

Discovery channels investigated by CMS

- Light H^\pm ($< M_{\text{top}}$)

$gg(qq) \rightarrow tt \rightarrow H^\pm W^\pm bb$

$H^\pm \rightarrow \tau \nu$

- $W^\pm \rightarrow l \nu$ (*M. Hachemi, A. Nikitenko*)

final state : 1 τ , 2b, 1 lepton
lepton trigger

- $W^\pm \rightarrow qq$ (*S. Perries*)

final state : 1 τ , 2b, 2 light-jets
transverse mass reconstruction
with MET + τ -jet

- main background :

$tt \rightarrow W^\pm W^\pm bb$

Discovery channels investigated in CMS

- Heavy H^\pm ($>M_{\text{top}}$)
production : $gb \rightarrow H^\pm t$
 - $H^\pm \rightarrow \tau \nu$ (*R. Kinnunen*)
final state : τ, b, MET
 - $H^\pm \rightarrow tb$ (*S. Lowette*)
final state : $3b$ or $4b$

Intermediate region

- goal : cover the region around the top mass
- $gg \rightarrow tH^\pm b$ leads to the same final state as $tt \rightarrow WH^\pm bb$
- For $gb \rightarrow tH^\pm$ we will use Tilman Plehn NLO cross section calculation (hep-p/0312286)

Generation of events

- $gb \rightarrow tH^\pm b$ implemented in pythia

Alwall and Rathsman, hep-ph/0409094

- external process pythia 6.226

ISUB=401,402 ! gg(qq)->tHb

- generated with $t \rightarrow Wb$, $W \rightarrow lv$.

- generation in progress for purely hadronic final state.
