

Is Factorization Broken?

Michael Klasen
HERA-LHC Workshop
11 october 2004

- Theory: “Though shalt not suppress the direct contribution.”
- Experiment: “We can do that anyway and fit our data!”

Multi-Pomeron Exchanges

Direct photoproduction:

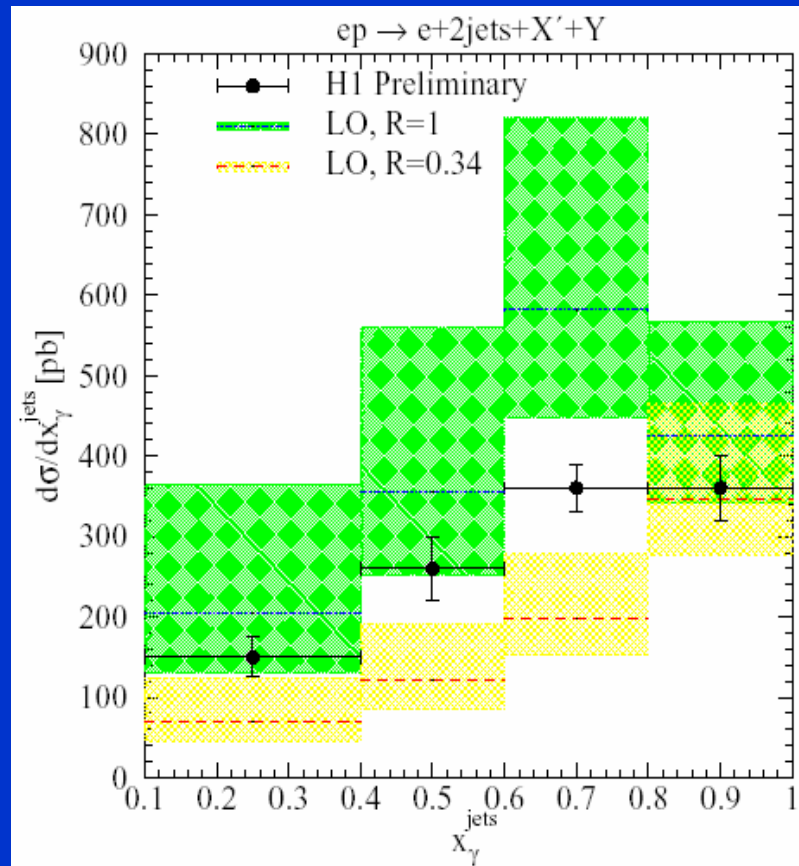

→ Modification of the Regge trajectory

Resolved photoproduction:

