  - Results
- 6 Conclusion and Future Work

# The Drell-Yan process

## MASSIVE LEPTON-PAIR PRODUCTION IN HADRON-HADRON COLLISIONS AT HIGH ENERGIES\*

Sidney D. Drell and Tung-Mow Yan

Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305

(Received 25 May 1970)

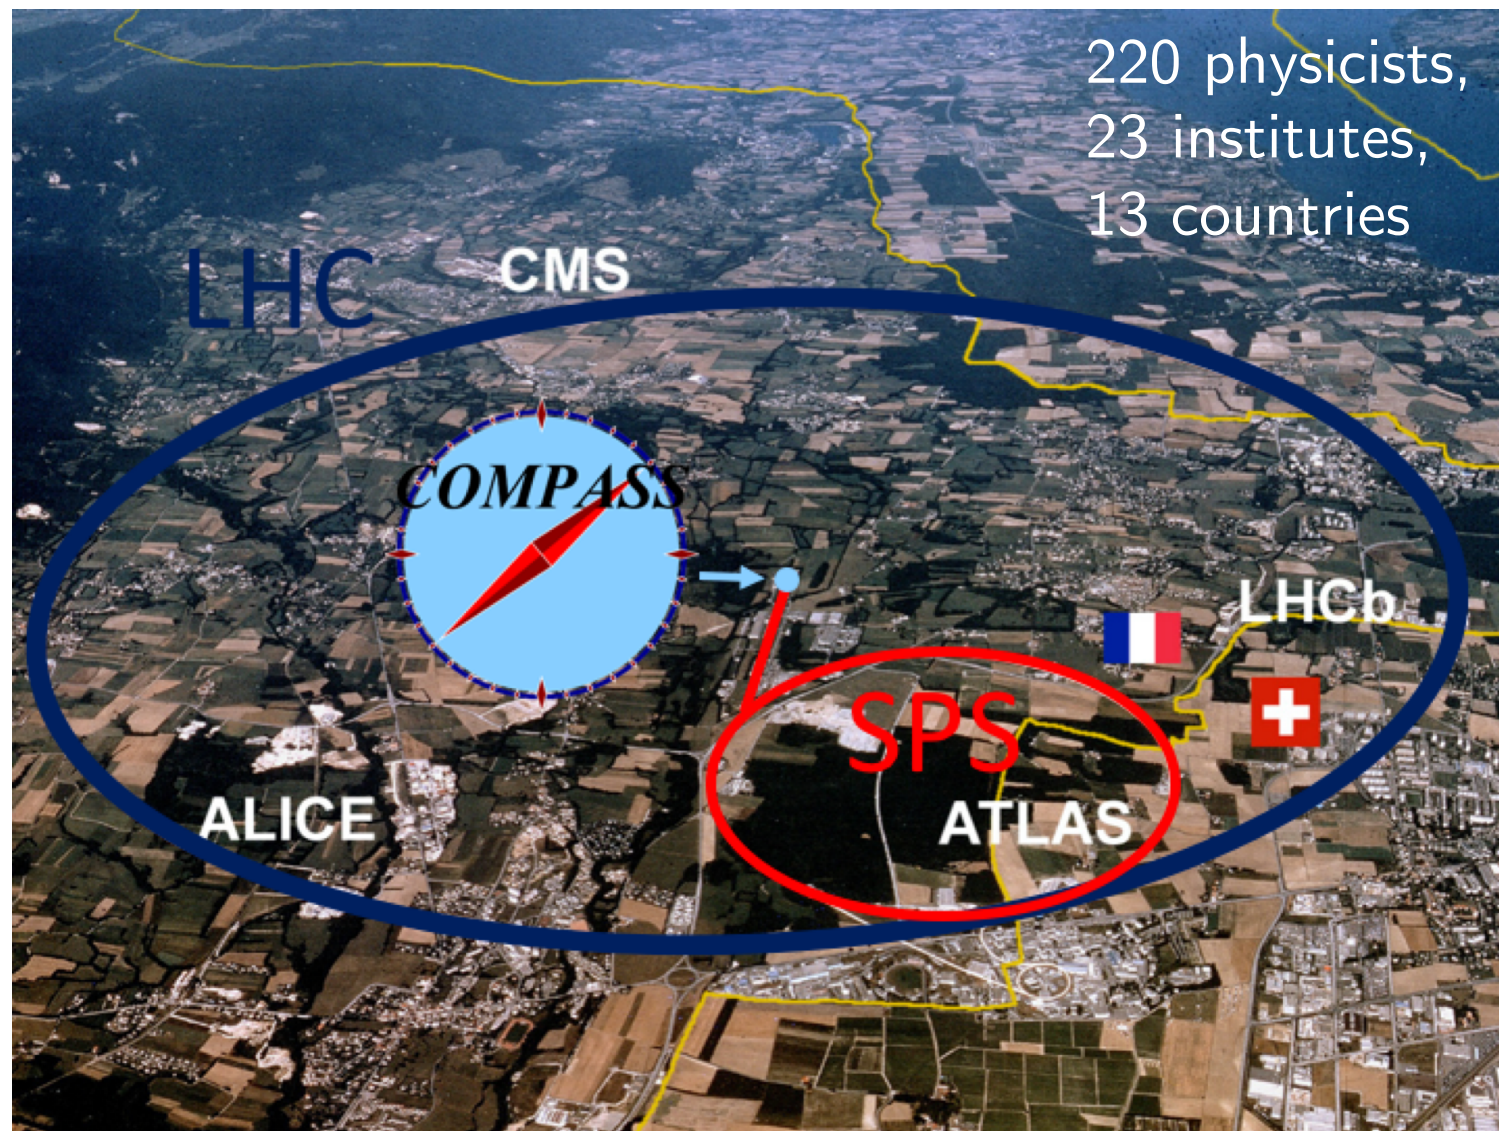

Study of two Transverse Momentum Dependent PDFs:

Complementary  
**Drell-Yan**  $\longleftrightarrow$  **Semi-Inclusive Deep-Inelastic Scattering (SIDIS)**.  
 Simple process  $\longleftrightarrow$  Hadron Fragmentation

- $f_{1T}^\perp$ : the Sivers function, which required a transversely polarized target
- $h_1^\perp$ : the Boer-Mulders function

► low cross-section, therefore we need to run at the highest luminosity possible.

# The Common Muon Proton Apparatus for Structure and Spectroscopy Experiment

# The COMPASS Spectrometer

Length of the Spectrometer: 60 m

Two stages spectrometer:

