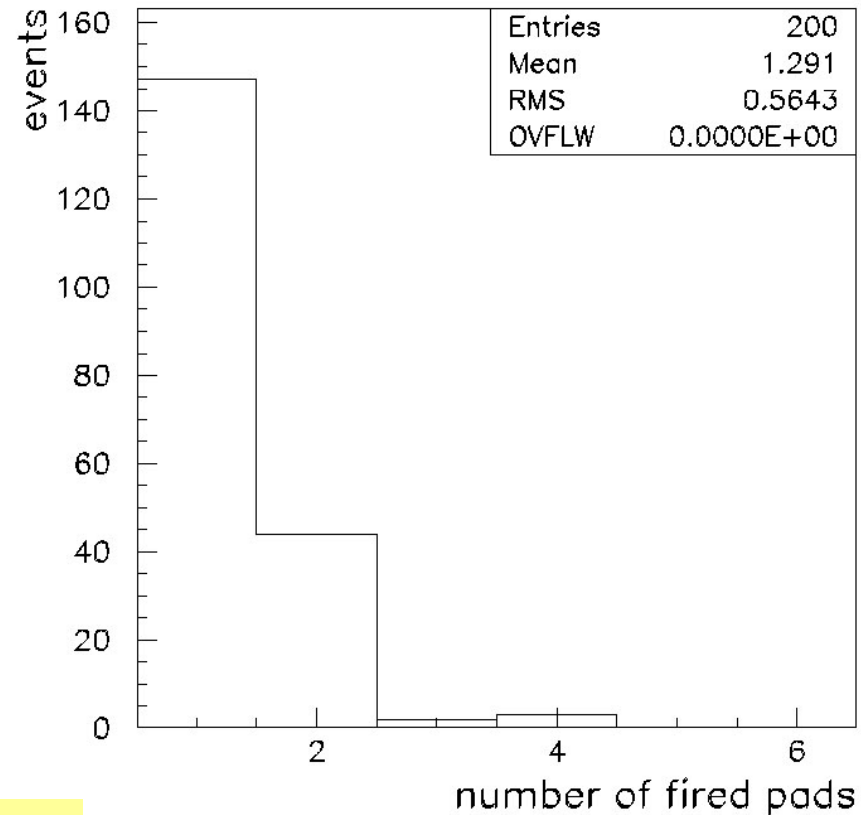

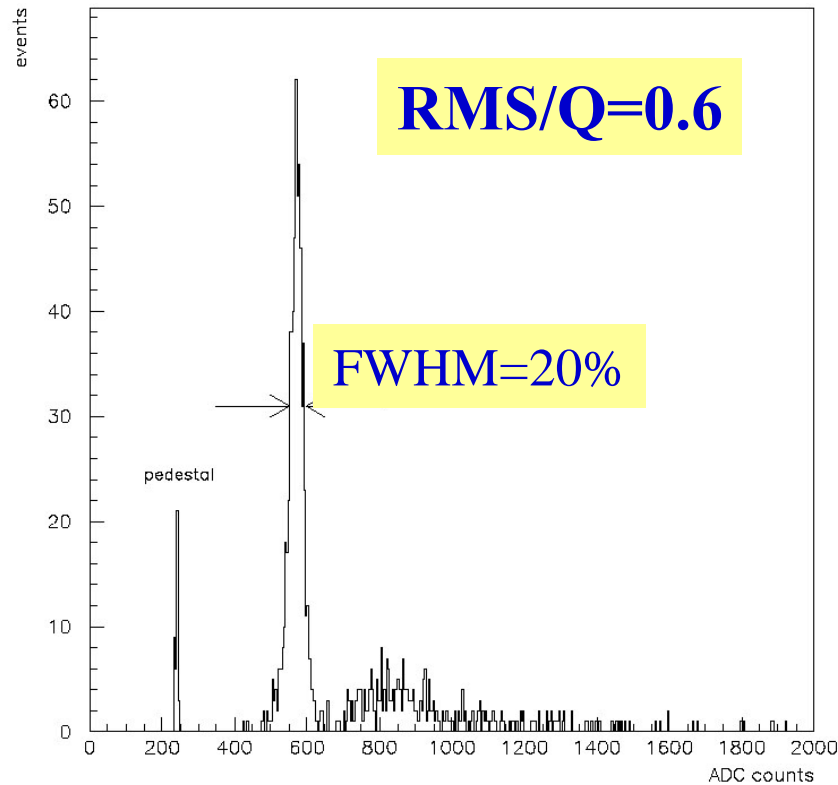

$\Delta V$

0.6 kV

0.6 kV

# RPC in streamer mode

Typical Q and M distributions, 200 V above knee  
1.2 mm gap, TFE/Ar/IB=80/10/10

