Charged Higgs boson searches with the ATLAS detector (12' + 3')

Saturday 6 August 2016 09:15 (15 minutes)

Several theories beyond the Standard Model, like the 2HDM, predict the existence of high mass charged Higgs particles. Such charged Higgses, produced in association with a top quark, are searched for in the tau + jets decay channel and in the top-bottom decay channel, using about 10 fb⁻¹ of p-p collisions at 13 TeV.

Presenter: GWILLIAM, Carl Bryan (University of Liverpool (GB))

Session Classification: Higgs Physics

Track Classification: Higgs Physics
