

Enabling Grids for E-science

Operating the EGEE Grid

Presented by Mike Mineter

www.eu-egee.org

A selection of slides from a talk by the EGEE Operations Manager, Ian Bird to the EGEE Conference in Geneva.

<http://indico.cern.ch/materialDisplay.py?contribId=262&sessionId=12&materialId=slides&confId=1504>

Included in this event as an overview of the Operations activity.

The EGEE Production Grid

A Bird's-Eye View

Ian Bird
EGEE Operations Manager

EGEE'06

Geneva, 27th September 2006

- **What is the EGEE grid infrastructure today?**
 - What has been achieved?
 - How does it compare and relate to other production grids?

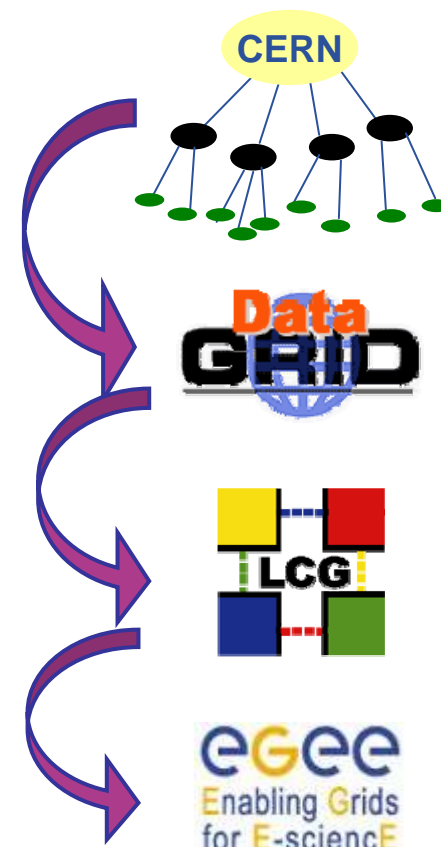

- **What is the outlook in the short term?**
 - Timescale of EGEE-II ...
 - What are the outstanding issues?

- **What should happen next?**

© 2006 Europa Technologies

 Image © 2006 TerraMetrics

- **1999 – Monarc Project**
 - Early discussions on how to organise distributed computing for LHC
- **2000 – growing interest in grid technology**
 - HEP community was the driver in launching the DataGrid project
- **2001-2004 - EU DataGrid project**
 - middleware & testbed for an operational grid
- **2002-2005 – LHC Computing Grid – LCG**
 - deploying the results of DataGrid to provide a production facility for LHC experiments
- **2004-2006 – EU EGEE project phase 1**
 - starts from the LCG grid
 - shared production infrastructure
 - expanding to other communities and sciences
- **2006-2008 – EU EGEE-II**
 - Building on phase 1
 - Expanding applications and communities ...
- **... and in the future – Worldwide grid infrastructure??**
 - Interoperating and co-operating infrastructures?

- **EGEE grew out of the EDG and LCG projects**
 - LCG built the first production middleware distributions and set up the initial grid infrastructure → became EGEE in 2004
 - HEP (and LHC in particular) are very strong drivers for EGEE
 - Branding is changing slowly (gLite-3.0)
- **Difficult to get the right balance:**
 - LCG is pushing the boundaries
 - Data sizes and rates
 - Workloads 50k jobs/day now; ~500k jobs/day in 1 year
 - MoU for service reliability/availability is first real SLA
 - Crucial that other applications push as hard
 - Biomedical – application security aspects
 - And others with their own requirements ...
 - Data challenges are a good way to move forward: LCG, Wisdom
- **Is the balance right?**
 - Everyone complains equally ...

Test-beds & Services

Certification testbeds (SA3)

Pre-production service

Production service

Infrastructure:

- Physical test-beds & services
- Support organisations & procedures
- Policy groups

Support Structures

Operations Coordination Centre

Regional Operations Centres

Global Grid User Support

EGEE Network Operations Centre (SA2)

Operational Security Coordination Team

Security & Policy Groups

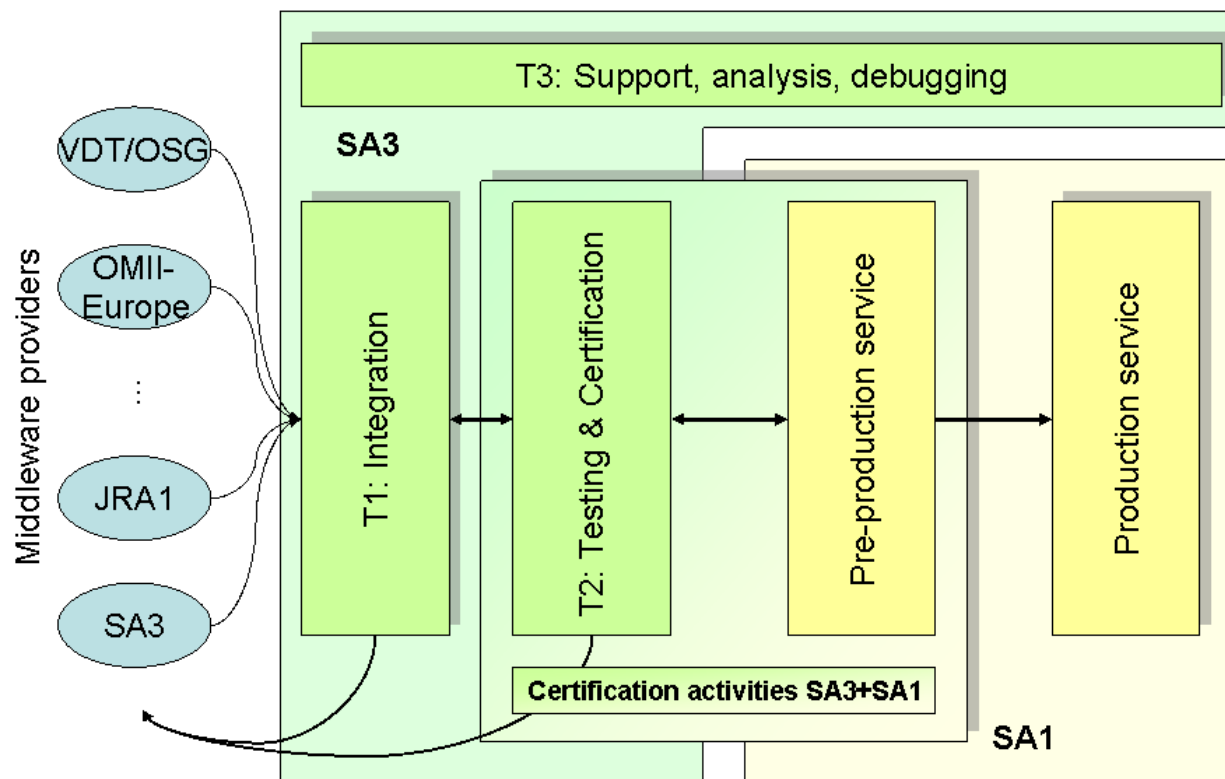

Joint Security Policy Group

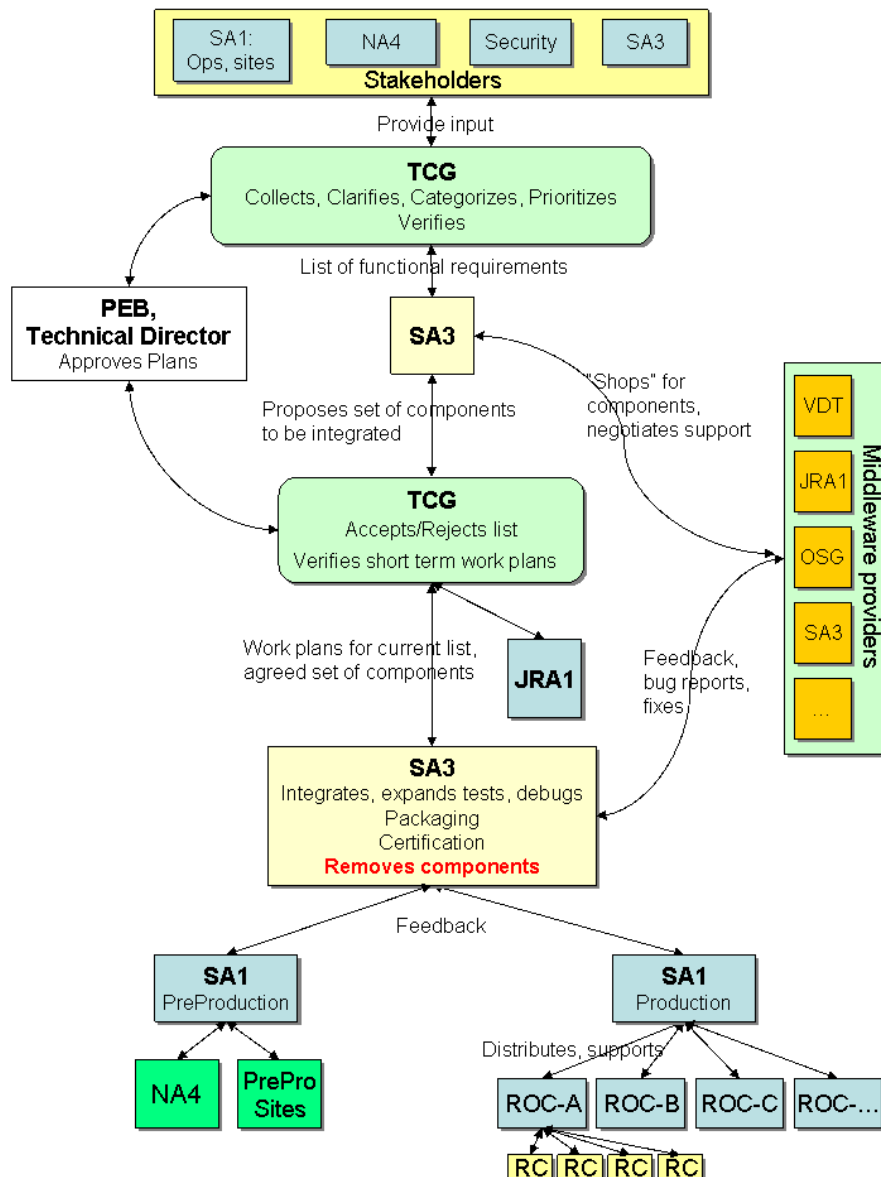

EuGridPMA (& IGTF)

