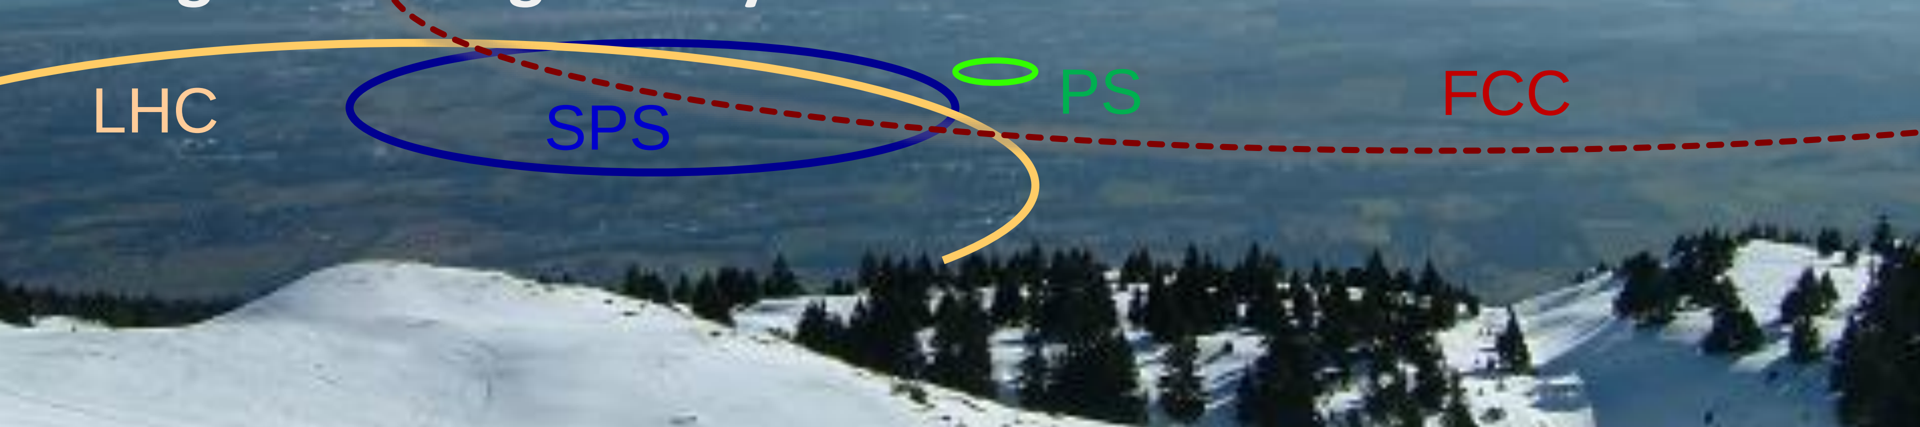
Future Circular Collider Study

Status and Parameter Update

M. Benedikt

gratefully acknowledging input from FCC coordination group
global design study team and all other contributors



http://cern.ch/fcc

*Work supported by the **European Commission** under the HORIZON 2020 project EuroCirCol, grant agreement 654305*

Outline

Introduction

- Motivation and Scope
- Study Timeline

Study Progress

- Implementation and Layout
- Machine parameters and optics
- Machine-Detector Activities, Technologies

FCC Collaboration Status

Outlook

FCC Strategic Motivation

- **European Strategy for Particle Physics 2013:**

  "…to **propose an ambitious post-LHC accelerator project**….., CERN should undertake design studies for accelerator projects in a global context,…with emphasis on proton-proton and electron-positron high-energy frontier machines….coupled to a vigorous accelerator R&D programme, including high-field magnets and high-gradient accelerating structures,…."

- **US P5 recommendation 2014:**

  "….A very high-energy proton-proton collider is the most powerful tool for direct discovery of new particles and interactions under any scenario of physics results that can be acquired in the P5 time window…."

- **ICFA statement 2014:**

  "…. ICFA supports studies of energy frontier circular colliders and encourages global coordination….."

