Purpose

- High-counting rate and high-resolution neutron detectors are required for the J-PARC neutron scattering facility.
- Low-cost reliable modules for neutron spectrometers

Reconsideration of Linear PSD

- Fast He-3 tubes
- Replace anode wires with high-tech plate
- Easy to maintain

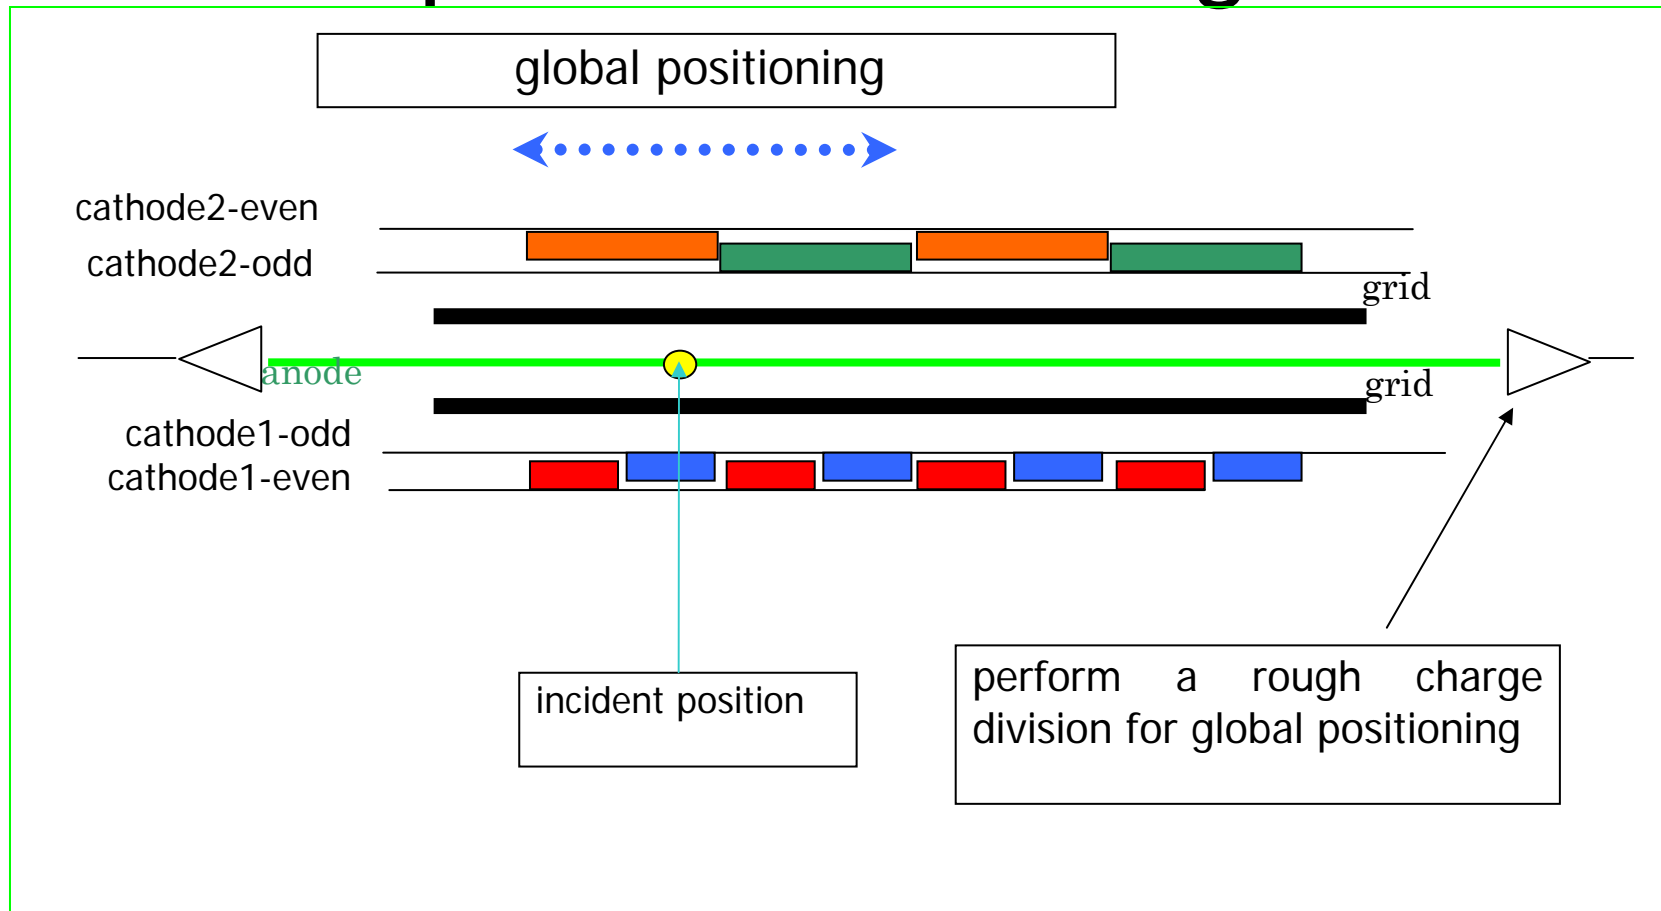

- Simple replacement of anode wires with anode strips is easy, but

RESISTIVE CHARGE DIVISION METHOD is not compatible with High counting rate operation

- Take advantage of microstrip plate
 - Cathode signal is usable.