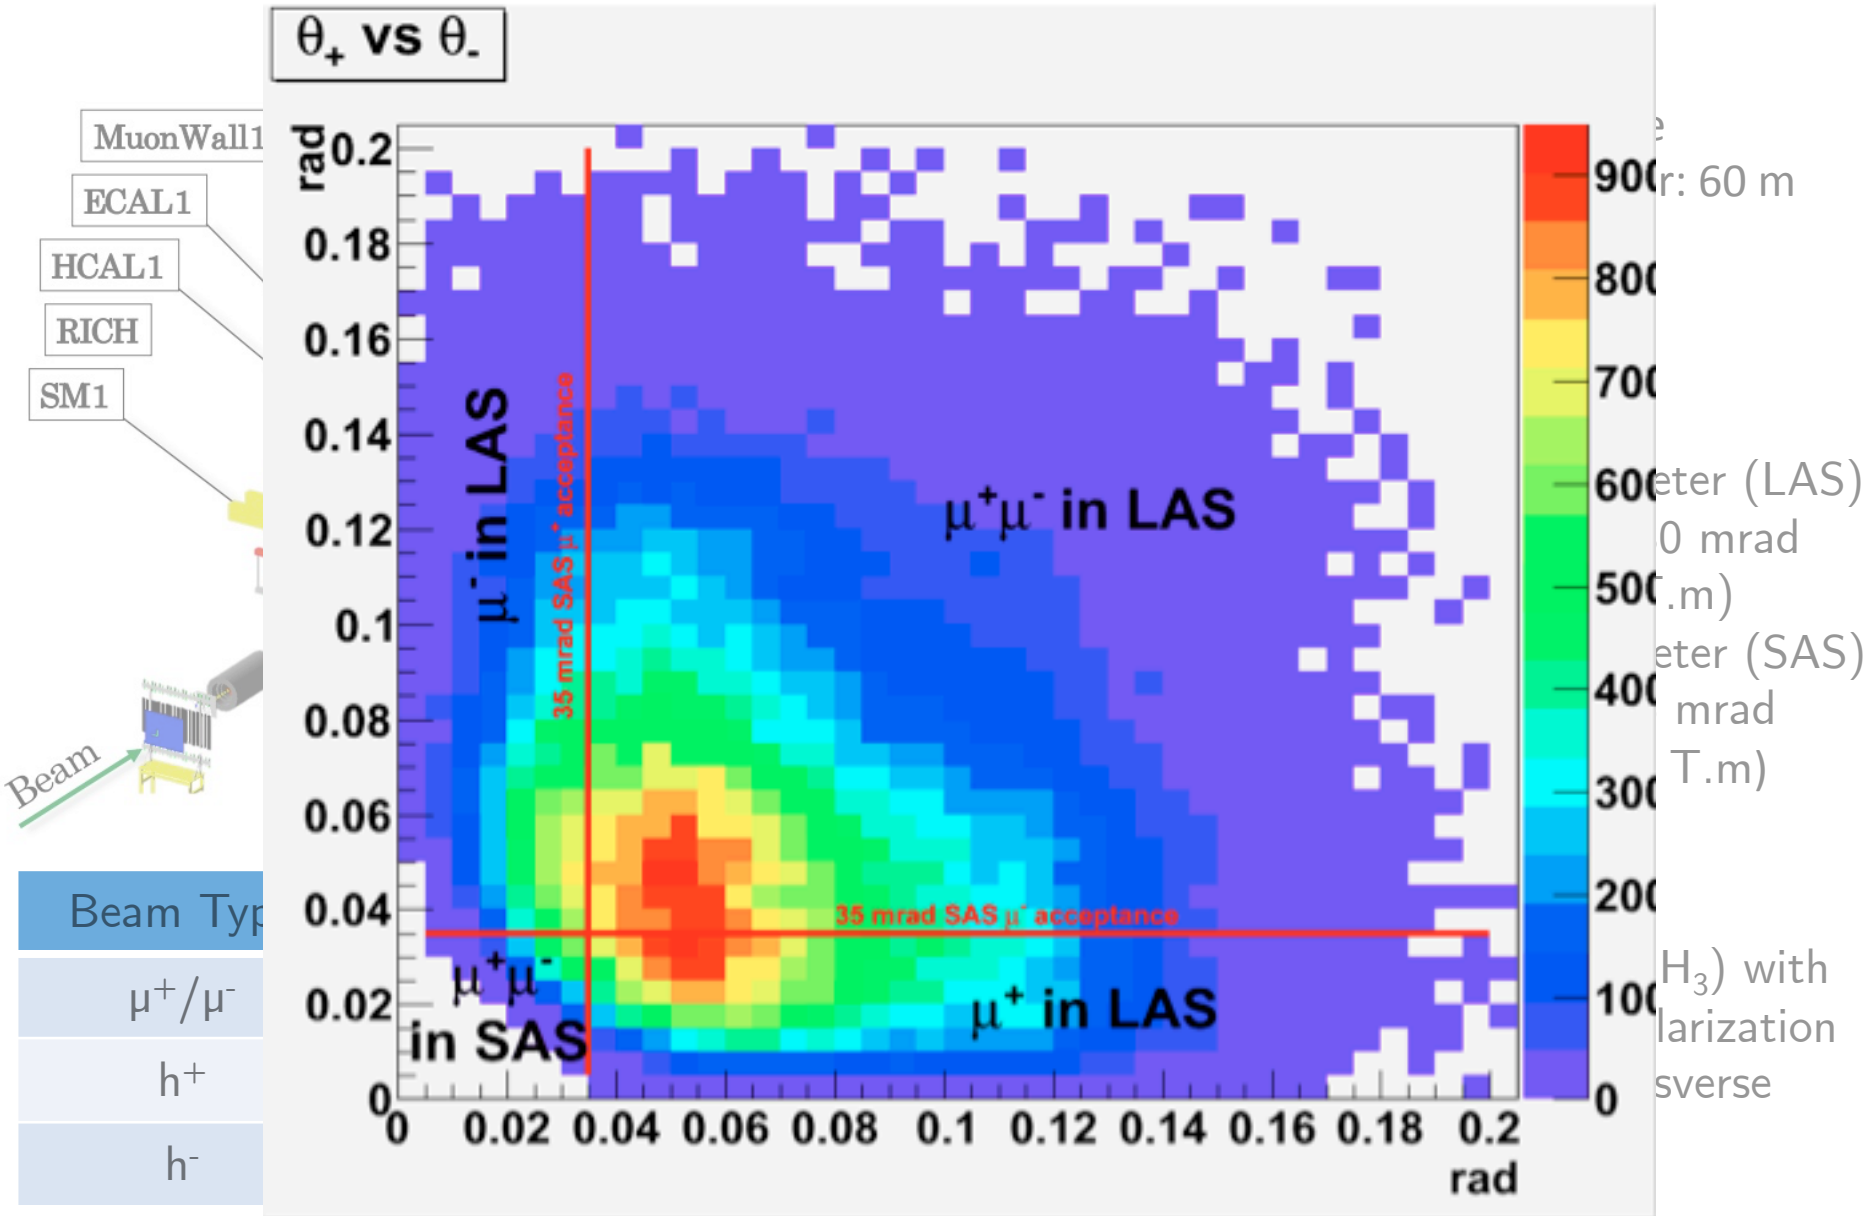

- Large Angle Spectrometer (LAS)
  - $35 \text{ mrad} < \Theta < 180 \text{ mrad}$
  - SM1 magnet (1 T.m)
- Small Angle Spectrometer (SAS)
  - $18 \text{ mrad} < \Theta < 35 \text{ mrad}$
  - SM2 magnet (4.4 T.m)

Beam Type	Details
$\mu^+/\mu^-$	160/200 GeV
$h^+$	190 GeV, $p/\pi/K$ 75/24/1%
$h^-$	190 GeV, $\pi/K/p$ 97/2/1%

Polarized Target:

- Polarized protons ( $\text{NH}_3$ ) with Dynamic Nuclear Polarization
- Longitudinal & Transverse Polarization
- $\sim 80\text{-}90\%$

Event display from the COMPASS reconstruction program: CORAL

# Procedure to achieve nominal performance

## Prepare the data

- From raw data; reconstruction of tracks using CORAL and excluding the detector view to analyze

## Run PHysics Analysis Software Tools (PHAST)

- PHAST will use preset RT relation for the analysis.
- Creation of different plots, such as the efficiencies and residuals of the analyzed views (show the precision and accuracy of the view)