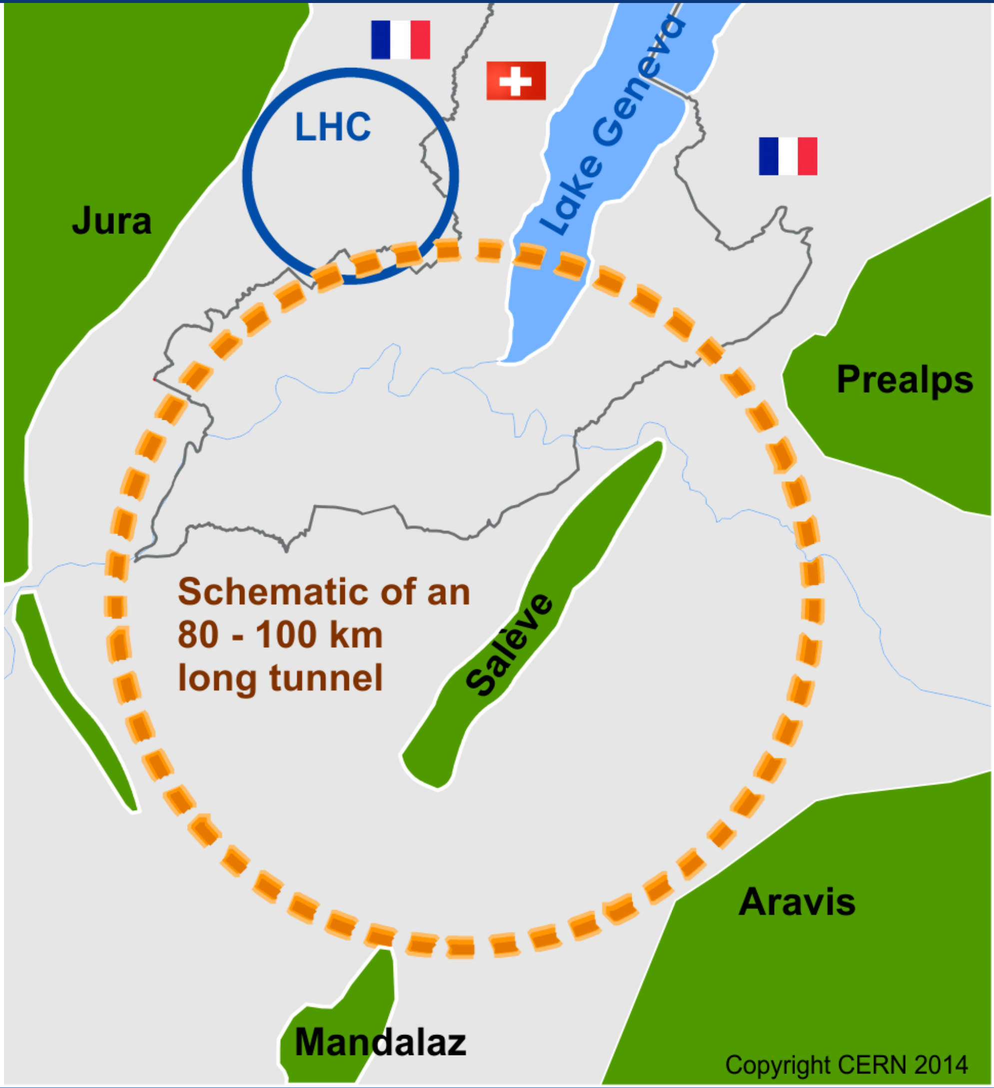
Future Circular Collider Study
GOAL: CDR and cost review for the next ESU (2019)

International FCC collaboration (CERN as host lab) to study:

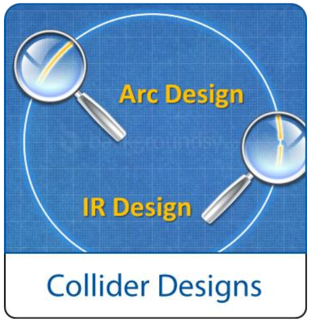
- ***pp*-collider (*FCC-hh*)**
  → main emphasis, defining infrastructure requirements

  ~16 T ⇒ 100 TeV *pp* in 100 km

- **80-100 km tunnel infrastructure** in Geneva area
- ***e⁺e⁻* collider (*FCC-ee*)** as potential first step
- ***p-e* (*FCC-he*) option**
- **HE-LHC** with *FCC-hh* technology

