Galaxy Clusters in DES: latest results (12' + 3')

Friday 5 August 2016 09:15 (15 minutes)

The Dark Energy Survey (DES) is the largest imaging survey by cosmological volume to date. By observing and studying in detail the properties of tens of thousands of galaxy clusters, the DES clusters effort works towards our goal of measuring cosmological parameters with percent-level precision. We present the latest results from this program and discuss prospects for the upcoming data.