Grid Security Vulnerability Group

Operations Advisory Group (+NA4)

- The goal is to produce a *middleware distribution* that can be deployed widely
 - Not the same as middleware releases from development projects
 - More like a Linux distribution – bringing together many pieces from several sources

- **Technical Coordination Group**
 - Agrees the contents and priorities for what goes into the integration and testing process

- **Not all desired new components or updates may make the next distribution**
 - Depends on priorities and urgency for other pieces

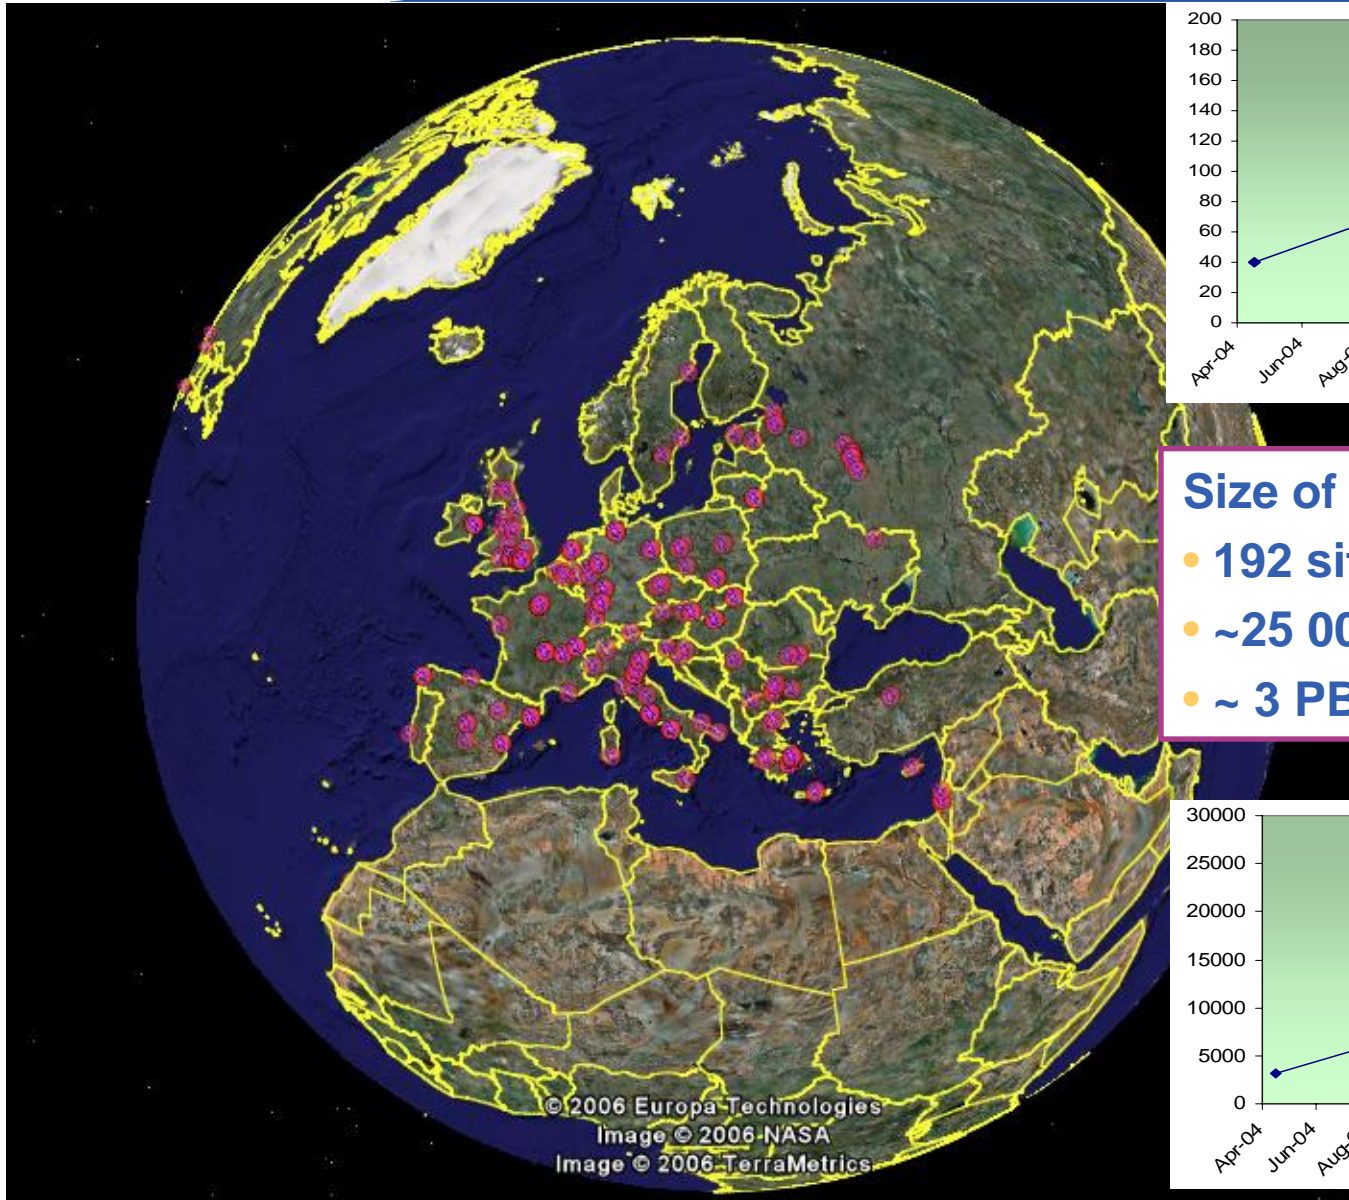

- **Moving away from big-bang releases to component upgrades**
 - Concept of a baseline release and then updates and patches
 - New baseline when significant changes (dependencies, ...)

- **Extensive certification test-bed:**
 - Close to 100 machines involved
 - Main test-bed at CERN, test-beds for specific tasks at SA3 partner sites
- **Emulate the deployment environments**
 - Or at least the main ones ...
- **Certification testing:**
 - Installation and configuration
 - Component (service) functionality
 - System testing (trying to emulate real workloads and stress testing)
 - Beginning to use virtualization to simplify the testing environment
- **Deployment into the pre-production system**
 - Final step of certification – validation by real sites
 - Validation by applications – also allows to prepare apps for new versions

- **Once a distribution is ready for deployment, it takes several months to get this to the majority of sites**
 - Seems to be a constant
 - Advantage of decoupling the components – VOs can encourage sites to update the pieces they require
 - Client tools can be simply installed (remotely) even without site upgrade
- **Deployment onto the EGEE infrastructure is managed and supported by the Regional Operations Centres**

- **Pre-production service is now ~ 20 sites**
- **Provides access to some 500 CPU**
 - Some sites allow access to their full production batch systems for scale tests
- **Sites install and test different configurations and sets of services**
 - Try to get good feeling for the quality of the release or updates before general release to production
 - Feedback to: certification, integration, developers, etc.

Size of the infrastructure today:

- 192 sites in 40 countries
- ~25 000 CPU
- ~ 3 PB disk, + tape MSS

<i>Region</i>	<i>#countries</i>	<i>#sites</i>	<i>#cpu</i>	<i>#cpu DoW</i>	<i>disk (TB)</i>
<i>CERN</i>	0	1	4400	1800	770*
<i>UK/I</i>	2	23	4306	2010	310
<i>Italy</i>	1	27	2800	2280	373
<i>France</i>	1	10	2316	1252	300*
<i>De/CH</i>	2	13	2895	1852	280*
<i>Northern Europe</i>	6	16	2379	1860	64
<i>SW Europe</i>	2	13	956	898	16*
<i>SE Europe</i>	8	26	1101	1189	30
<i>Central Europe</i>	7	21	1584	1163	70
<i>Russia</i>	1	15	515	445	38
<i>Asia-Pacific</i>	8	19	840	751	72
<i>North America</i>	2	8	4069	-	229
Totals	40	192	28161	20265	2552

* Estimates taken from reporting as IS publishes total MSS space

Usage of the infrastructure

Workloads of the “other VOs” start to be significant – approaching 8-10K jobs per day; and 1000 cpu-months/month