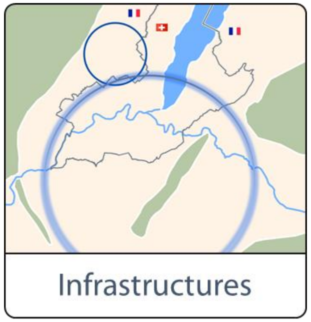


FCC Scope: Accelerator and Infrastructure



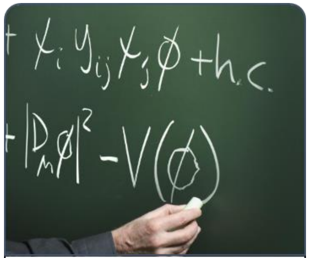
FCC-hh: **100 TeV pp collider as long-term goal**
→ defines infrastructure needs
FCC-ee: **e^+e^- collider**, potential intermediate step
HE-LHC: **based on FCC-hh technology**

key technologies
pushed in dedicated R&D programmes, e.g.
16 Tesla magnet program
SRF technologies and RF power sources



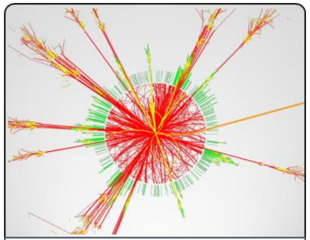
tunnel infrastructure in Geneva area, linked to CERN accelerator complex;
site-specific, as requested by European strategy

