

MUON trigger chambers efficiency and quality
with upstream reconstructed tracks

Inverse HLT algorithm ?

ALICE-INT-2002-04 version 1.0

F. Manso and the Clermont-Fd ALICE group

The Purpose

We have MOOD online to check the trigger information:

- uniformity of hit strips (dead channels, etc.)
- re-apply the trigger algorithm (by software) and check the trigger decision

In addition:

- the event reconstruction provides the tracks which are “susceptible” to give a trigger, and we can check if the raw data contains a corresponding trigger information
- furthermore we can check if the trigger information is what expected
- we can do this on a kinematics basis, once we have the reconstructed momentum

The Method

Use the straight part of the tracks in the last 2 tracking stations (4 chambers) and propagate them over the distance to the trigger chambers through the muon filter

The MUON Arm Tracker and Trigger

The uncertainty of the method...

The multiple scattering in the iron wall (muon filter)
between the tracking chambers and the trigger chambers

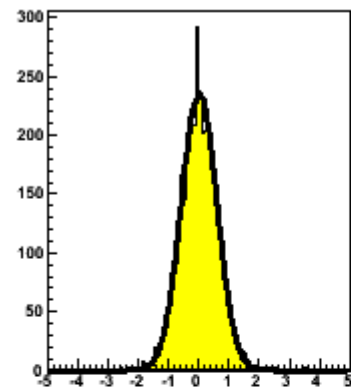

... and what else could have happened to the track in the filter ...

Event Display Example with a 20 GeV/c muon

Uncertainty due to multiple scattering

distance from the prolongation impact point to the real MC hit
(20 GeV/c muon)