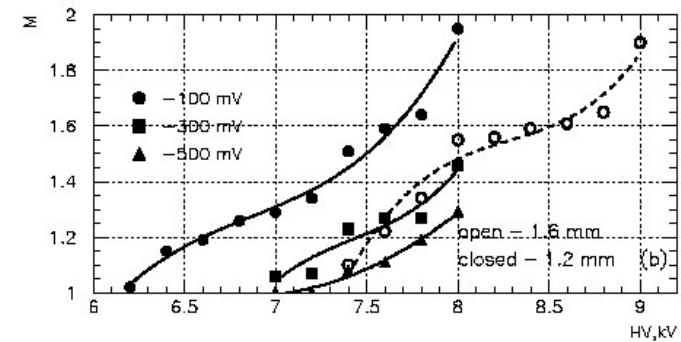

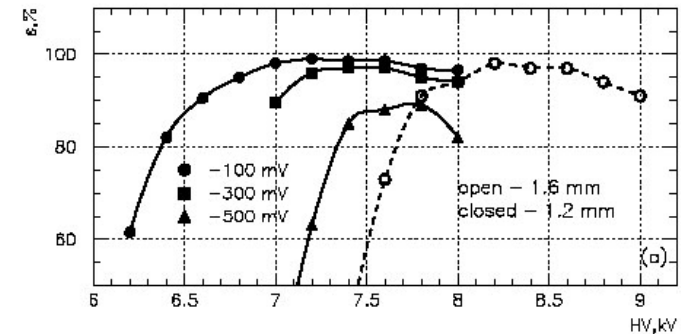

No ways to suppress multi streamer tail

# RPC in streamer mode

Eff, M and Q vs HV  
for 1.2 and 1.6 mm gaps  
Ar10 mix  
for different thresholds

