

Production asymmetries of b and c hadrons at LHCb

The production rates of b and c -hadrons in pp collisions are not expected to be identical to those of \bar{b} and \bar{c} -hadrons due to the fact that there can be coalescence between a heavy quark produced in the hard scattering and u and d valence quarks in the remnant of colliding protons. In this talk we present the latest LHCb measurements on production asymmetries of b and c -hadrons.