MT11 $X_{\text{fit}} - X_{\text{hit}}$ $\sigma = 0.58$ cm

MT12 $X_{\text{fit}} - X_{\text{hit}}$ $\sigma = 0.70$ cm

MT21 $X_{\text{fit}} - X_{\text{hit}}$ $\sigma = 1.34$ cm

MT22 $X_{\text{fit}} - X_{\text{hit}}$ $\sigma = 1.48$ cm

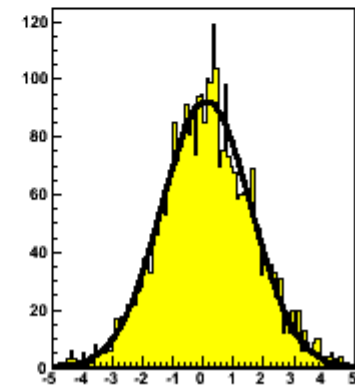

MT11 $Y_{\text{fit}} - Y_{\text{hit}}$ $\sigma = 0.57$ cm

MT12 $Y_{\text{fit}} - Y_{\text{hit}}$ $\sigma = 0.70$ cm

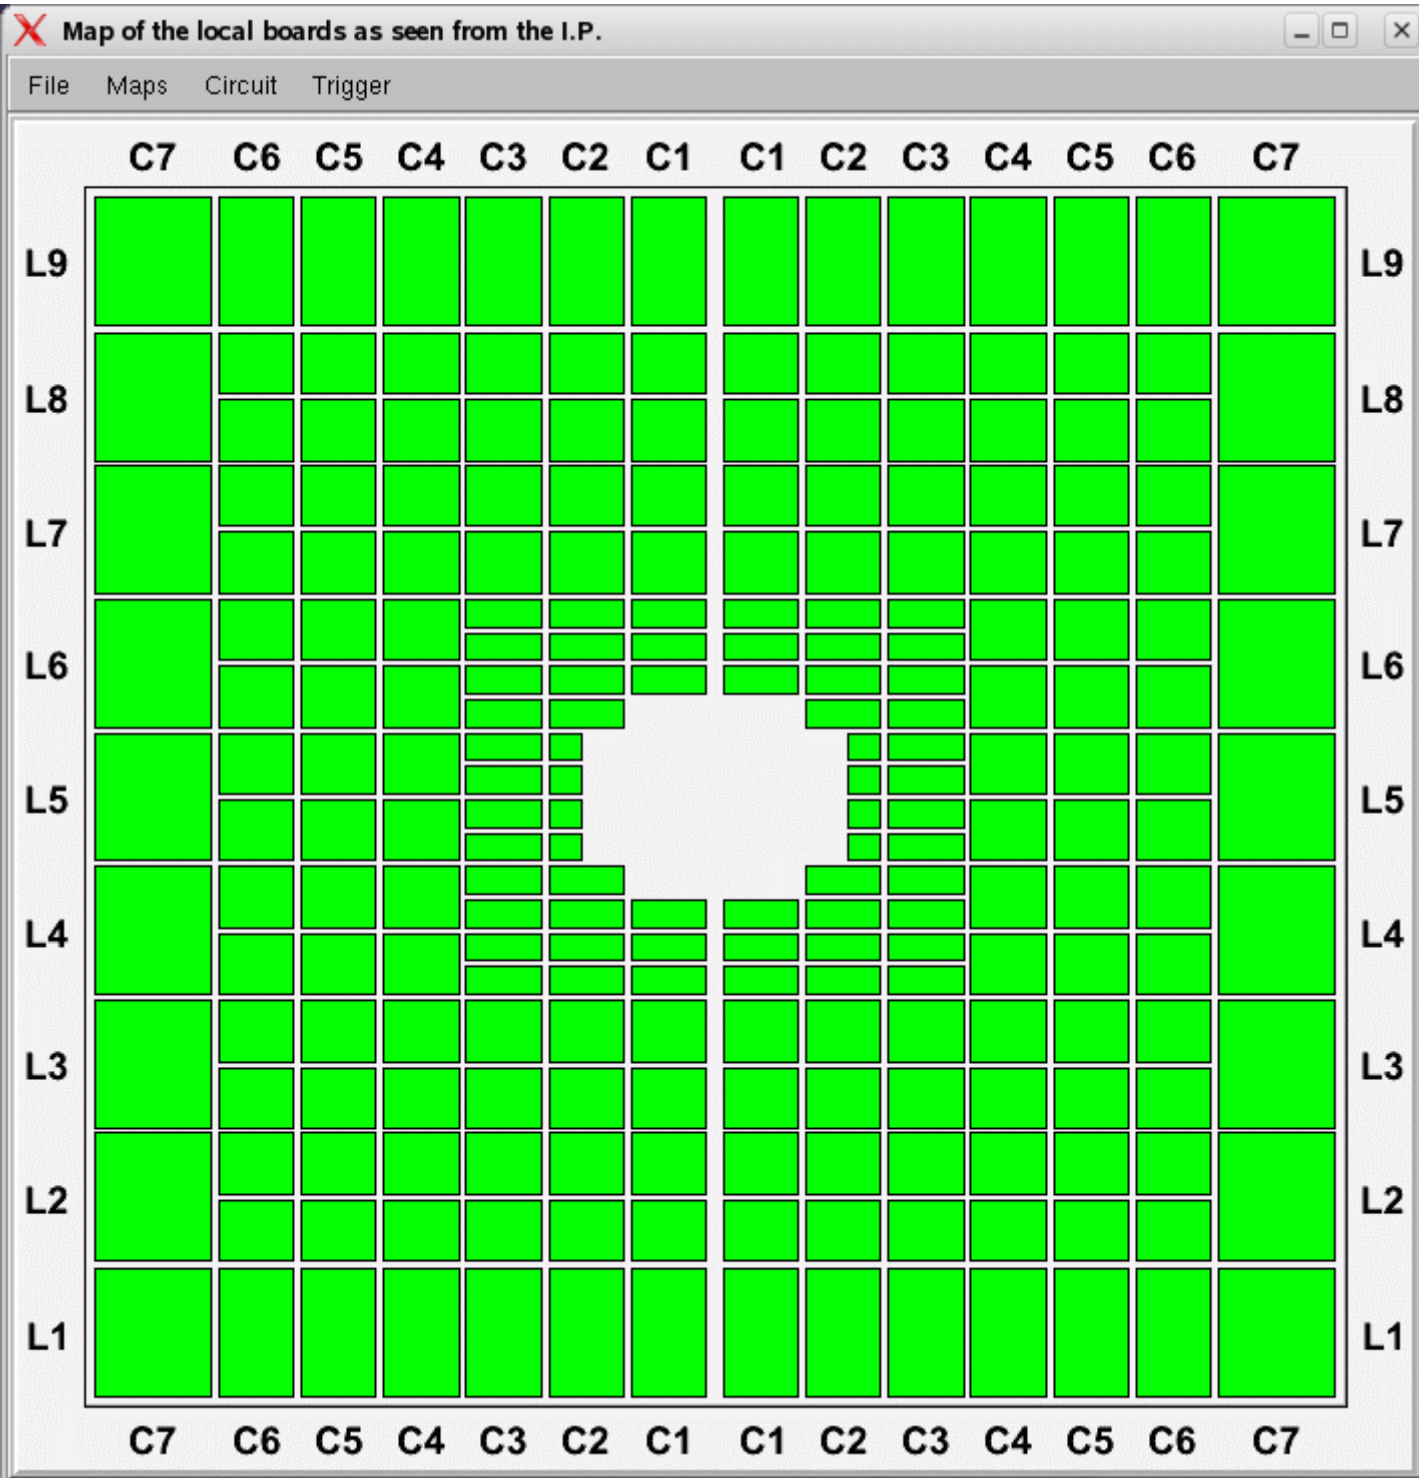