best choice - thr = 300 mV

# Comparison of avalanche and streamer modes

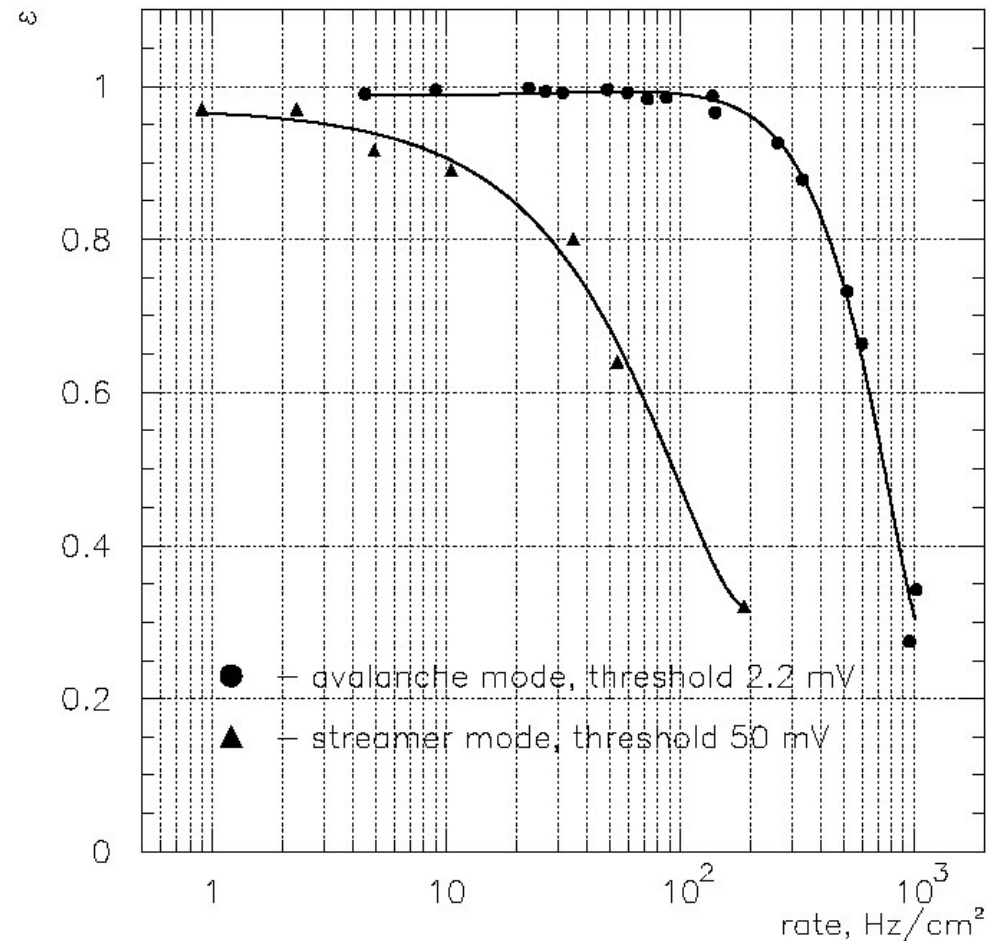

## Rate capability

streamer  $\sim 2-3 \text{ Hz/cm}^2$

avalanche  $\sim 100 \text{ Hz/cm}^2$

It is hard to work in streamer mode even for usual beam conditions

Streamer is suitable only for very low rates like  $e^+e^-$  FLC

# Comparison of avalanche and streamer modes

As example, for 1.2 mm gap

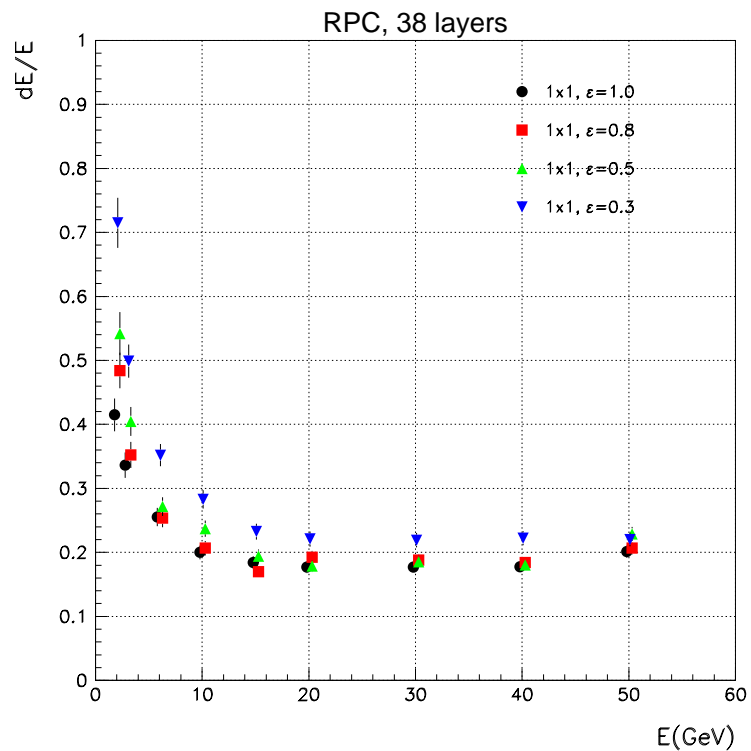

<b>№</b>	<b>Item</b>	<b>avalanche</b>	<b>streamer</b>
<b>1</b>	<b>Working mixture</b>	<b>TFE/Iso/SF6=93/5/2</b>	<b>TFE/Iso/Ar=80/10/10</b>
<b>2</b>	<b>HV working point, kV</b>	<b>7.4</b>	<b>7.4</b>
<b>3</b>	<b>Induced charge, pC</b>	<b>3.4</b>	<b>400</b>
<b>4</b>	<b>Threshold on 50Ω, mV</b>	<b>1-2</b>	<b>300</b>
<b>5</b>	<b>Efficiency, %</b>	<b>~98</b>	<b>~95</b>
<b>6</b>	<b><math>\sigma_Q / Q</math></b>	<b>~ 0.9</b>	<b>~ 0.6</b>
<b>7</b>	<b>Pad multiplicity</b>	<b>1.4-1.5</b>	<b>1.2 - 1.3</b>
<b>8</b>	<b>Noise, Hz/cm<sup>2</sup></b>	<b>~ 0.7</b>	<b>~ 0.1</b>
<b>9</b>	<b>Rate capability, Hz/cm<sup>2</sup></b>	<b>100</b>	<b>2 - 3</b>

# Summary of RPC features

No	Item	Value	Comments
1	Pad size	<u>1x1 cm<sup>2</sup></u>	1.6 mm can be used
2	Number of gaps	<u>monogap</u>	
3	Mode of operation	<u>saturated avalanche</u>	
4	Working mixture	TFE/Iso/SF6=93/5/2	
5	Gas gap	1.2 mm	
6	Resistive plates	thin glass, 10 <sup>13</sup> Ω·cm	
7	HV working point, kV	7.4	
8	Induced charge, pC	~3	