- one year ago this was the overall scale of work for *all* VOs

20k jobs running simultaneously

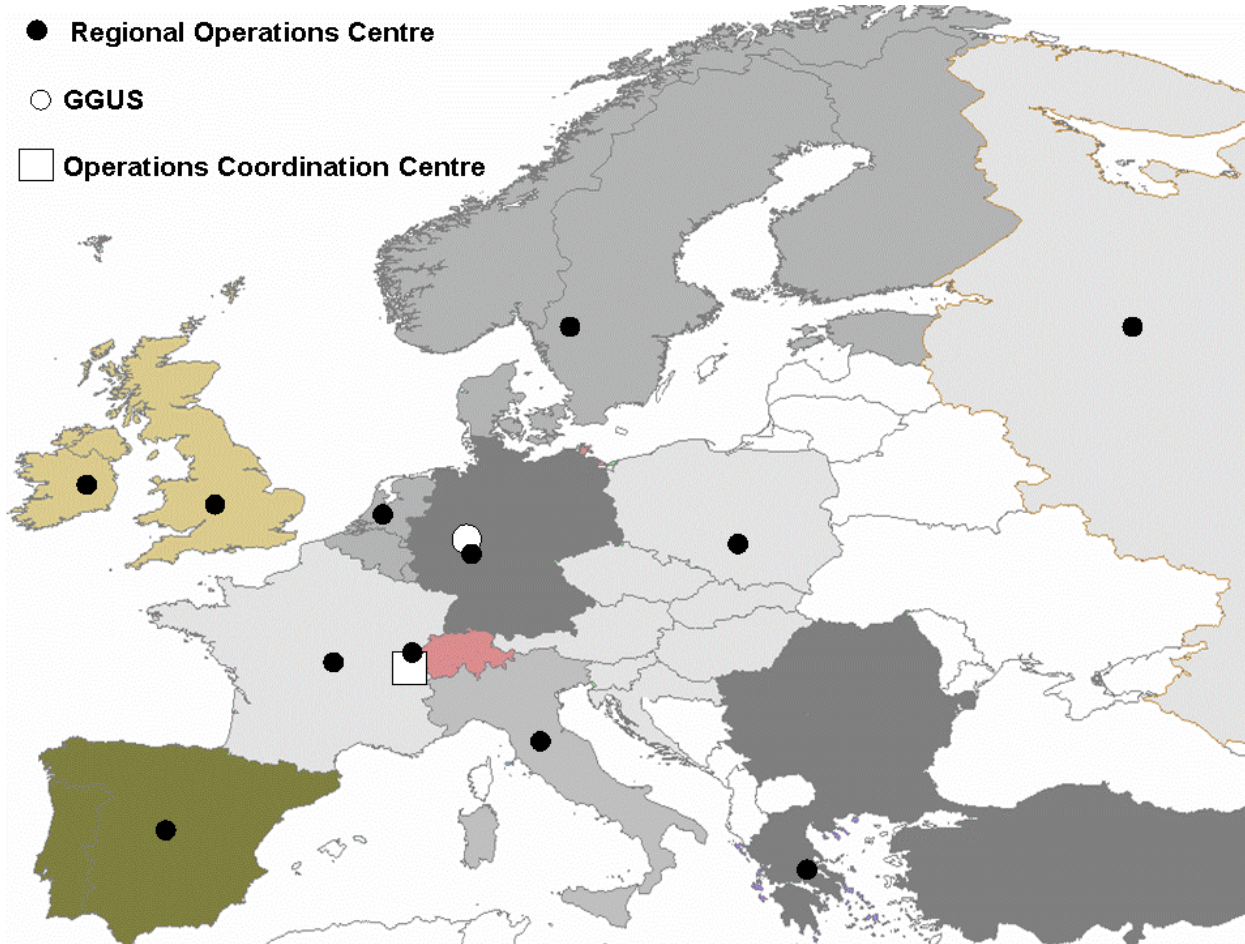

Use for massive data transfer

Large LHC experiments now transferring ~ 1PB/month each

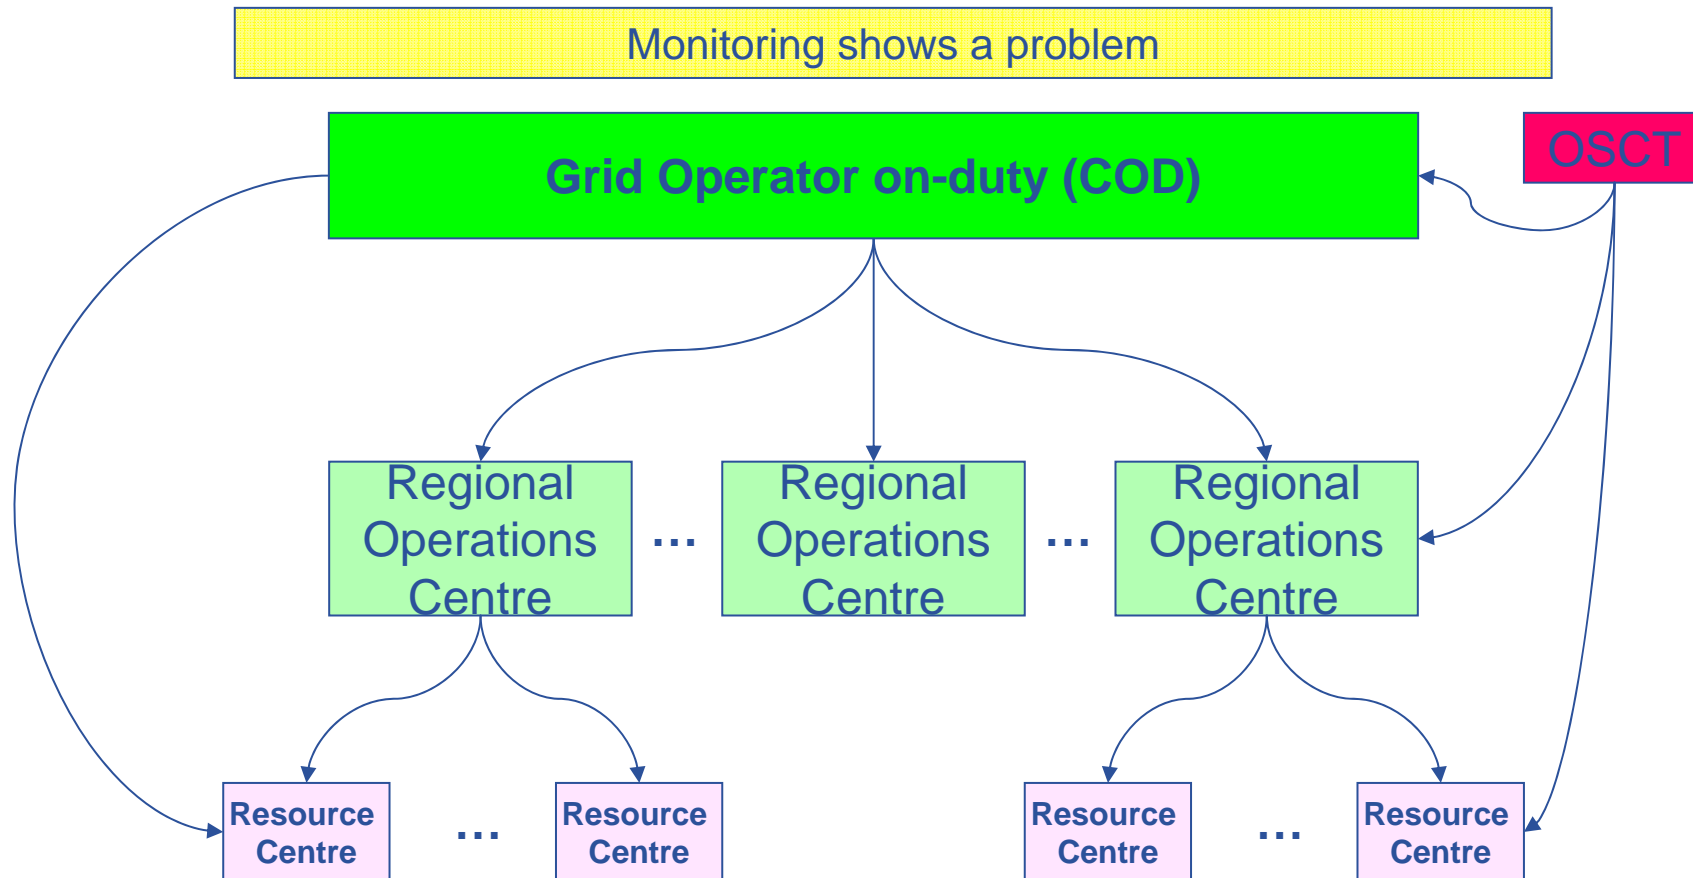

- Regional Operations Centre
- GGUS
- Operations Coordination Centre

- **Operations Coordination Centre (OCC)**
 - management, oversight of all operational and support activities
- **Regional Operations Centres (ROC)**
 - providing the core of the support infrastructure, each supporting a number of resource centres within its region
 - **Grid Operator on Duty**
- **Resource centres**
 - providing resources (computing, storage, network, etc.);
- **Grid User Support (GGUS)**
 - At FZK, coordination and management of user support, single point of contact for users

The goal is to proactively **monitor** the operational state of the Grid and its performance, **initiating corrective action to remedy problems** arising with either core infrastructure or Grid resources