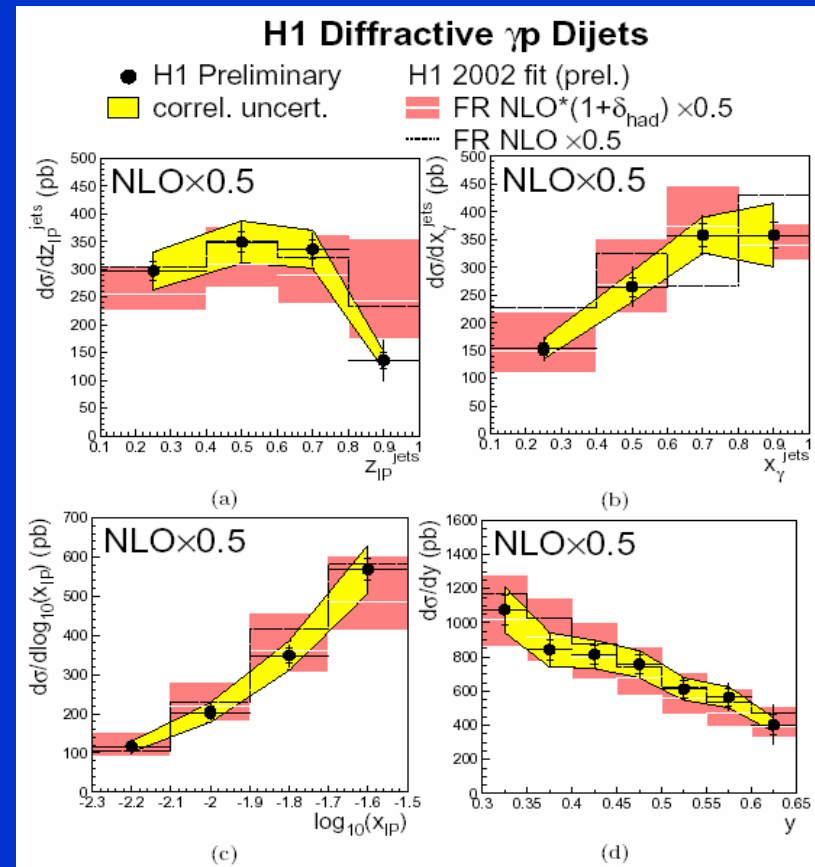

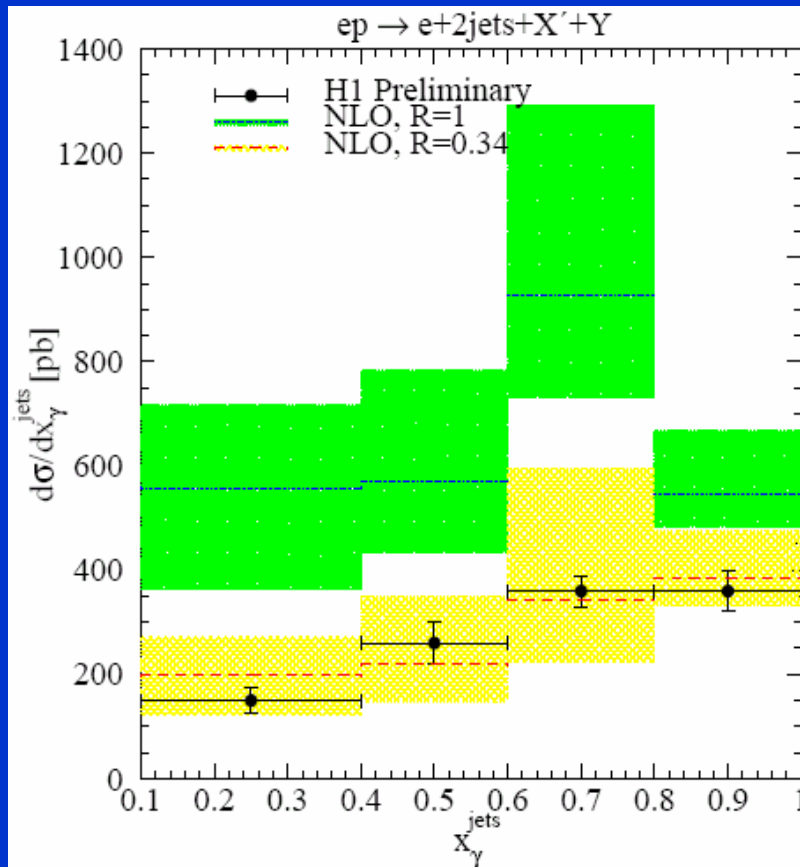

→ Factorization breaking

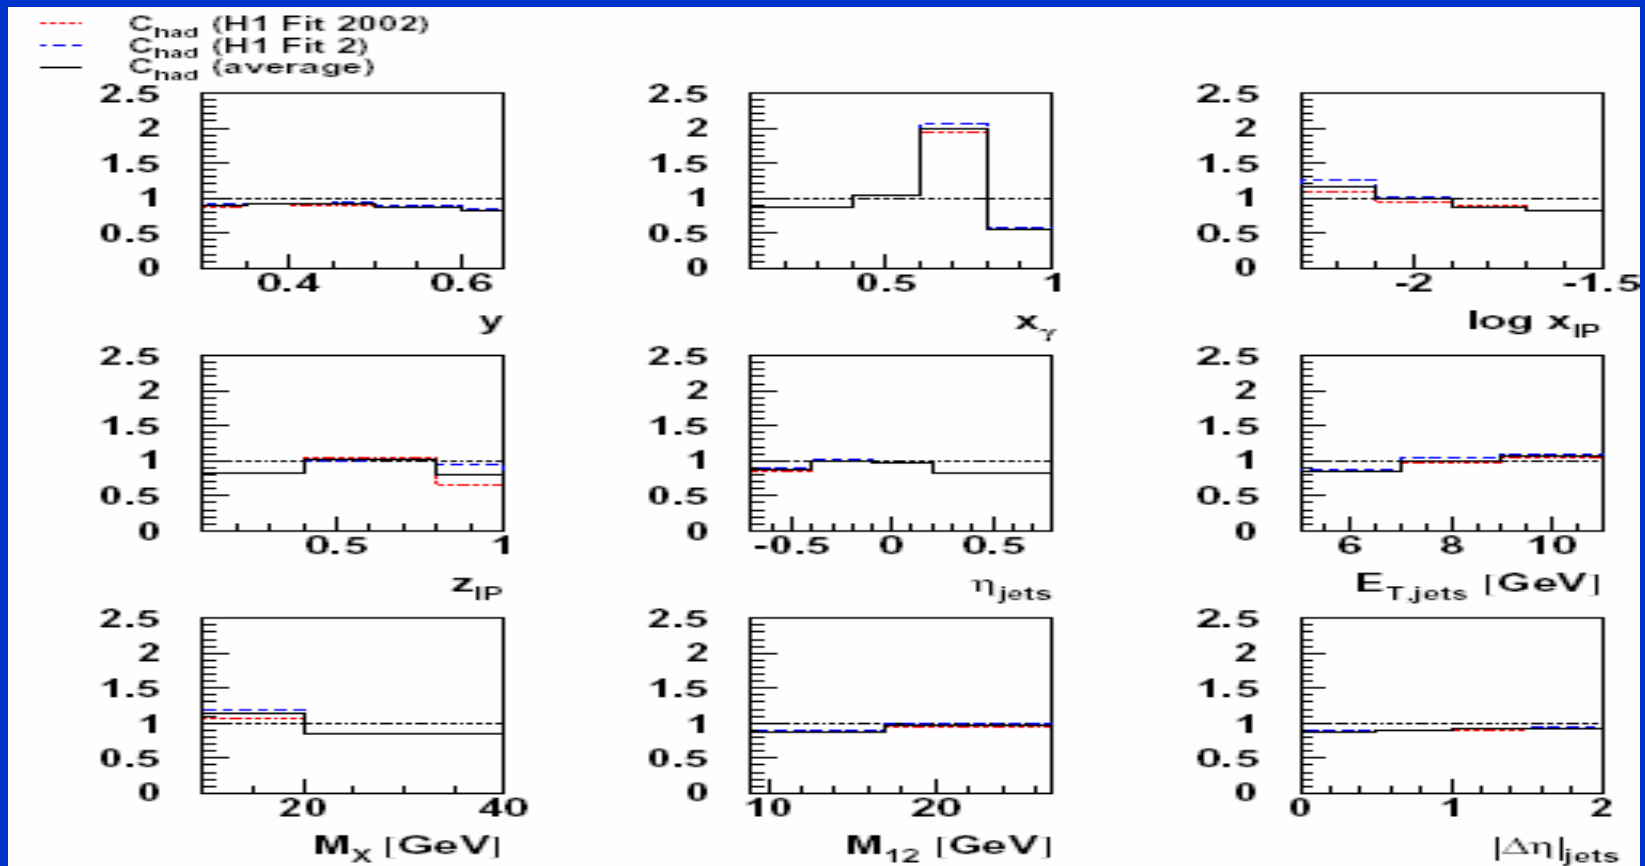

Photoproduction at LO: No Evidence for Factorization Breaking

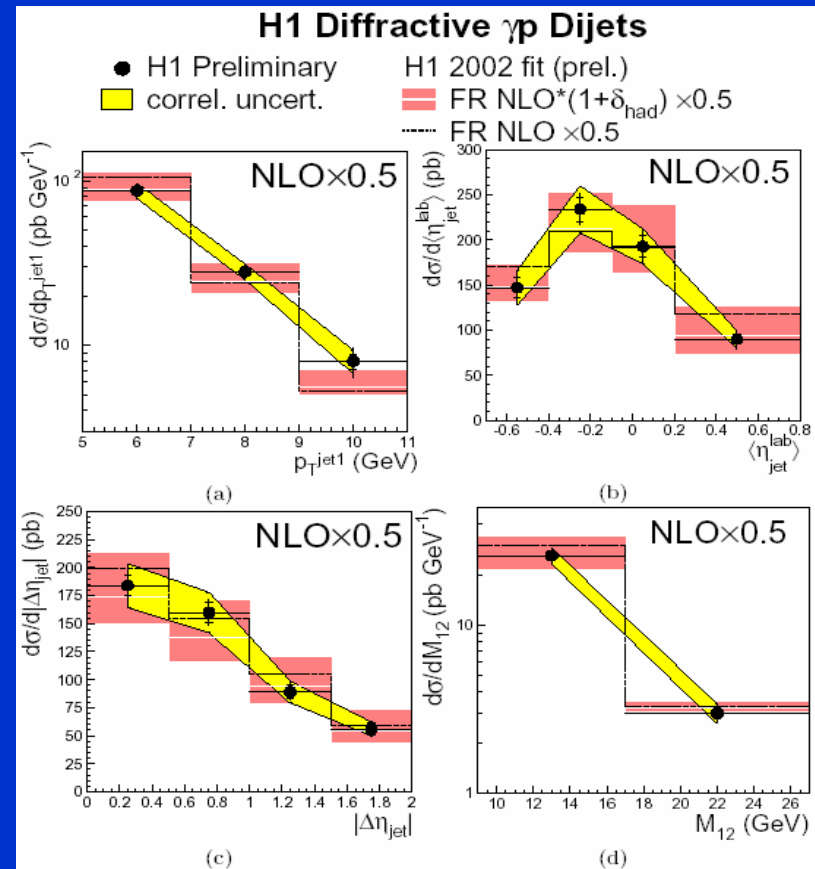