9	Threshold on 50Ω, mV	1-2	
10	Efficiency, %	~98	
11	HV plateau	~600 V	
12	σ <sub>Q</sub> / Q	~ 1	
13	Pad multiplicity	1.4-1.5 ?	
14	Noise, Hz/cm <sup>2</sup>	~ 0.5	
15	Rate capability, Hz/cm <sup>2</sup>	≤100	
16	Resistivity of HV coverage	> 10 <sup>6</sup> Ω/ sq	
17	Control of RPC work	<u>Q RO of cathode strips</u>	
18	Maximal own RPC thickness with 2 mm SS cups	<u>6 mm</u> <u>10 + 0.5 mm</u>	

# DHCAL RPC performance

## Geant3 simulations

It seems eff down to 80%  
does not hurt resolution much

It seems  $\langle m \rangle$  up to 1.4-1.5  
does not hurt resolution much

# Further R&D

## Assembly for 5T test

It was proposed to test RPCs in 5T magnetic field at DESY to check influence of electron spiralization

Here is our proposal for this test with 64 pad RPCs

Expected in May-June 04

# Further R&D

## 5T test

**Here is assembly which we would like to use**

# Further R&D

## 5T test

### 64 channel RO electronics

Analog part - Minsk old 8 ch. ASIC ANODE.  
New one is delayed up to May

Digital part – ALTERA FPGA

Sequential read-out to PC

Was tested with RPC satisfactory

Final PCB is under development

# Mini DHCAL prototype

To measure response for electrons with 10/20 layers  
sampling: 4/2 cm steel + 0.65 cm RPC plane  
sensitive area 9x9 cm<sup>2</sup> ( 8x8 pads of 1x1 cm<sup>2</sup>, 1 mm spacing)

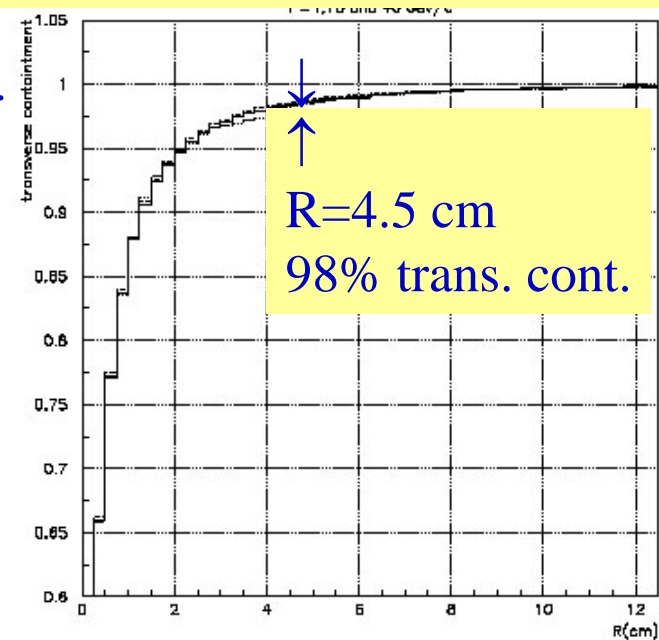

GEANT3 simulation of transverse containment

$p_e = 1, 10, 40 \text{ GeV}/c$

Diff.  
distr.