The use of cathode signal to position encoding

8cm long test plate

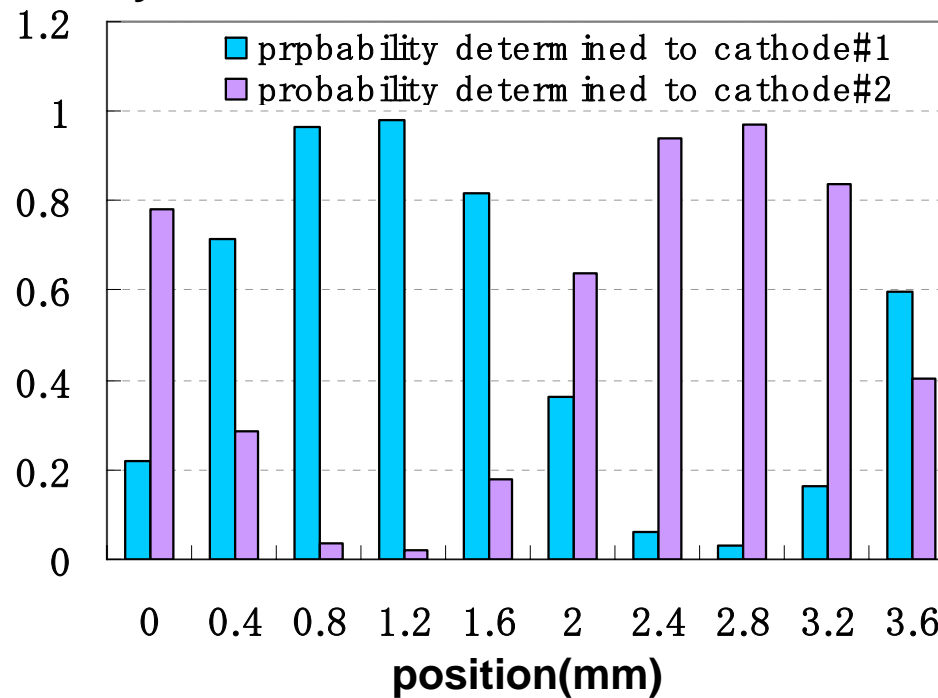

Neutron beam test

Electrode pattern

probability

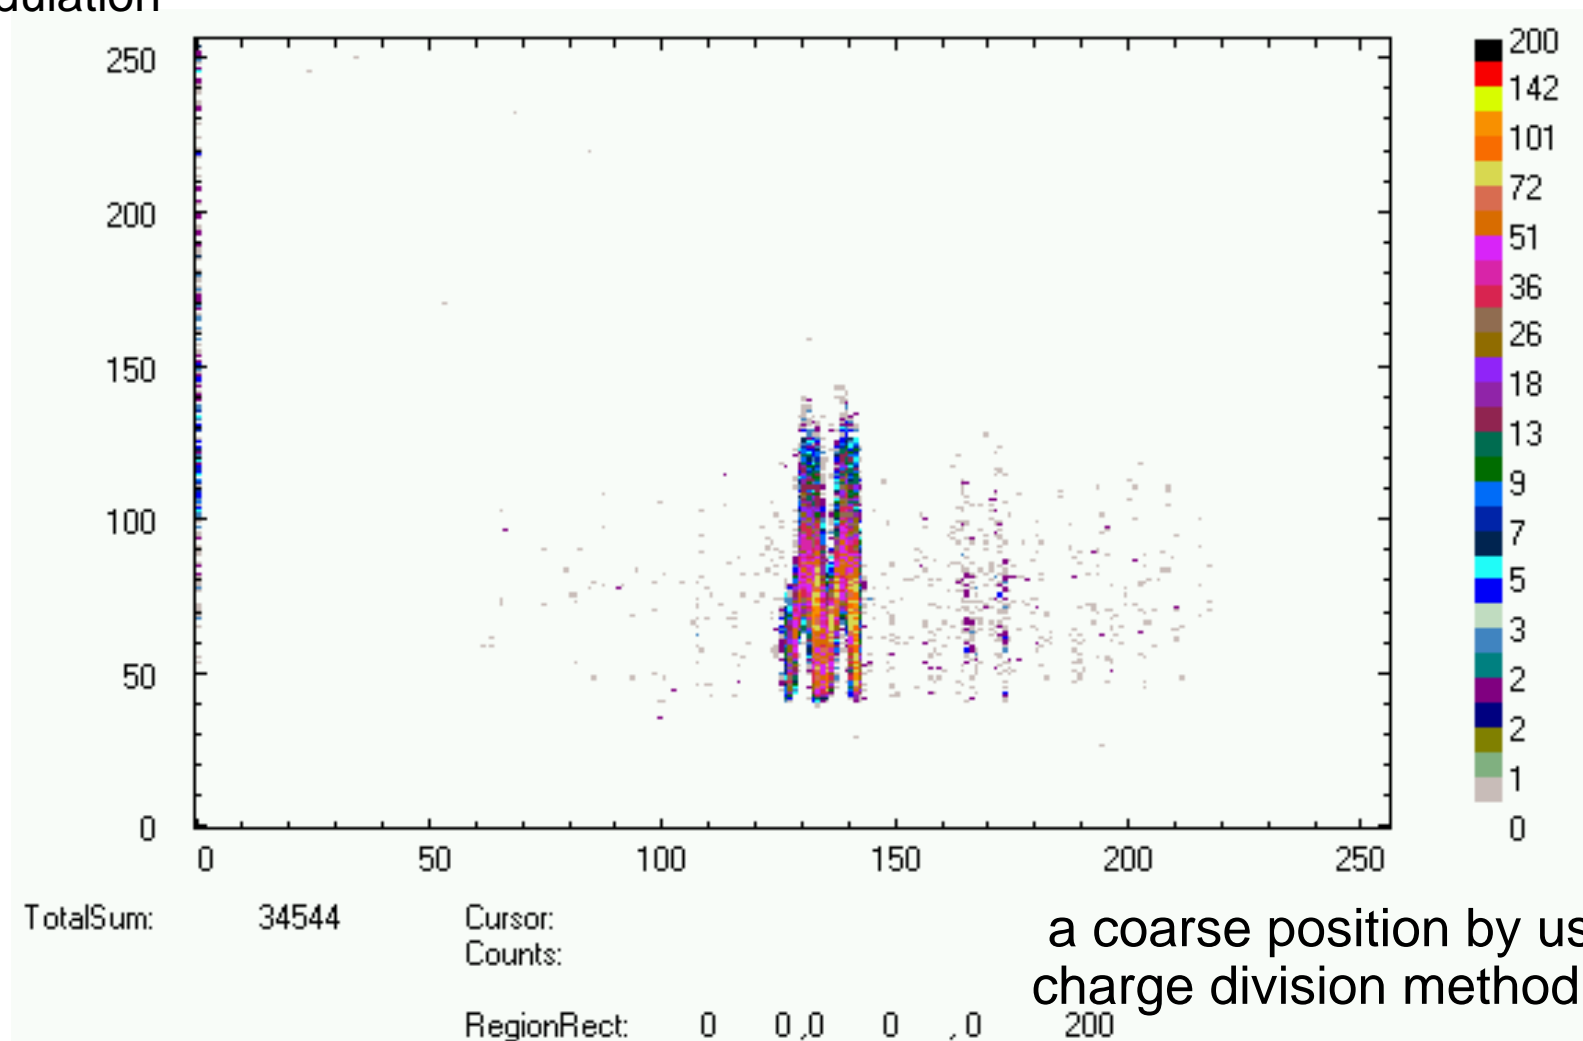

CF₄ 4bar
³He 0.3bar

Distortion free
High resolution

Trace (800um)

Cathode modulation

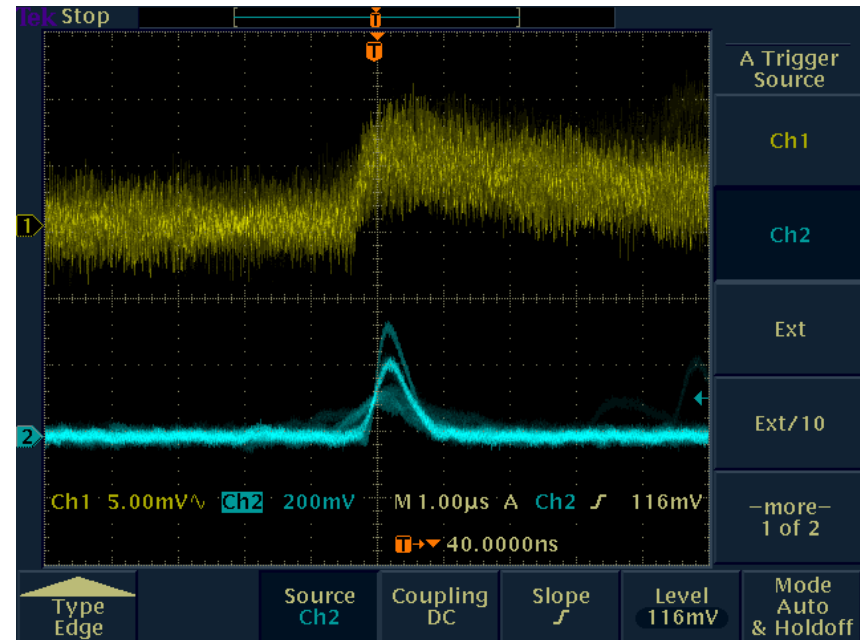

Plate

328mm long 16mm wide 32mm H He-3 : 3 atm CF4 : 2 atm

Neutron beam test

Global-Local Grouping (GLG) Method

The principal of G-LG method is using global and local signals to locate the position :

- ❖ **Global information** is used to define the **coarse position**
- ❖ **Local information** is used to define the **fine position in the coarse position**

Development of Long MSTube

Futaba electric has a special very long exposure process used for linear scale (Up to 3 m).

- Resistive charge division requires high gas gain
- Single-end packaging is preferable
- Extension of cathode signal encoding method with GLG method

Global Local Grouping (GLG) Method

Separate total charge into two parts: **Global** and **Local**

- ❖ **Global information is used to obtain coarse position**
- ❖ **Local information is used to obtain fine position**