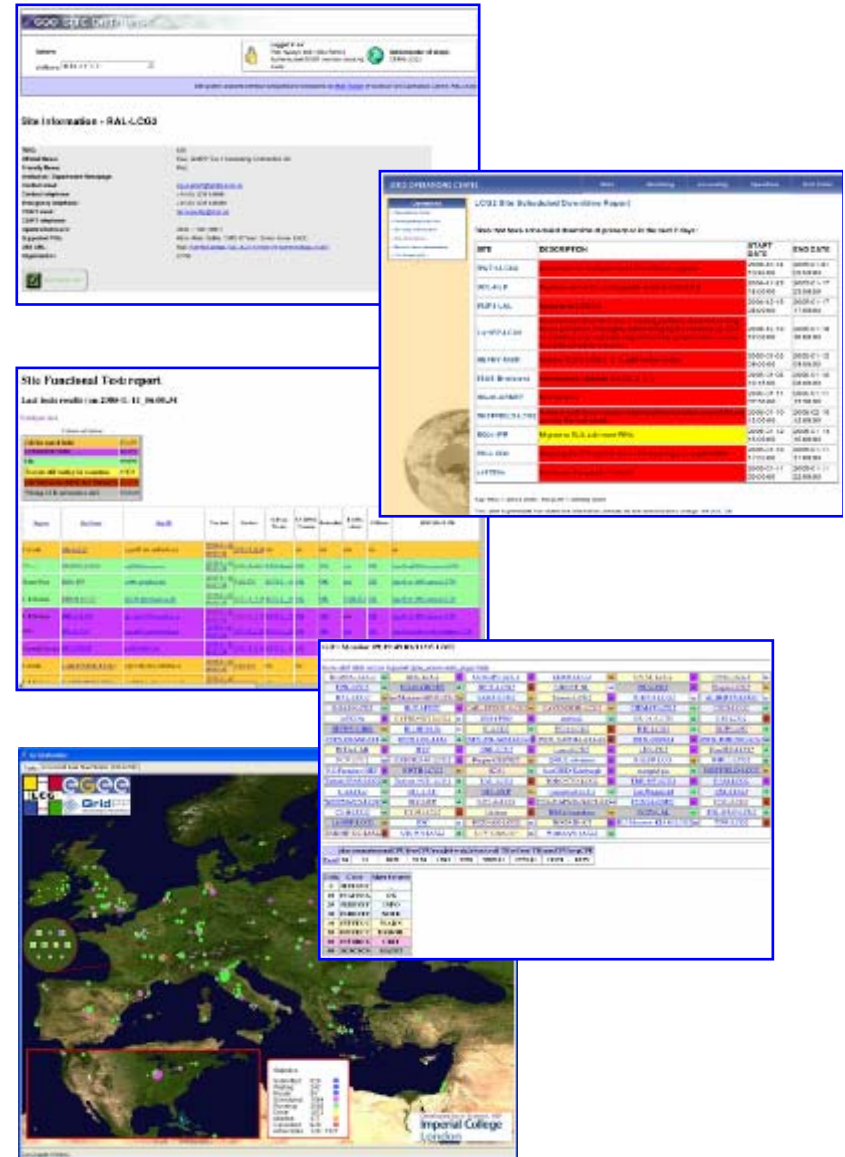

- **Role:**

- Watch the problems detected by the grid monitoring tools
- Problem diagnosis
- Report these problems (GGUS tickets)
- Follow and escalate them if needed (well defined procedure)
- Provide help, propose solutions
- Build and maintain a central knowledge database (WIKI)

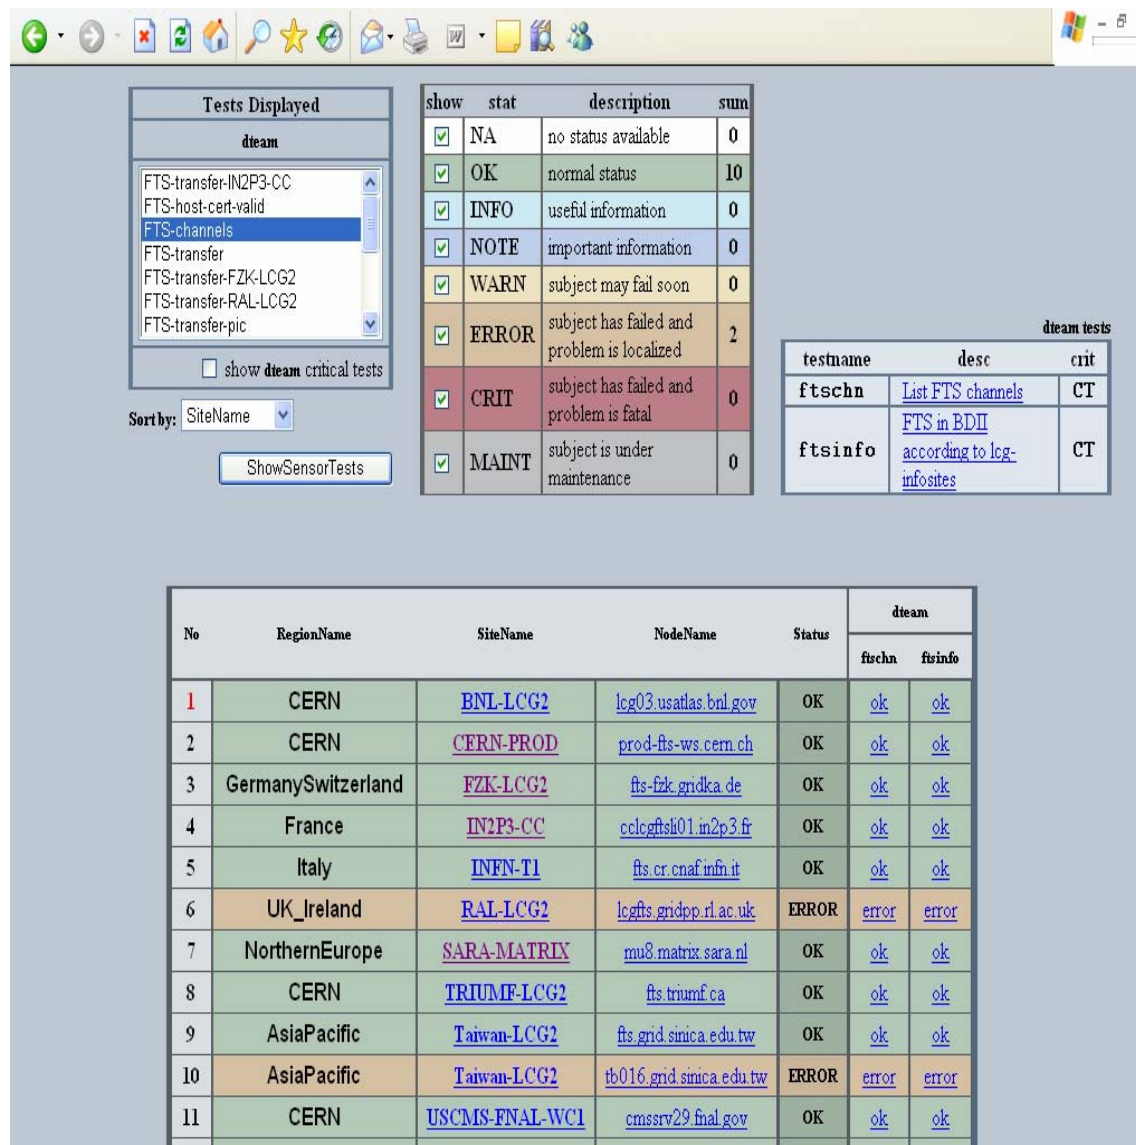

- **Who?**

- 9 ROC teams working in pairs (one lead and one backup) on a weekly rotation
- CERN, France, Italy, UK, Russia, Asia-Pacific, Southeastern-Europe, Central-Europe, Germany-Switzerland

- Tools used by the Grid Operator on Duty team to detect problems
- **Distributed responsibility**
- **CIC portal**
 - single entry point
 - Integrated view of monitoring tools
- **Site Functional Tests (SFT) -> Service Availability Monitoring (SAM)**
- **Grid Operations Centre Core Database (GOCDB)**
- **GIS monitor (Gstat)**
- **GOC certificate lifetime**
- **GOC job monitor**
- **Others**

- **Service Availability Monitoring (SAM)**
 - Monitoring of all grid services
 - web service based access to data
 - availability metric calculation
 - Will be used to generate alarms
 - to generate trouble tickets
 - to call out support staff