Photoproduction at NLO: Large K-Factor \leftrightarrow Survival Probability

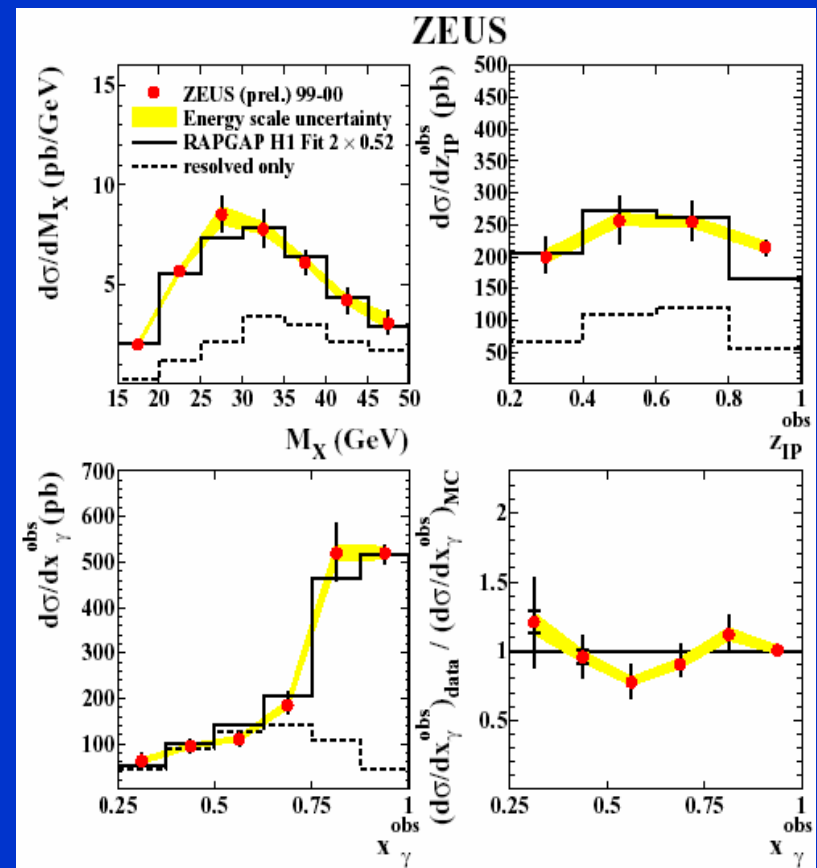

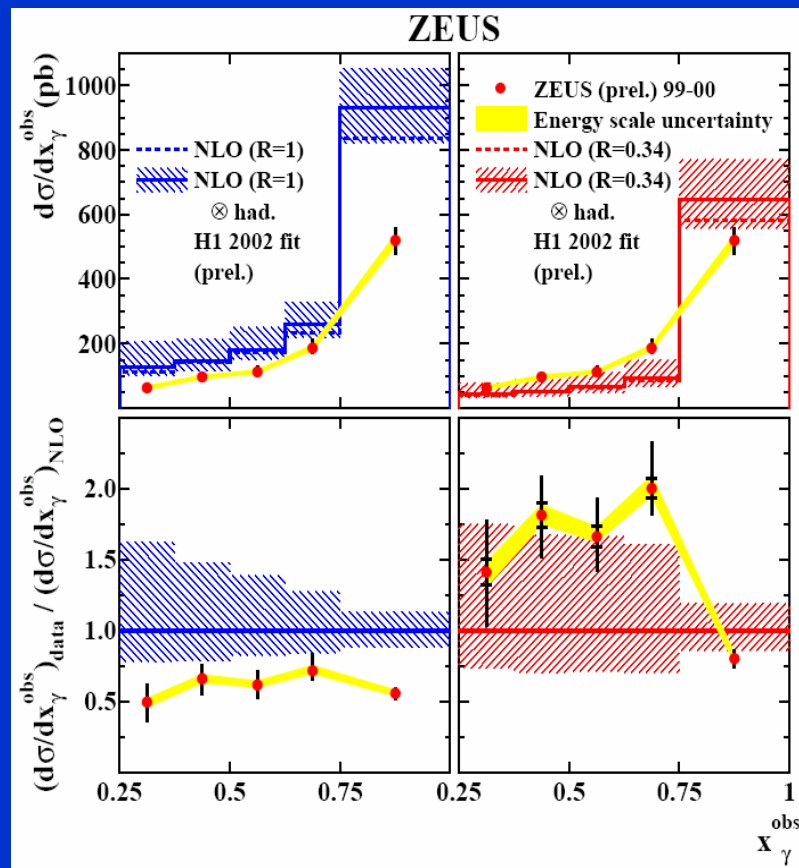

Hadronization Corrections: Observable- and Model-Dependent

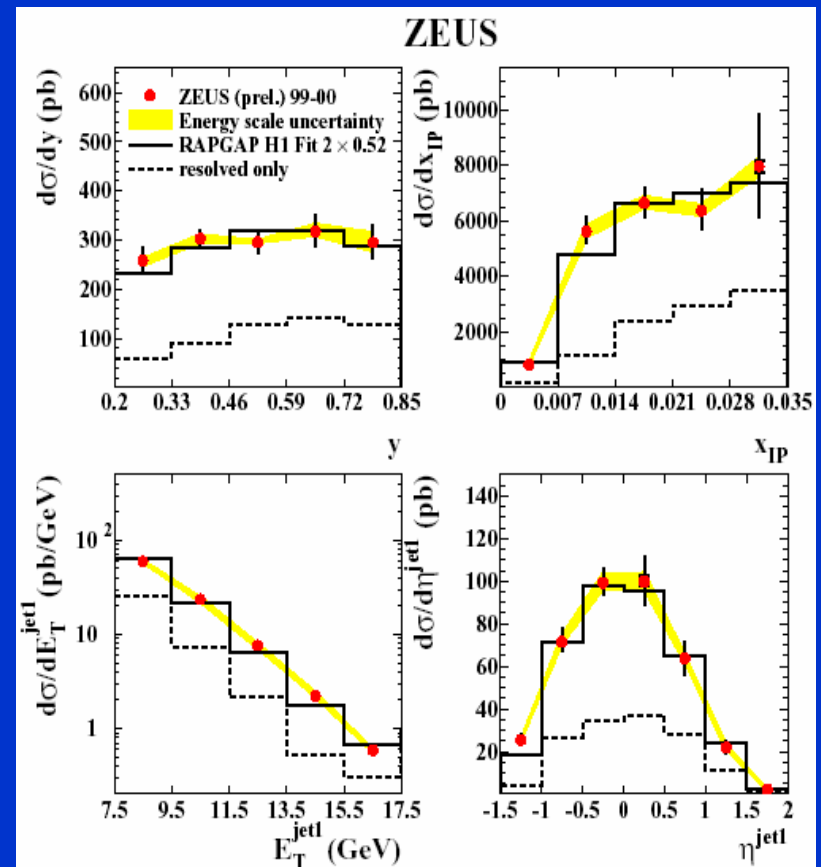

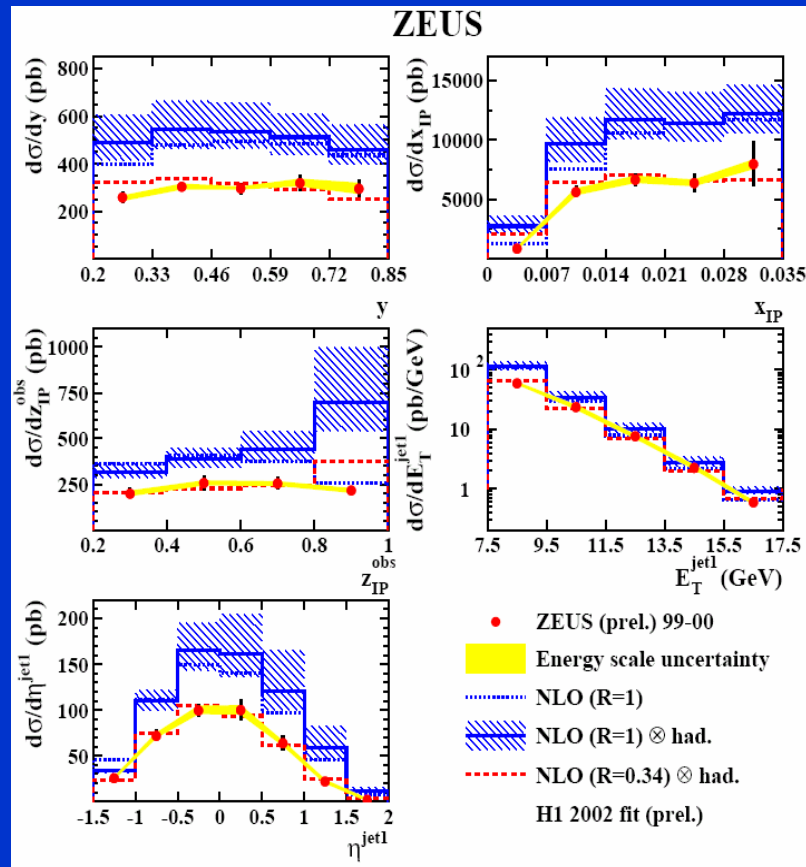