New Micropattern Global-Local Charge Division

Let us assume

Total length: 640 mm

S/N = 40:1

Achievable resolution = 640/40

→ $\Delta x = 16\text{mm}$

Half cathode S/N = 20:1

→ $\Delta x = 32\text{mm}$

The other half cathode S/N = 20:1

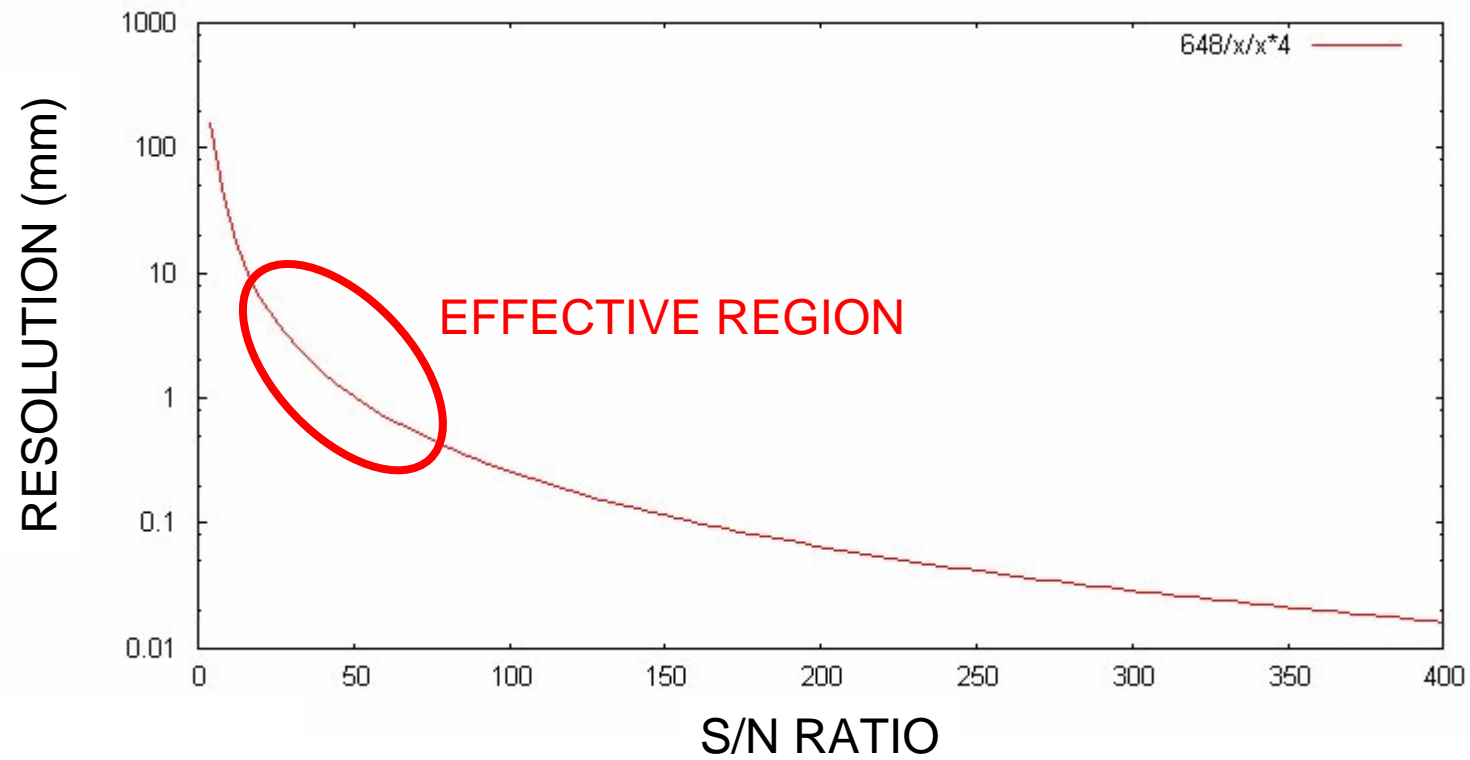

→ $\Delta x = 1.6\text{mm}$

x 10 resolution is expected

Zig-Zag + Stepwise -> Pseudo gray code encoding

ACHIEVABLE RESOLUTION vs S/N RATIO

Test plate

- Sensitive length ~ 648 mm.
- 2 or 4 Anodes (3mm pitch) and 4 grids.
- Global pitch ~ 35mm.
- Global – Local pad layout

