Type: **Poster**

## **CCQE Model Differences in 1p1h and 2p2h Interactions**

*Monday, August 8, 2016 6:30 PM (2 hours)*

Modern neutrino interaction models describe the nuclear target more precisely than the simple relativistic Fermi gas model with impulse approximation that has been the standard in neutrino event generators for decades. In this poster, we present the impact of these model differences on the outgoing lepton kinematics that are observable in detectors.