Direct Photoproduction: Should Dominate at Large E_T

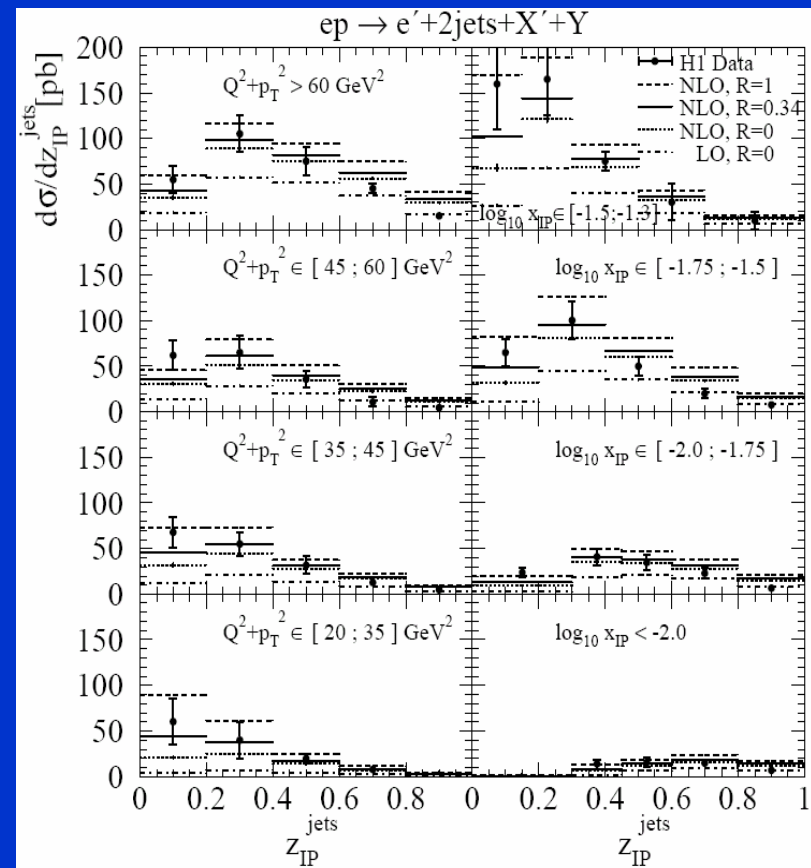

ZEUS Analysis (1)

ZEUS Analysis (2)

High- to Low- Q^2 Transition in DIS: From Factorization to its Breaking

Discussion

H1 photoproduction: FR (although KK available since 01/04)

- No theoretical motivation for direct suppression
- Separate direct/resolved by $x_\gamma < > 0.9$
- Do not suppress resolved for $x_\gamma > 0.9$ by $R=0.34$

ZEUS photoproduction: KK

- LO Monte Carlo, known to be unreliable in normalization
- Conclusion based only on x_γ observable

H1 DIS: DDISENT

- DDISENT, based on x_{iP} -slicing, no convolution
- Fixed renormalization scale
- Direct only known to be insufficient for forward jets

Outlook

Experiments:

- Make data and parton densities available -- soon!
- Reanalyze dijets in photoproduction for higher E_T
- Measure ratios of diffractive/inclusive cross sections (at high E_T)
 - Photon PDF uncertainties cancel
 - Hadronization corrections cancel
- Analyze dijets in DIS (ZEUS)

Theory:

- Understand hadronization corrections
- Repeat NLO analyses with ZEUS and MRW partons
- Examine other, more discriminative observables