FCC Scope: Physics & Experiments



Physics Cases

physics opportunities for hh, ee and he discovery potentials



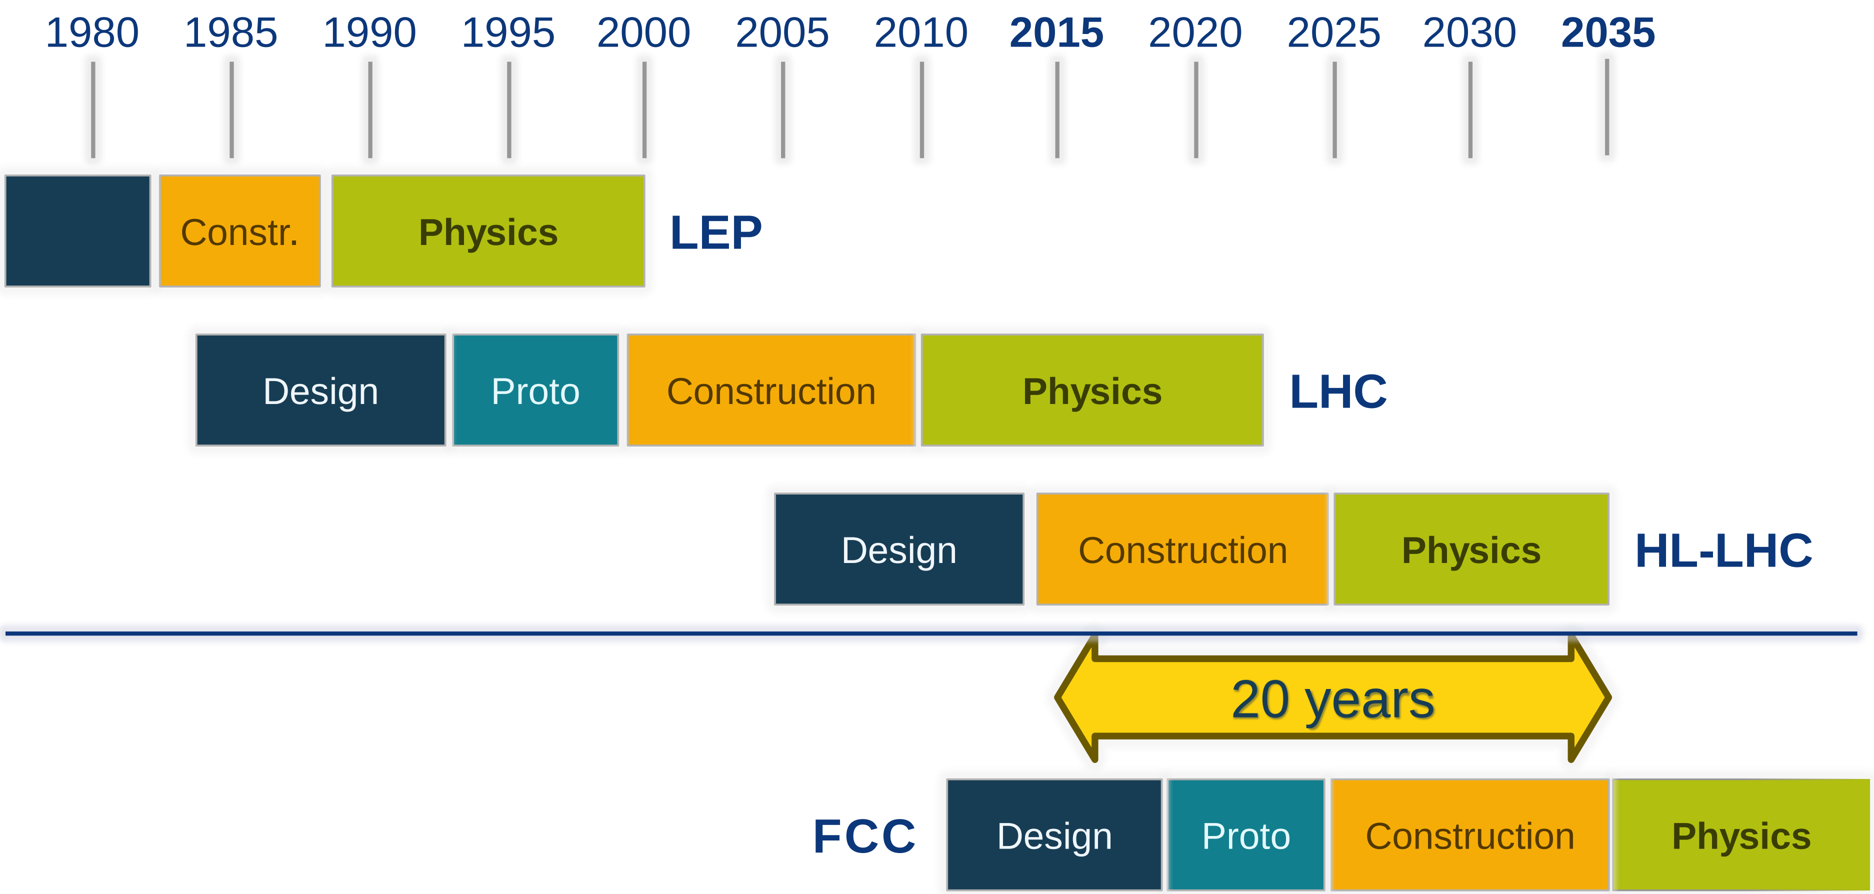
Experiments

experiment concepts for hh, ee and he
machine Detector Interface studies
concepts for **worldwide data services**

