Effective theory for Sudakov logarithms in lepton-nucleon interactions

Monday, August 8, 2016 6:30 PM (2 hours)

A new framework for computing electromagnetic radiative corrections to precision measurements involving lepton-nucleon interactions is presented. A class of two-loop corrections to elastic electron-proton scattering is implemented and the status of the proton radius puzzle is reviewed. Related applications to long-baseline neutrino oscillation measurements, muon-electron conversion, and hadronic inputs to muon $g-2$, are discussed.
