Search for anisotropy of UHECR with the Telescope Array experiment (12' + 3')

Thursday 4 August 2016 12:10 (15 minutes)

Telescope Array (TA) is a hybrid detector of ultra-high energy cosmic rays (UHECRs) sensitive to cosmic rays with energies from about 10^{16} eV to over 10^{20} eV. The detector, which is operational from May 2008, by now has collected full 8 years of data and accumulated the largest to date UHECR data set in the Northern hemisphere. We will summarize the searches for anisotropy of UHECRs that have been performed in TA.