Cost Estimates

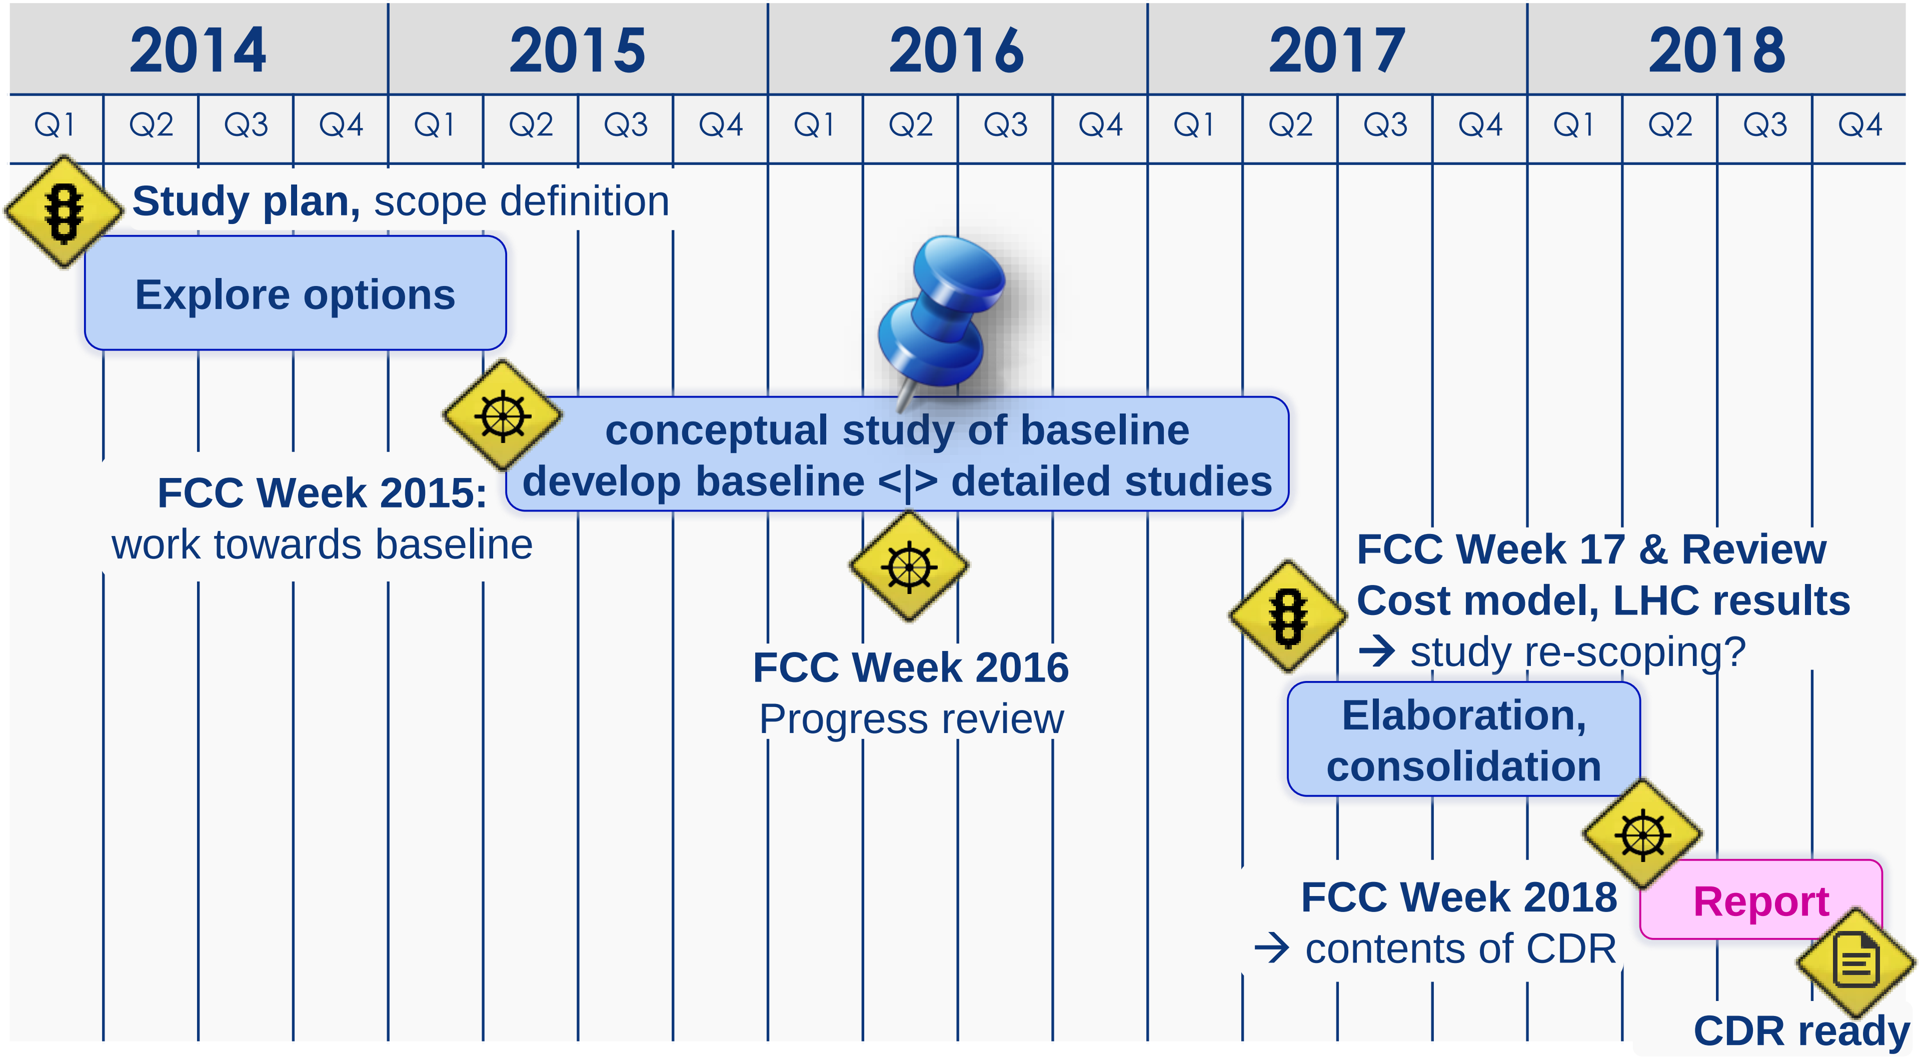
overall cost model ;
cost scenarios for collider options including infrastructure and injectors ;
implementation and governance models