Overall Service Availability for site CERNPR : Daily Report

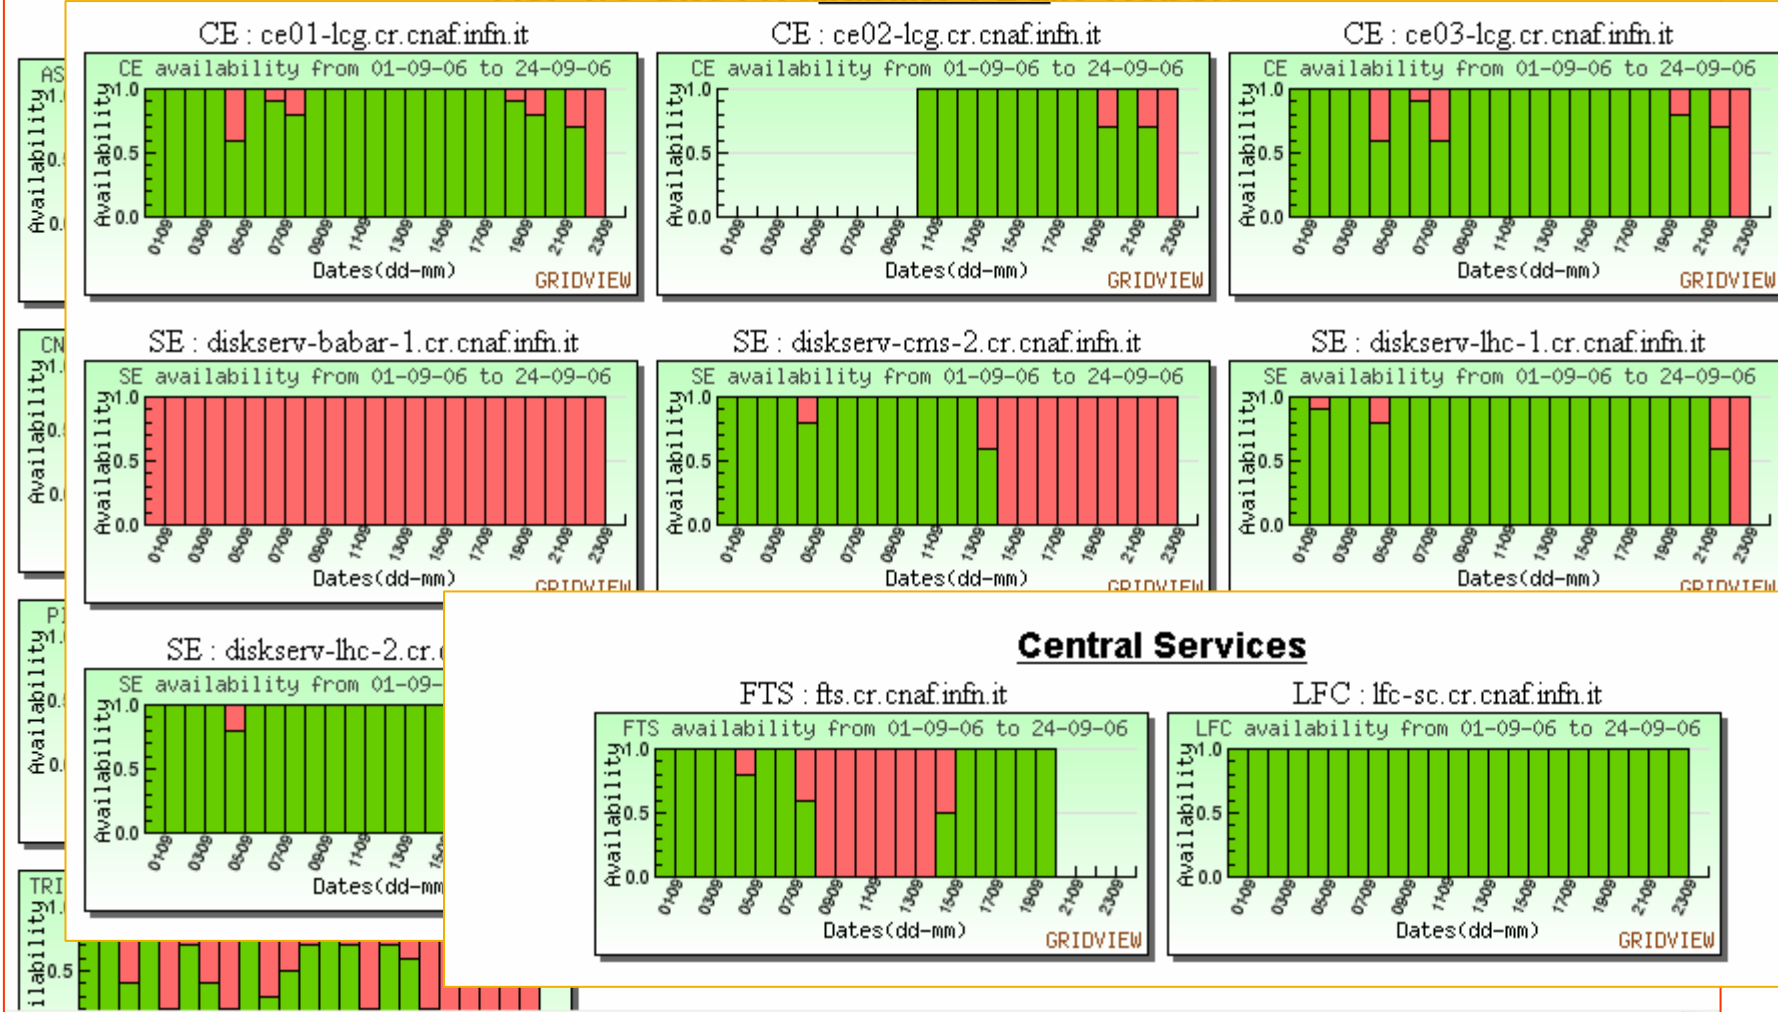

Individual Service Availability for site CERNPR : Daily Report

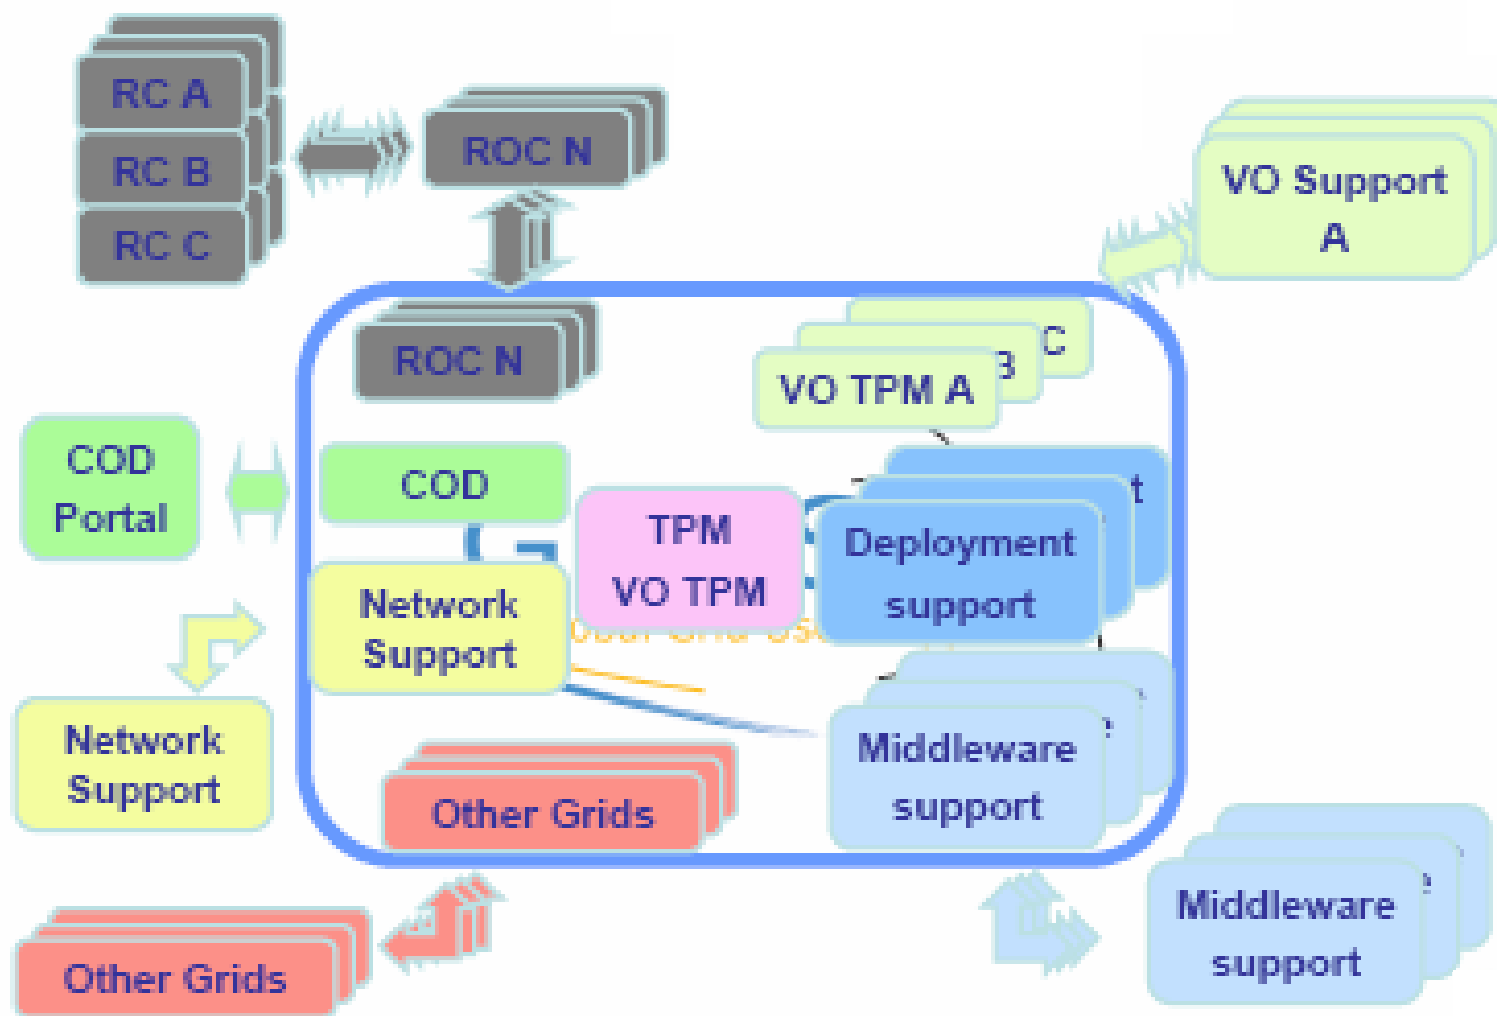

Service Instance Availability for site CERNPR : Daily Report

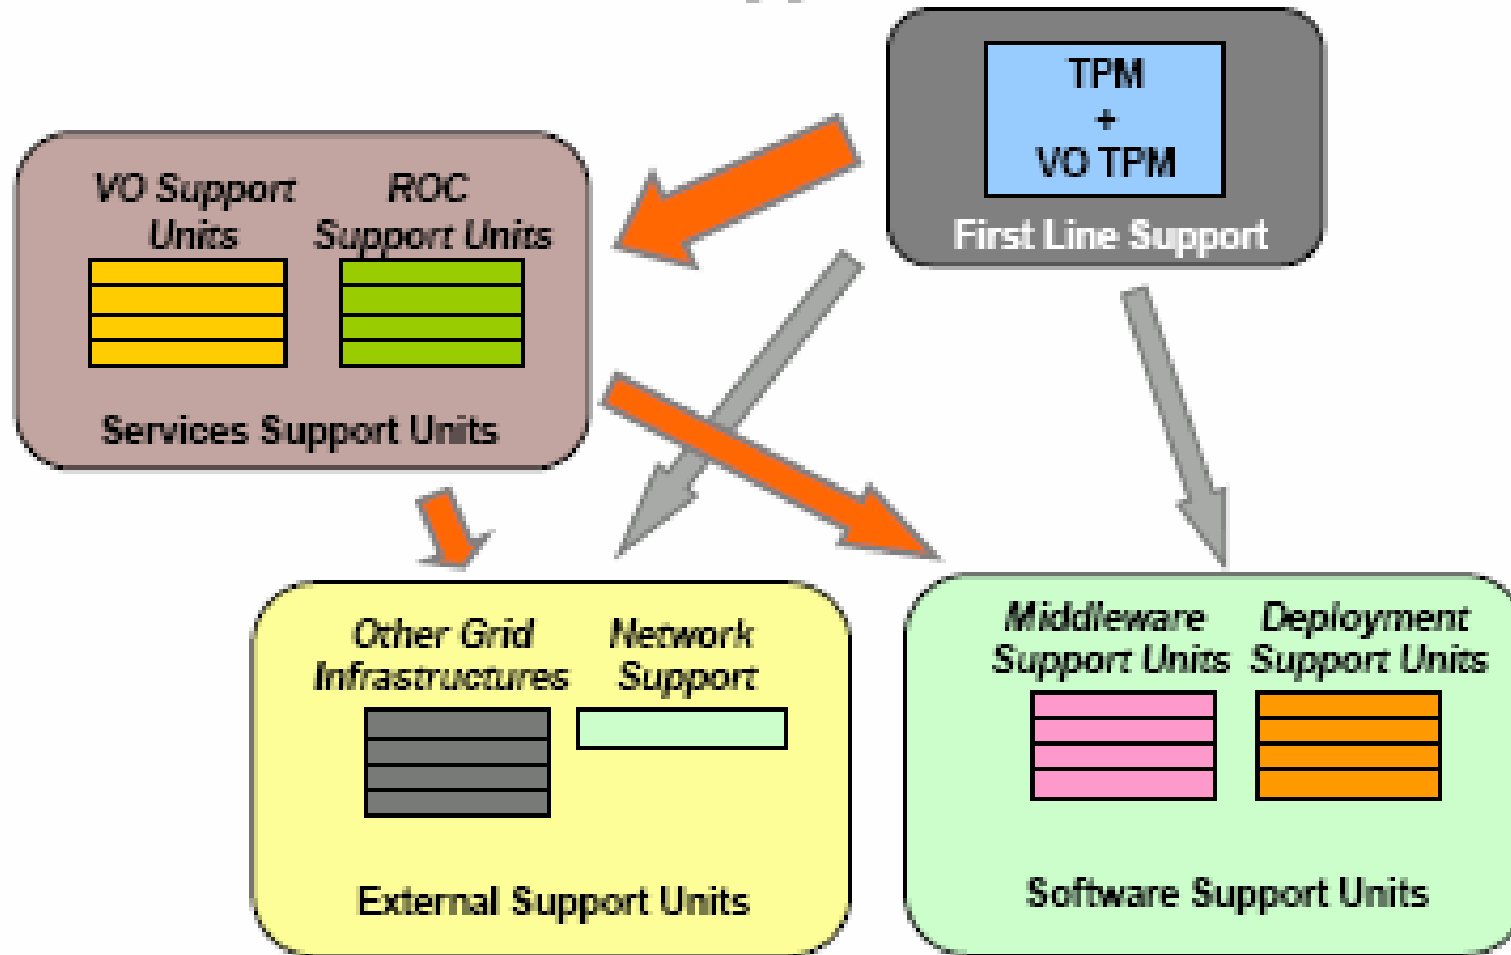

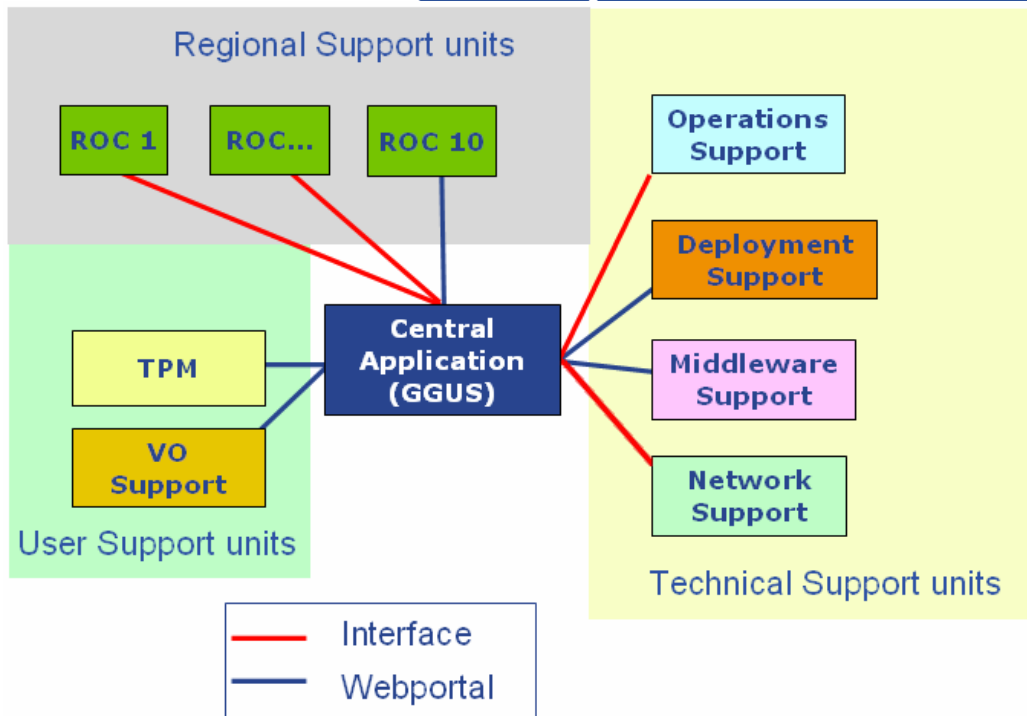

Tier-1/0 Site Availability : Daily Report

Support Workflow

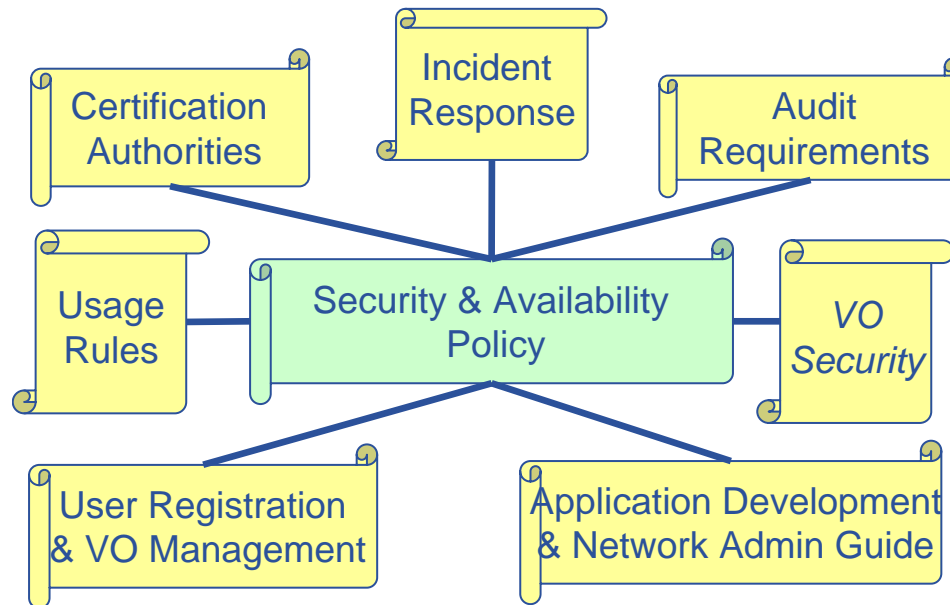

- Creating a “Network Support unit” in the EGEE operational model;
- Based on the work done during EGEE:
- First implementation in EGEE-II:
 - First “iteration”;
 - Planned developments in the next months.

- **Tasks:**

- Receive tickets from NRENs, and forward to GGUS if impact on grid
- Receive tickets from GGUS if TPM determines a network issue
- Troubleshoot them provided that the ENOC has access to suitable monitoring tools;
- Contact identified faulty domains or reassign ticket to the associated site if there is no evidence of a backbone problem (e.g. LAN issue).