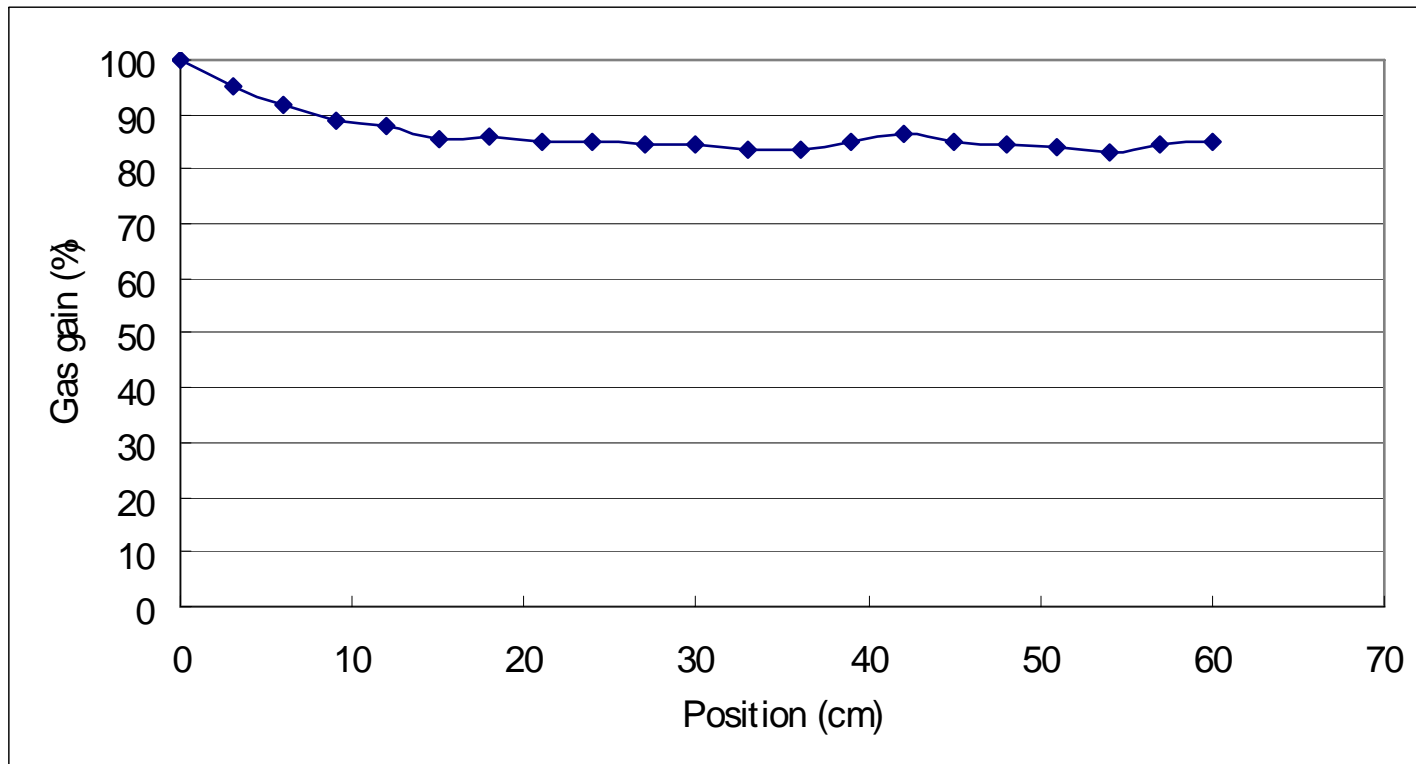

Global

Local

UP TO ~3m is possible

First lot had high anode resistance problem

➤ 17% of gain difference.

➤ Rise time greatly varied with position (from 0.3 to 5us.).

Reduced to 1/5 in the second lot

Synchrotron Experiments

- ◆ Tested at KEK Photon Factory, BL-14A.
- ◆ bBeam energy 8keV.
- ◆ Beam size 400 $\mu\text{m}\phi$.