CERN Circular Colliders & FCC



Now is the time to plan for the period 2035 – 2040

CDR Study Time Line



Status and Progress

Progress on site investigations

	CP 1		CP 2	
	Angle	Depth	Angle	Depth
LHC	-64°	220m	64°	172m
SPS		242m		241m
TI2		235m		241m
TI8		242m		170m

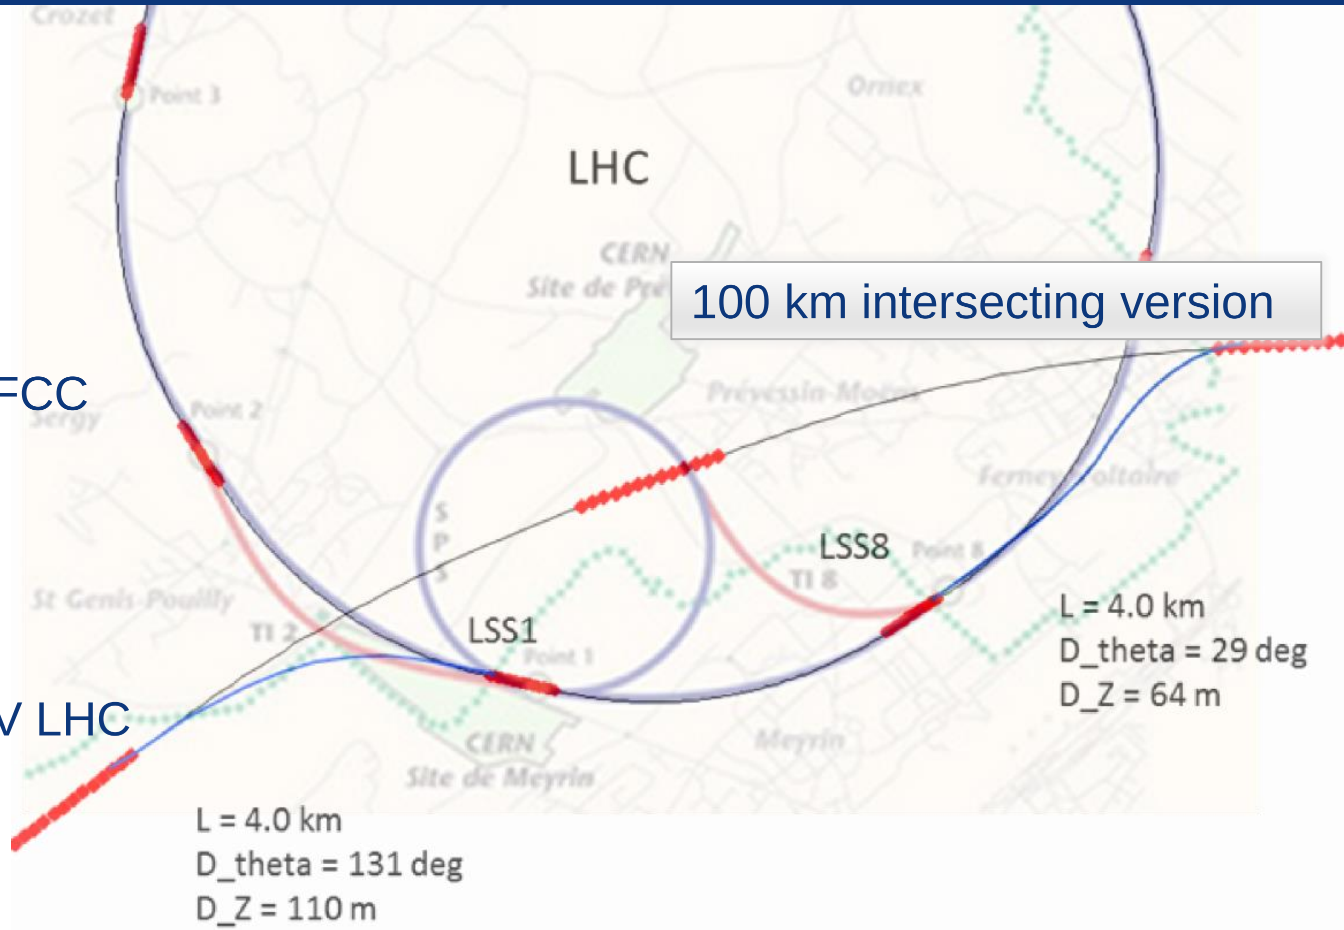
	Shaft Depth (m)			Geology (m)			
Point	Actual	Molasse SA	Wildflysch	Quaternary	Molasse	Urgonian	Calcaire
A	304	0	0	12	213	0	79
B	266	0	0	80	156	0	30
C	257	0	0	58	199	0	0
D	272	52	0	40	181	0	0
E	132	0	0	64	68	0	0
F	392	0	0	40	296	0	56
G	354	0	0	116	237	0	0
H	268	0	0	0	268	0	0
I	170	0	0	12	158	0	0
J	315	0	0	22	293	0	0
K	221	0	0	52	169	0	0
L	260	0	0	21	239	0	0
Total	3211	52	0	517	2478	0	109

