

The integrated PDF is well constrained.

How well do we know the uPDF at small transverse momenta.

The integrated PDF is well constrained.

How well do we know the uPDF at small transverse momenta.

What is the typical evolution path?

DGLAP?

The integrated PDF is well constrained.

How well do we know the uPDF at small transverse momenta.

What is the typical evolution path?

DGLAP? Or BFLK/CCFM/LDC?

p_{\perp} -distribution of Z^0 at the Tevatron vs. KMR uPDF
(from Martin, Ryskin, Watt)

p_{\perp} -distribution of Z^0 at the Tevatron vs. KMR uPDF
(from Martin, Ryskin, Watt)

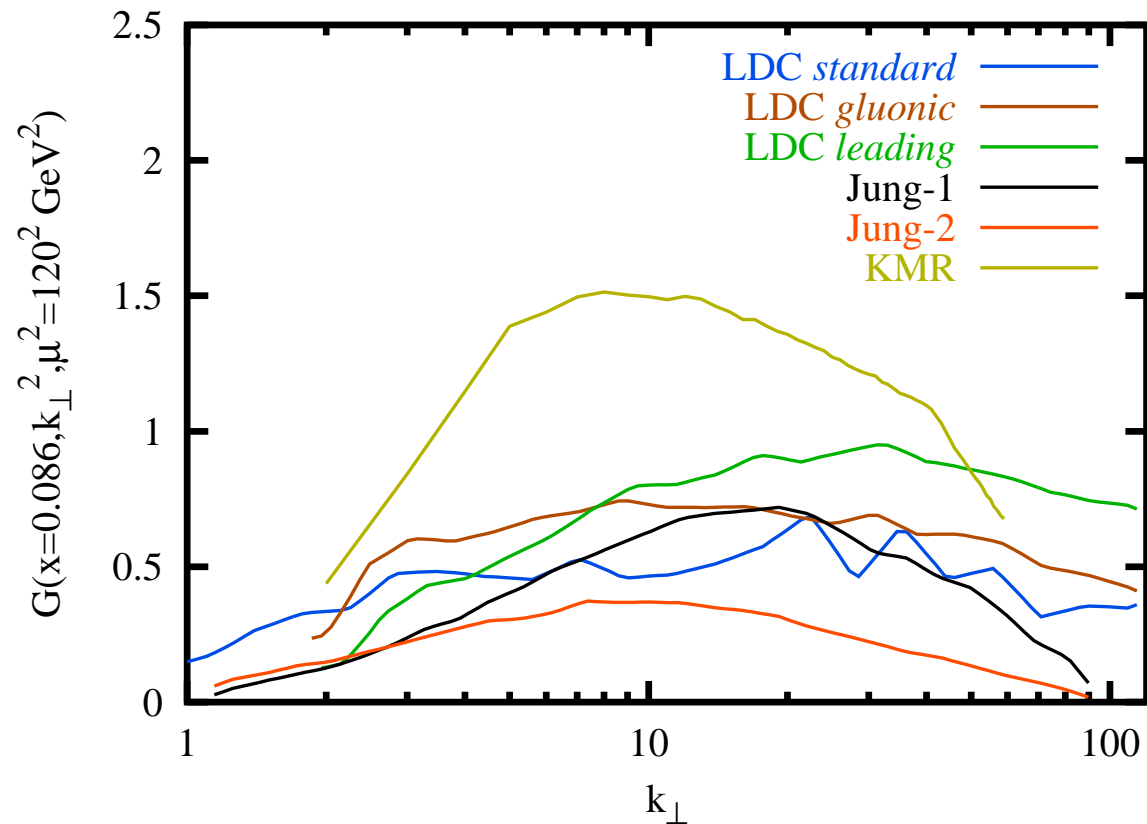

Consistent with findings of standard DGLAP Parton Showers which need an intrinsic k_{\perp} of 1 – 2 GeV. (For quarks.)

For $\mu^2 = m_H^2$ and $x = m_H/W_{LHC}$ there are large differences in shape and normalization for different uPDFs

Also large differences in the inclusive luminosity function (LHC).

$$\frac{d\sigma_H^{\text{incl}}}{dM^2 dy} = \frac{d\mathcal{L}_{\text{incl}}}{dM^2 dy} \hat{\sigma}_{gg \rightarrow H}(M^2), \quad M^2 \frac{d\mathcal{L}_{\text{incl}}}{dM^2 dy} = L_{\text{incl}} = xg(m_H/W, m_H^2)^2$$