Energy resolution

8keV X-rays

Gas gain: 6000

13.3% (FWHM)

Global position spectrum

68mm FWHM

Local scan test

1-4 mm (FWHM) resolution

Global - Local relationship

Improvement of the detector

- Divide global to $\frac{1}{2}$ \rightarrow x 4 resolution
- 2nd lot

FIRST NEUTRON BEAM TEST with second lot

- ^3He 0.5bar + CF_4 2.5 bar

GAS GAIN > 300

CHARGE SENSITIVE AMPLIFIER OUTPUT SIGNAL

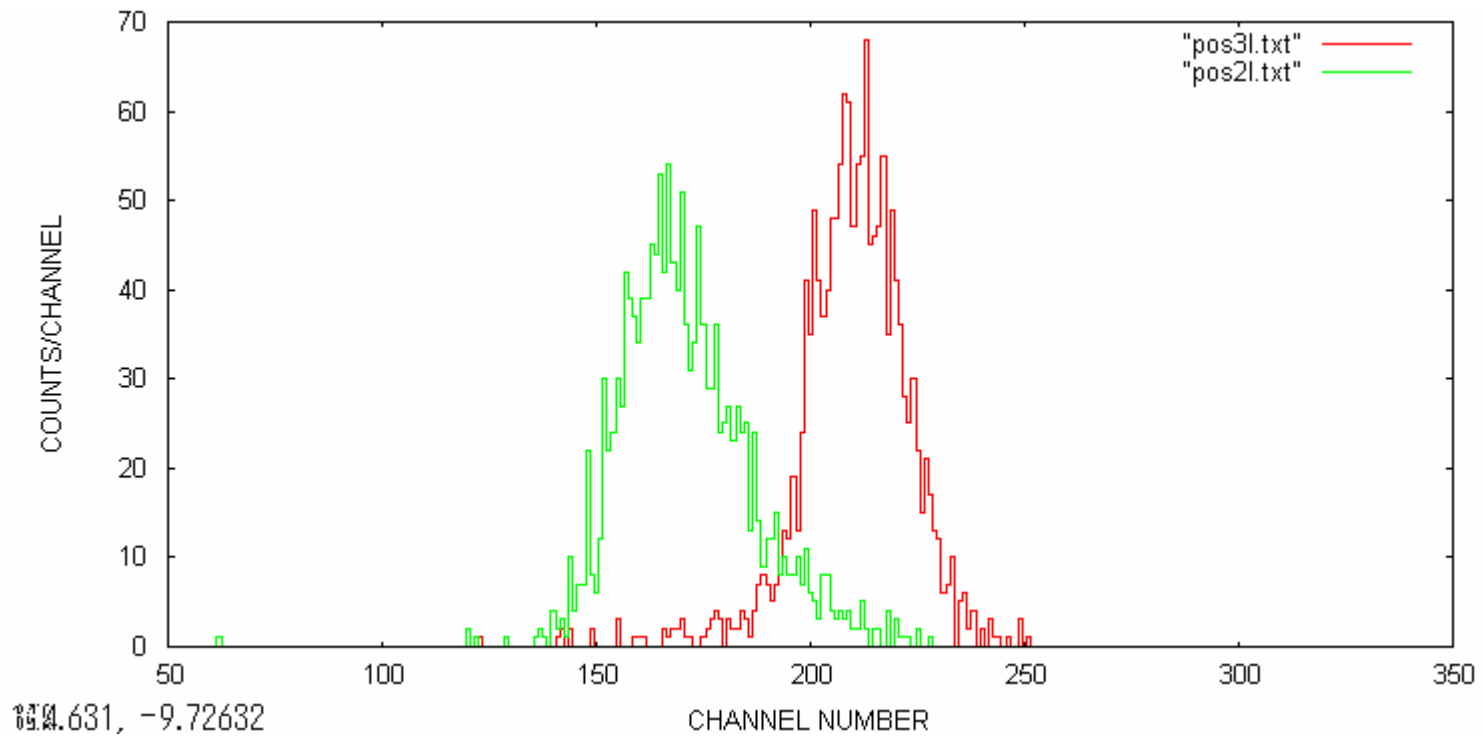

GLOBAL POSITION TEST

LOCAL POSITION TEST

8mm
↔

Summary

- A new 1-D microstrip gas counter using global-local charge division method is developed.
- 64cm long tube is fabricated and successfully tested with a neutron beam.