## Make a better RT relation fit

- Make a new fit for the RT histogram and obtain a new RT relation

## Run PHAST again with the new RT relation

- Comparison before and after the new fit

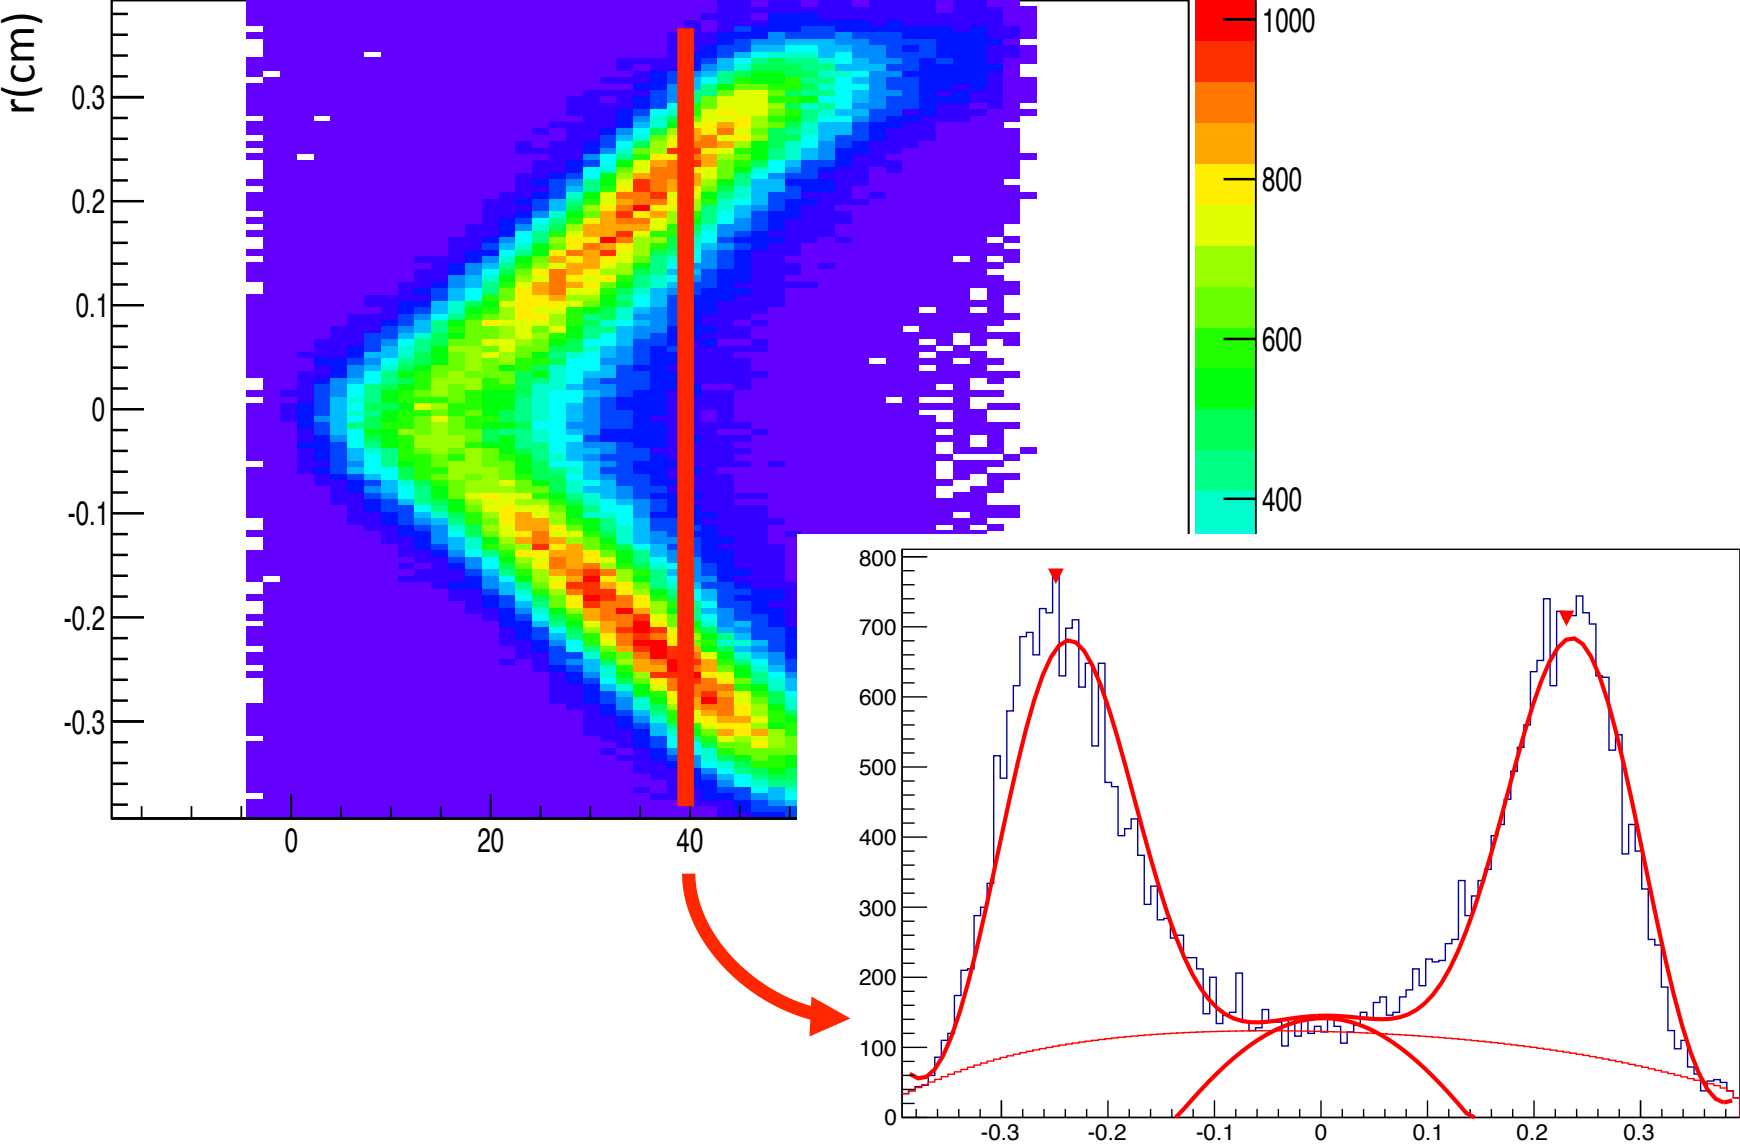

# Example - DC00 X view

# Example - DC00 X view

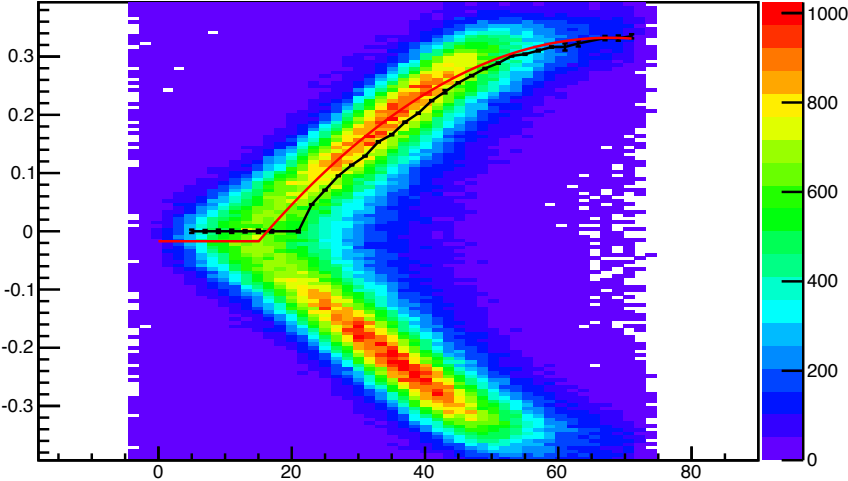

# Example - DC00 X view

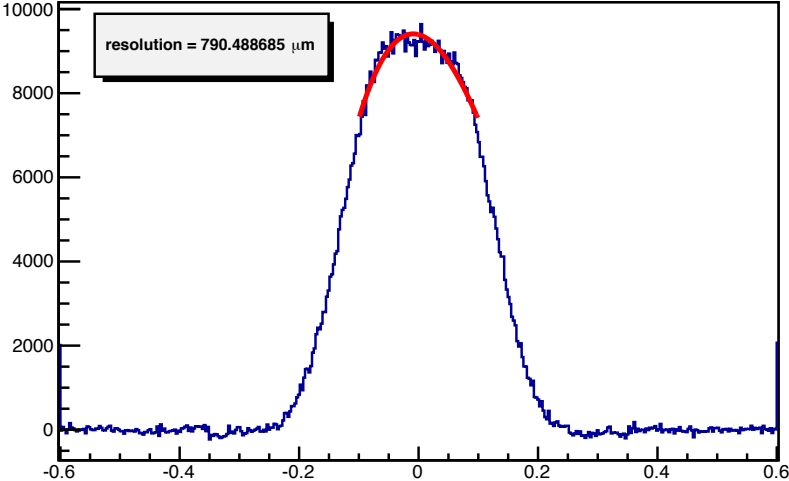

# Example - DC00 X view

High Intensity hadron beam:  $4.77 \times 10^8$  particles/sec