Trans.  
cont.

# Mini DHCAL prototype

**Goal – first digital measurements of electromagnetic showers and comparison with simulations.**

**Usage of minimal number of RO channels ! (640/1280 ch.)**

**Most hard case for digital calorimetry !**

# 1 m3 DHCAL prototype

## Design of 1 m2 RPC plane

1000x1030 mm<sup>2</sup> - lateral dimensions  
970 x 970 mm<sup>2</sup> – glass area  
960 x 960 mm<sup>2</sup> – sensitive area  
Weight ~ 40 kg

96x96 = 9216 anode pads in total  
8 anode RPC PBs of 240x530 mm<sup>2</sup>  
24x48 = 1152 pads on each

SS cups and Al bar frame form hermetic box.  
It prevents glass break due to gas overpressure.

# 1 m<sup>3</sup> DHCAL prototype

## Construction of 1 m<sup>2</sup> RPC plane

Gas volume: anode glass – 0.5 mm thick, cathode glass – 0.8 mm thick,  
1.2 mm gas gap, 6 mm dia spacers

# 1 m<sup>3</sup> DHCAL prototype

## Construction of 1 m<sup>2</sup> RPC plane

96x6 cm<sup>2</sup> strips for read-out

16 anode (x) strips

16 cathode (y) strips

# 1 m<sup>3</sup> DHCAL prototype

## Test of 1 m<sup>2</sup> RPC plane

Cosmic ray trigger

Using scint counters

96x6 cm<sup>2</sup>

2 counters - top

1 counter – bottom

TFE/IB/SF<sub>6</sub>=90/5/5

gas mixture

# 1 m3 DHCAL prototype

## Test of 1 m2 RPC plane

eff ~ 94 %  
spread +/- 2% (non uni)

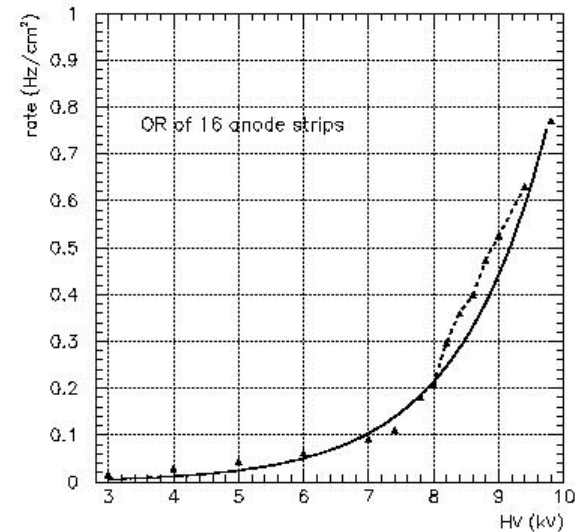

# 1 m3 DHCAL prototype

## Test of 1 m2 RPC plane

Current  $\sim 1 \mu\text{A}/\text{m}^2$   
at working HV = 9 kV

Noise rate  $\sim 0.5 \text{ Hz}/\text{cm}^2$   
At working HV = 9 kV

# Summary

## 1. Selection of DHCAL RPC performance

**1.2 mm monogap glass RPC, saturate avalanche mode**

## 2. 1m<sup>2</sup> RPC plane

**robust design, eff~94%, non uni <2%**

## 3. Further R&D

- 5T mag field test **June04**
- Mini DHCAL test in e-beam **Dec04**
- production of 40 units of 1m<sup>2</sup> RPC planes  
for 1m<sup>3</sup> DHCAL prototype **Apr05**
- beam tests of 1m<sup>3</sup> DHCAL prototype **Dec05**