- **Interface with NRENs is running like in EGEE:**
 - ENOC receives Trouble Tickets (incident, maintenance) from GÉANT and the NRENs (currently France, Germany, Greece, Hungary, Ireland, Italy, Russia, Spain, Switzerland, and United Kingdom);
 - More to come: Poland, the Netherlands, Czech Republic;
 - Forward it to GGUS after analysis and if relevant to EGEE.
- **Identified as the Network Support unit in GGUS:**
 - 2nd level support for network related issues
- **Identified as the point of contact for EGEE by the NRENs and GEANT2**

Collaborative policy development

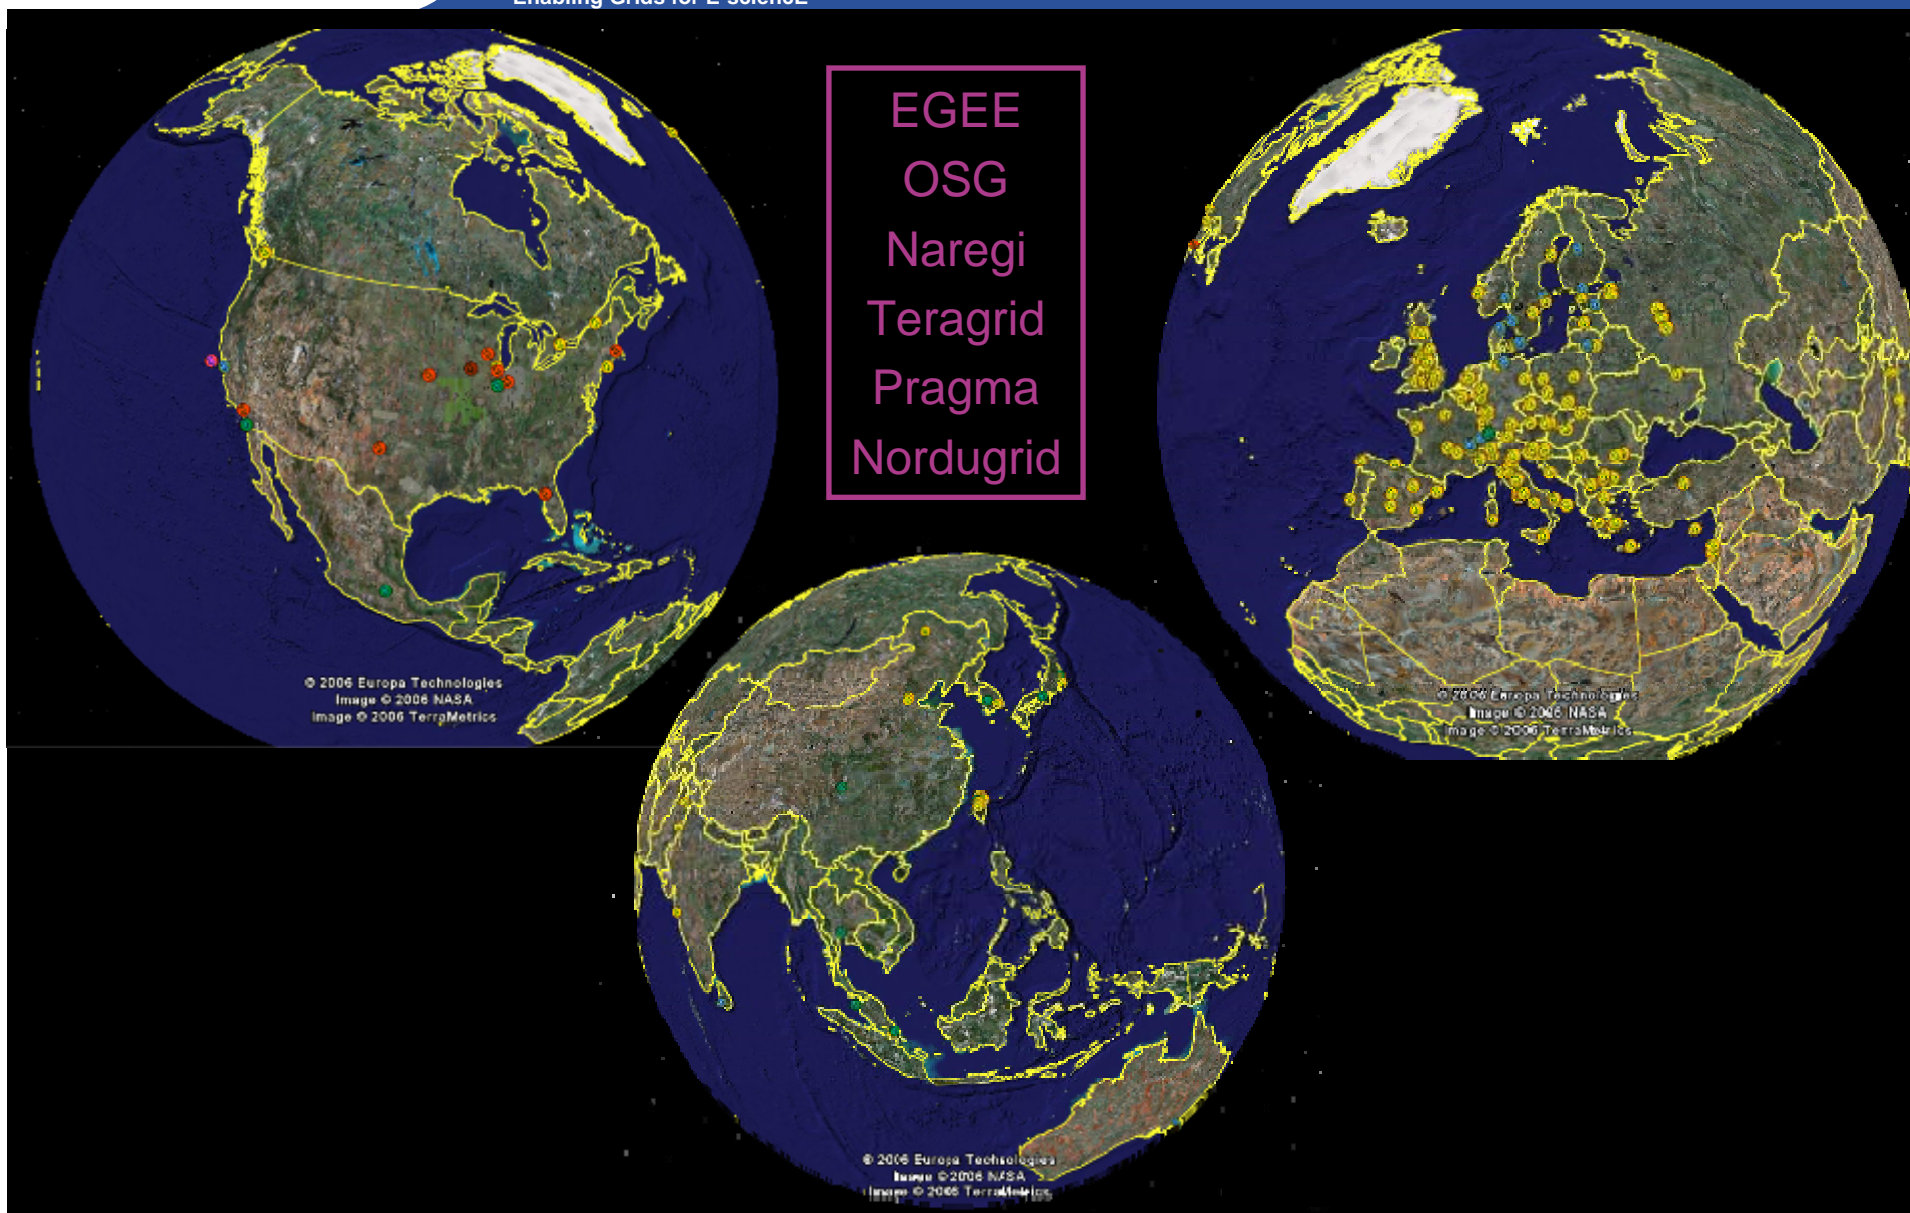

- Many policy aspects are collaborative works; e.g.:
- **Joint Security Policy Group**
- **Certification Authorities**
 - EUGridPMA → IGTF, etc.
- **Grid Acceptable Use Policy (AUP)**
 - common, general and simple AUP
 - for all VO members using many Grid infrastructures
 - EGEE, OSG, SEE-GRID, DEISA, national Grids...
- **Incident Handling and Response**
 - defines basic communications paths
 - defines requirements (MUSTs) for IR
 - not to replace or interfere with local response plans

- **Joint Security Policy Group:**
 - Joint with WLCG, OSG, and others
 - Focus on policy issues
 - Strong input to e-IRG
- **EUGridPMA**
 - Pan-European trust federation of CAs
 - Included in IGTF (and was model for it)
 - Success: most grid projects now subscribe to the IGTF
- **Grid Security Vulnerability Group**
 - New group in EGEE-II
 - Looking at how to manage vulnerabilities
 - Risk analysis is fundamental
 - Hard to balance between openness and giving away insider info
- **Operational Security Coordination Team**
 - Main day-to-day operational security work
 - Incident response and follow up
 - Members in all ROCs and sites
 - Recent security incident (**not** grid-related) was good shakedown

- **Role**
 - Negotiate access to resources for applications and VOs
 - Manage procedures:
 - To recognize new VOs & define MoUs
 - Identify and manage major procedural problems between VOs and Operations
- **Membership**
 - Co-chaired by SA1 and NA4
 - Members: VO Managers, ROC managers
- **Status**
 - New simpler VO registration procedure in place
 - MoU with DILIGENT in progress
 - Tools to show high level resource allocation by region and VO are planned
- **Issues**
 - Resource negotiation procedures have to be developed
 - This has to be done by region
 - Resource allocation summary tools are a pre-requisite
 - Escalation procedures in case of unsatisfied requests have to be found
 - The operation of the OAG itself has to be changed
 - No EGAAP any longer
 - User Forum and EGEE Conference now more important for face-to-face meetings