MT21 $Y_{\text{fit}} - Y_{\text{hit}}$ $\sigma = 1.33$ cm

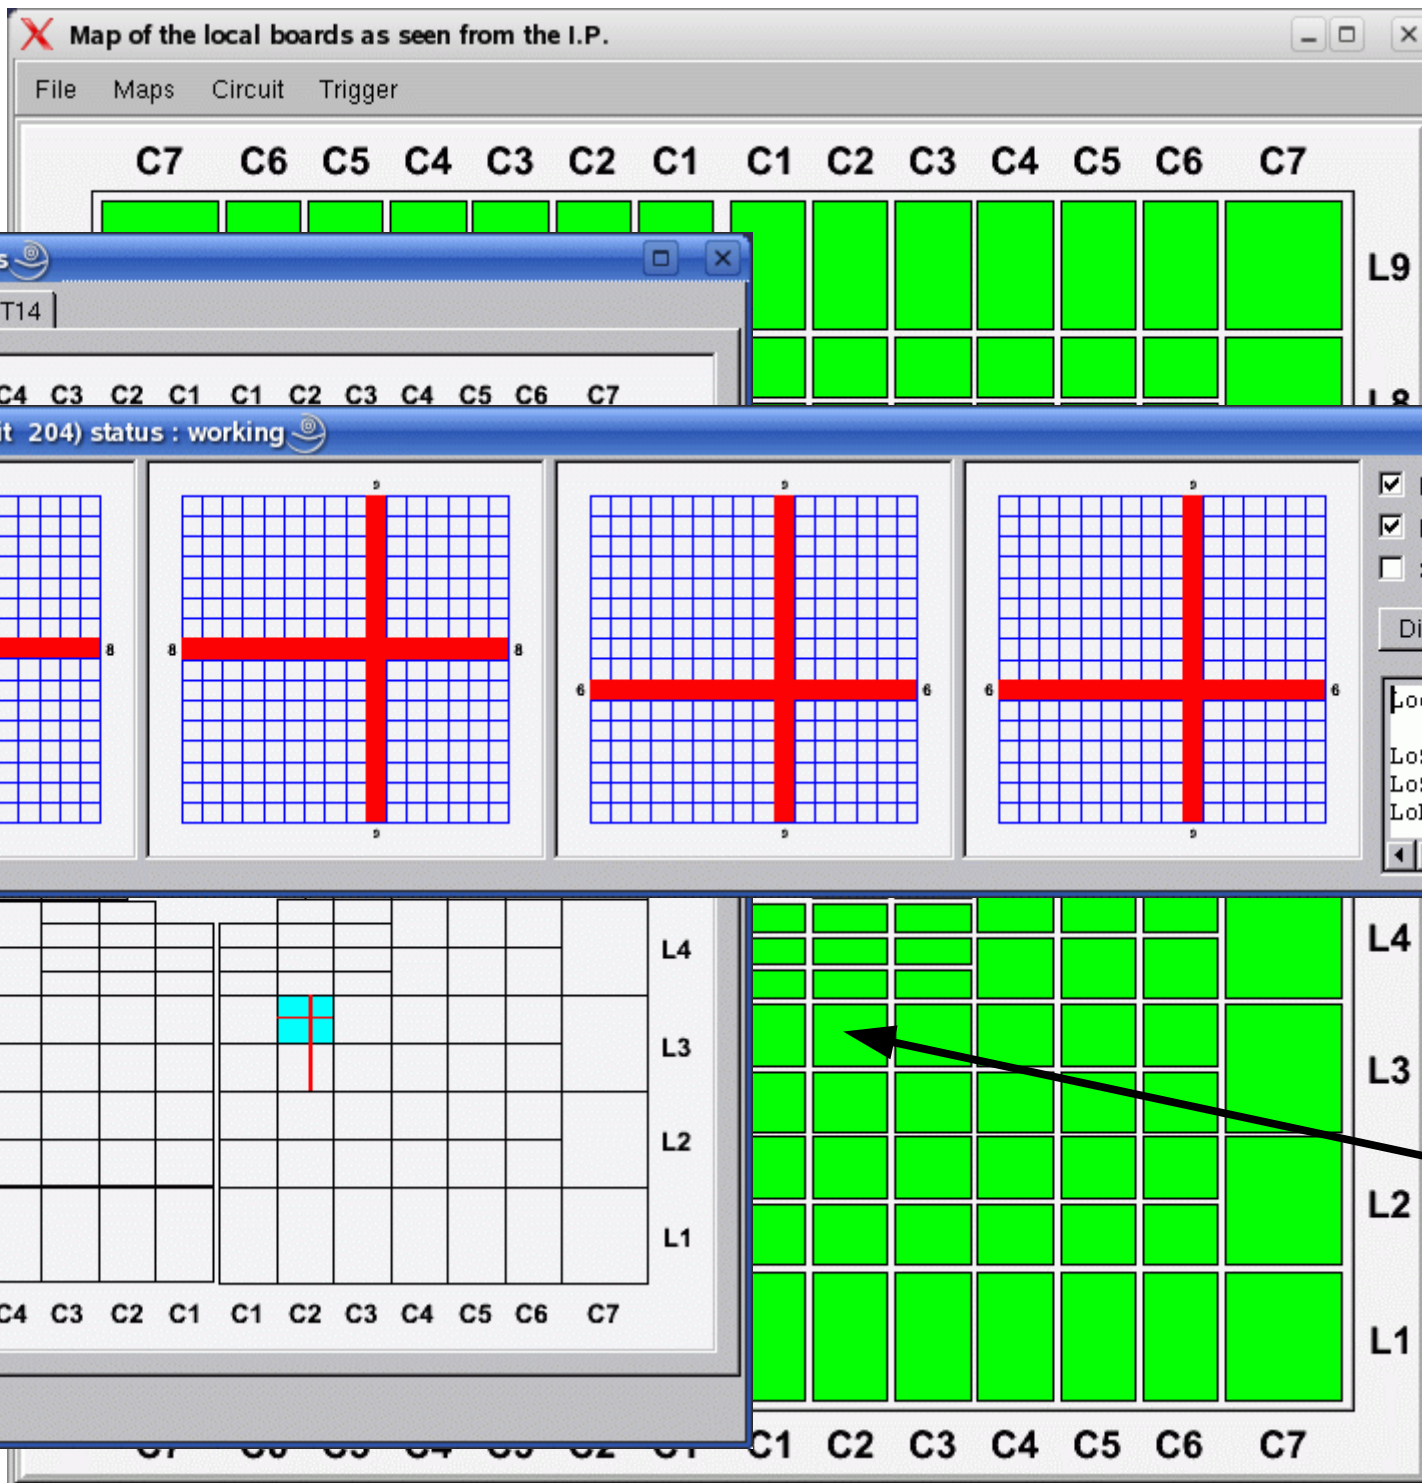

MT22 $Y_{\text{fit}} - Y_{\text{hit}}$ $\sigma = 1.47$ cm

The trigger information in the
representation of the
offline trigger display and debugging tool:

AliMUONTriggerGUI

Hit board

First results

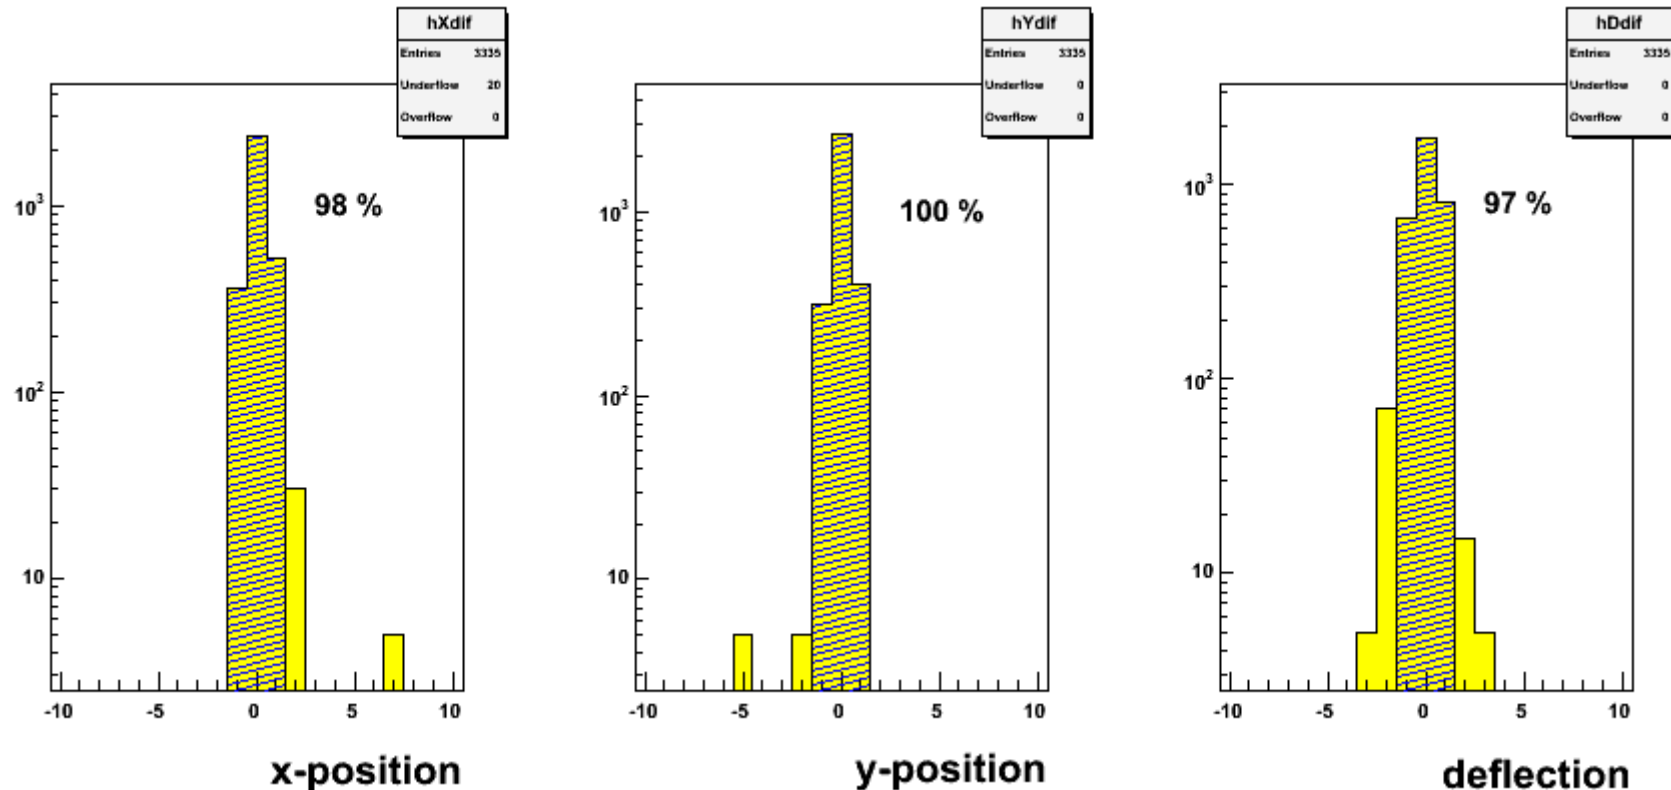

Single 20 GeV/c muon per event, 5000 events

Condition: track with points in all 4 chambers of the last two tracking stations

Differences between the “fast” and “slow” trigger responses

fast - reconstructed track prolongation to the trigger chambers

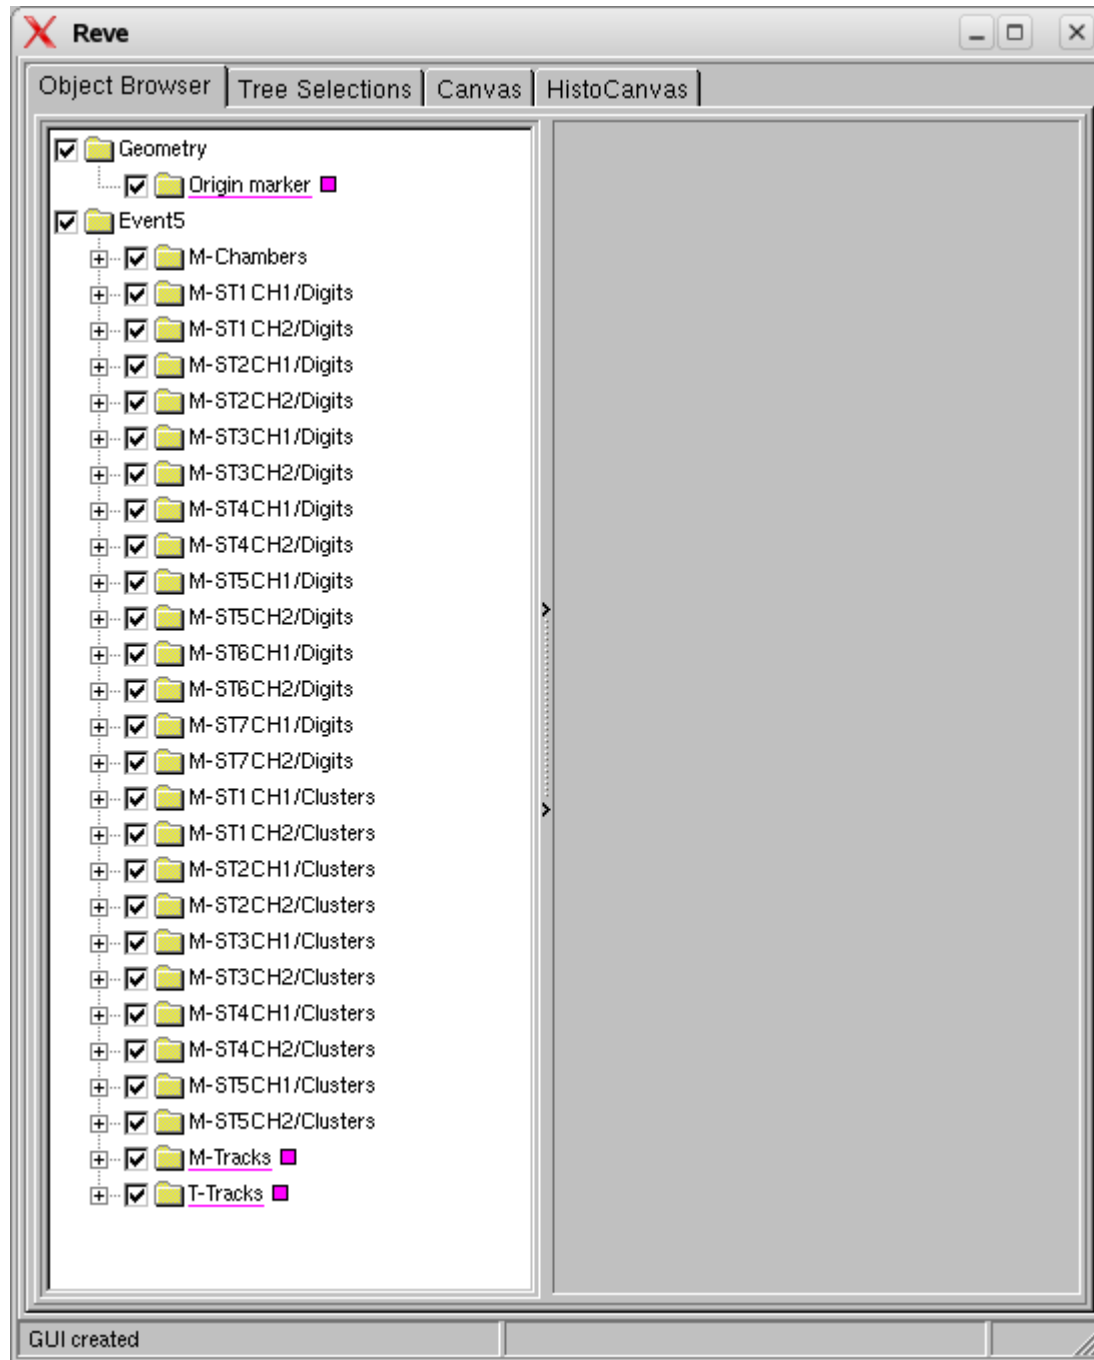

slow - trigger information stored in the raw data

Simulation-data visualisation within the AliRoot event display EVE

Simulation objects in the event display

AliRoot HEAD 25 Sep 2006

.raw raw-data

- clusters
- tracks

.root raw-data

- space problems at creation of raw-data:

/tmp/mdc1
/tmp/mdc2

ToDo

Tests with high momentum single muon OK !

PDC06 muon results:

- track selection
- momentum dependence
- higher track multiplicity

Event display:

- first tests with AliRoot objects converted from the raw-data
(under investigation)
- direct access to the raw-data