DC00X1\_\_: R vs. T

DC00X: DbL Residuals in bins of u(cm)

DC00X2\_\_: R vs. T

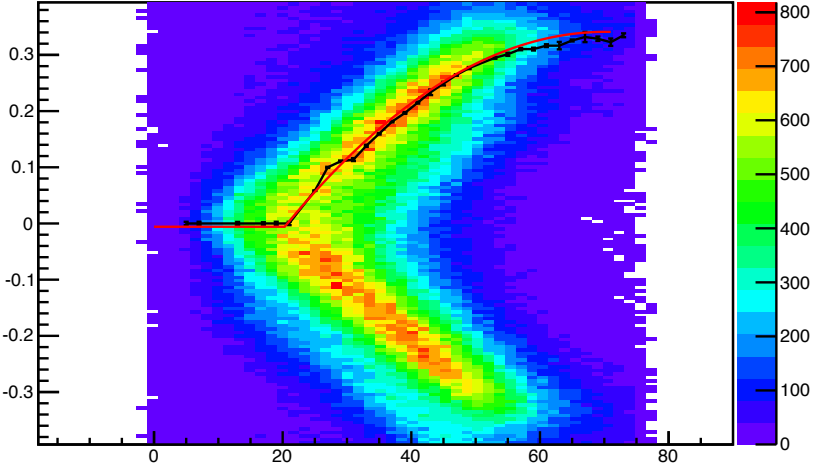

DC00X: DbL Residuals in bins of u(cm)

# Results

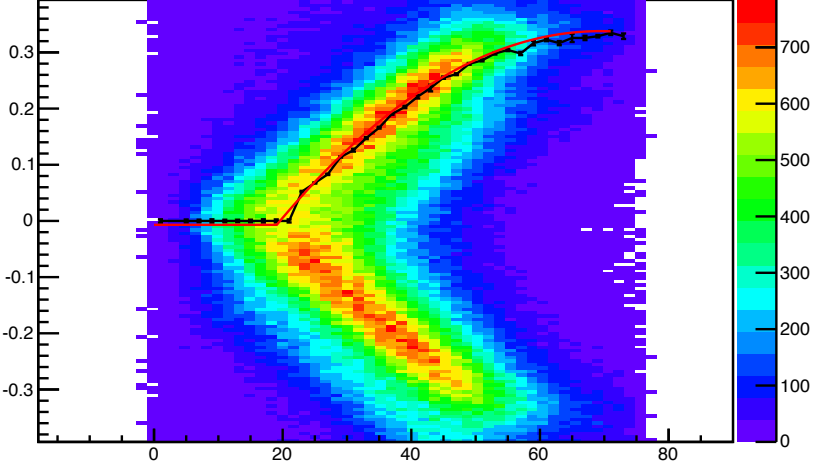

DC00Y1\_\_\_: R vs. T

DC00Y: DbL Residuals in bins of u(cm)

DC00Y2\_\_\_: R vs. T

DC00Y: DbL Residuals in bins of u(cm)

# Conclusion and Future Work

- **DC05 was successfully installed and is taking data!**

- Production of new RT relations for DC00, DC01 and DC04, improved the spatial resolution of the drift chambers
- We now have the tools to analyze other tracking detectors such as DC05 and ST03
- Questions:
  - Dependence on intensity?
  - Radial position dependence of the RT relation?

# Backup II

# Backup III

In COMPASS we have the opportunity to access these TMD PDFs from both DY and SIDIS processes.

There is a **phase space overlap** between the two measurements.