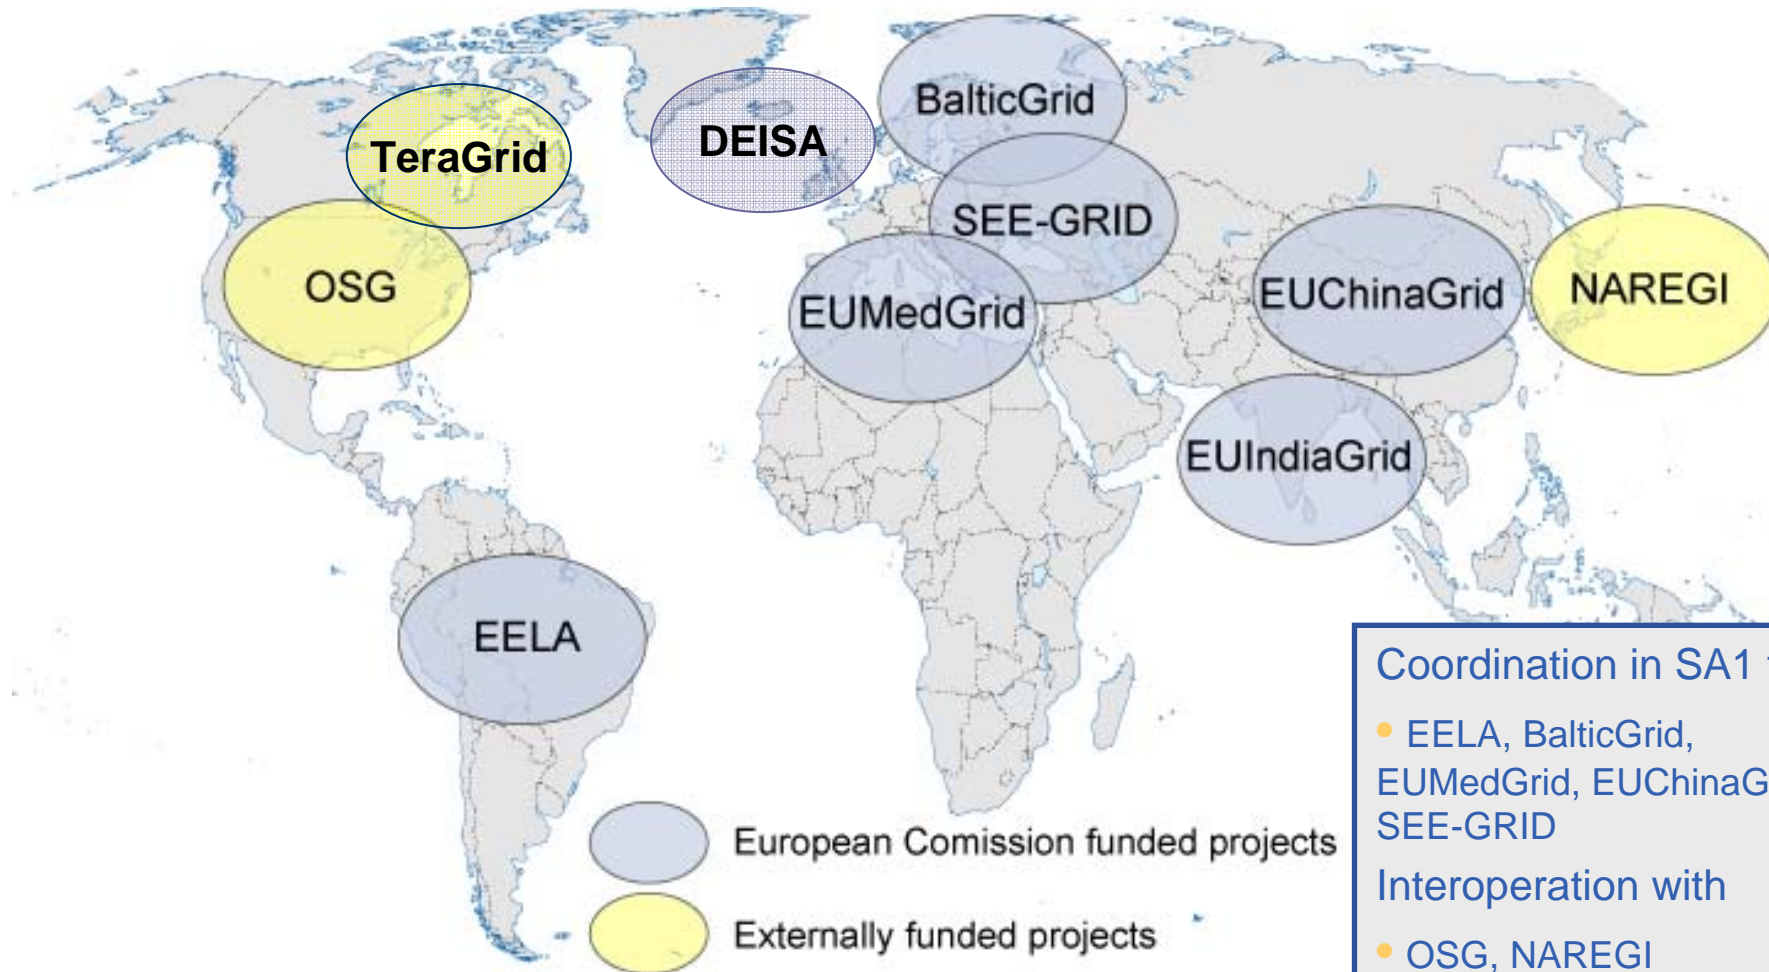

- **Interoperability and interoperation (or co-operation)**
- **EGEE has interoperability activities with:**
(enabling the middlewares to work together)
 - Open Science Grid (U.S.) – quite far advanced
 - Nordugrid (ARC) – task in EGEE-II, 4 workshops and ongoing activity
 - UNICORE – task in EGEE-II
 - NAREGI (Japan) – 1 workshop, continued activity
 - GIN (OGF) – active in several areas
- **EGEE has interoperation activities with:**
(enabling the infrastructures to co-operate)
 - Open Science Grid – actually in use
 - Anticipated with NorduGrid (NDGF) for WLCG

- To obtain a Google map of the Grids in the Globus Interoperability Now (GIN) initiative go to:

<http://www.pparc.ac.uk/Nw/GIN.asp>

- (You will need to install GoogleEarth)

Coordination in SA1 for:

- EELA, BalticGrid, EUMedGrid, EUChinaGrid, SEE-GRID

Interoperation with

- OSG, NAREGI

SA3:

- DEISA, ARC, NAREGI

- **Today we have an operating production infrastructure**
 - Probably the largest in the world, supporting many science domains
 - Relied upon by several as their primary source of computing
- **We have a managed operations process addressing most areas**
 - Constantly evolving
- **Inter/Co-operation is a fact and is becoming more important very quickly**
 - Several applications need to work across grids – and they need support for that
- **A large fraction of the value of the operations activity is in the intangibles – processes, structures, expertise, etc.**
- **We recognise that there are many outstanding problems with the current state of things**

Some (personal) observations

- **Production grids turned out to be a lot harder than anticipated**
 - Often not production quality software, not designed with services and service management in mind – really should regard as advanced prototypes
 - Rediscovered the wheel : takes a long time to go from prototypes to production quality
 - We have done a lot : but it is hard to use, hard to support, and hard to manage ...
- **Complexity**
 - We have a lot of complexity – often a clue that something is not right
 - Perhaps it is necessary ... ? But we should be careful.
- **Many of the reliability issues are not grid specific**
 - Site management problems are reflected in the overall service
- **... and any major changes we make have to be implemented in such a way that does not break the production service**

- **Urgently need to support more platforms**
 - Migration to GT4 (pre-WS)
 - Simplify effort involved in porting
- **Deployment of new services**
 - Especially secure data management
 - Better support for MPI
 - ...
- **Site reliability, stability – Understanding of the system in detail**
 - Not more monitoring tools
 - We need more sensors (do we monitor enough or the right things?)
 - We need data interpretation (knowledge not information)
 - And use that to generate actions – alarms, self-repairing systems, ...
 - We have to manage a dynamically changing distributed system with many levels of reliability, management, stability
 - And hide this from the applications !
- **How do we scale up to 10-50 times the workload we have now?**

- **Reliability & management must be built in not added on**
 - We have been through 1 round of “re-engineering” – now we need the “real thing”
- **We need a real architecture (avoid “VO Boxes”)**
 - How do we deploy application level services in an acceptable way?
- **Information systems:**
 - Crucial to a grid infrastructure, more and more information needs to be published
 - See the limits of current system
 - Our experience and knowledge is encapsulated in GLUE, not the implementation
- **Security model**
 - Proxy renewals ? Is this what we want?
 - Complexity again
 - Where does Shibboleth fit?
 - Is there a better way?
- **Dynamic VOs (the original idea of what a VO could be)**
 - How to achieve this? It seems a long way off
 - cf ITU exercise where we hi-jacked an existing VO

- **Interoperation, interoperability is the best way to drive real standards**
 - But must take care not to constrain ourselves – things are still changing rapidly
- **See already practical work on information systems, data, job submission, etc**
 - Both in EGEE and related projects and in the GGF/OGF GIN work
- **EGEE Operations have a wealth of experience now**
 - Procedures, issues, what works, what does not work
 - The problem is finding the time to publish this knowledge
 - We need to start documenting this now – especially at the ROC level
- **The value of EGEE is in the infrastructure – not just the production service, but all the parts that fit around that**
 - This is more or less independent of any specific set of middleware (although that makes life more or less easy ...)

- **We have come a long way in the last 5-6 years**
 - From specific solutions for HEP to a vision of a global infrastructure
 - But we need to be careful to walk before we run ... and clarify expectations
- **Many complex issues need to be addressed**
- **We should expect to see major changes in implementations**
 - But the infrastructure should remain and evolve across these changes
- **Standardisation will come with co-operating grids**
- **Many opportunities for collaboration**
 - With other projects, with industry, with applications