- 90 – 100 km fits geological situation well
- Review confirmed focus on 100 km, planar version
- LHC suitable as potential injector
- The 100 km version, intersecting LHC, is being studied now in more detail

FCC-hh injector studies

Injector options:

- **SPS → LHC → FCC**
- SPS/SPS$_{upgrade}$ → FCC
- SPS -> FCC booster → FCC



Current baseline:

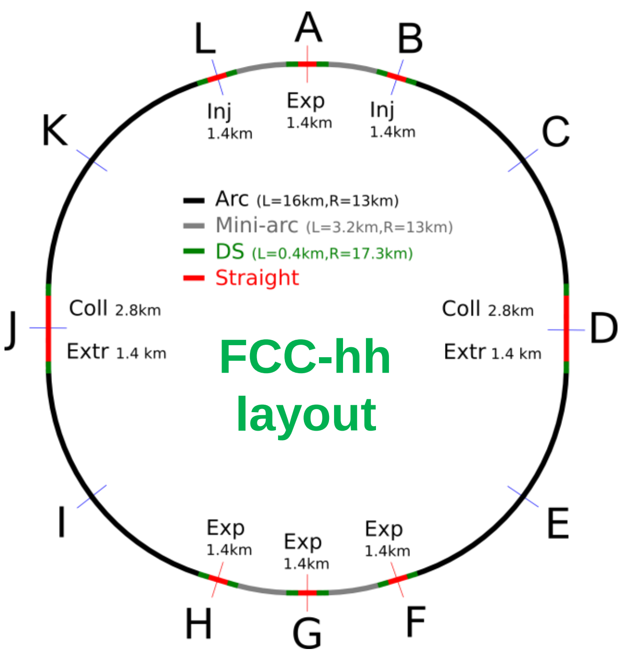
- injection energy 3.3 TeV LHC
- confirmed by review

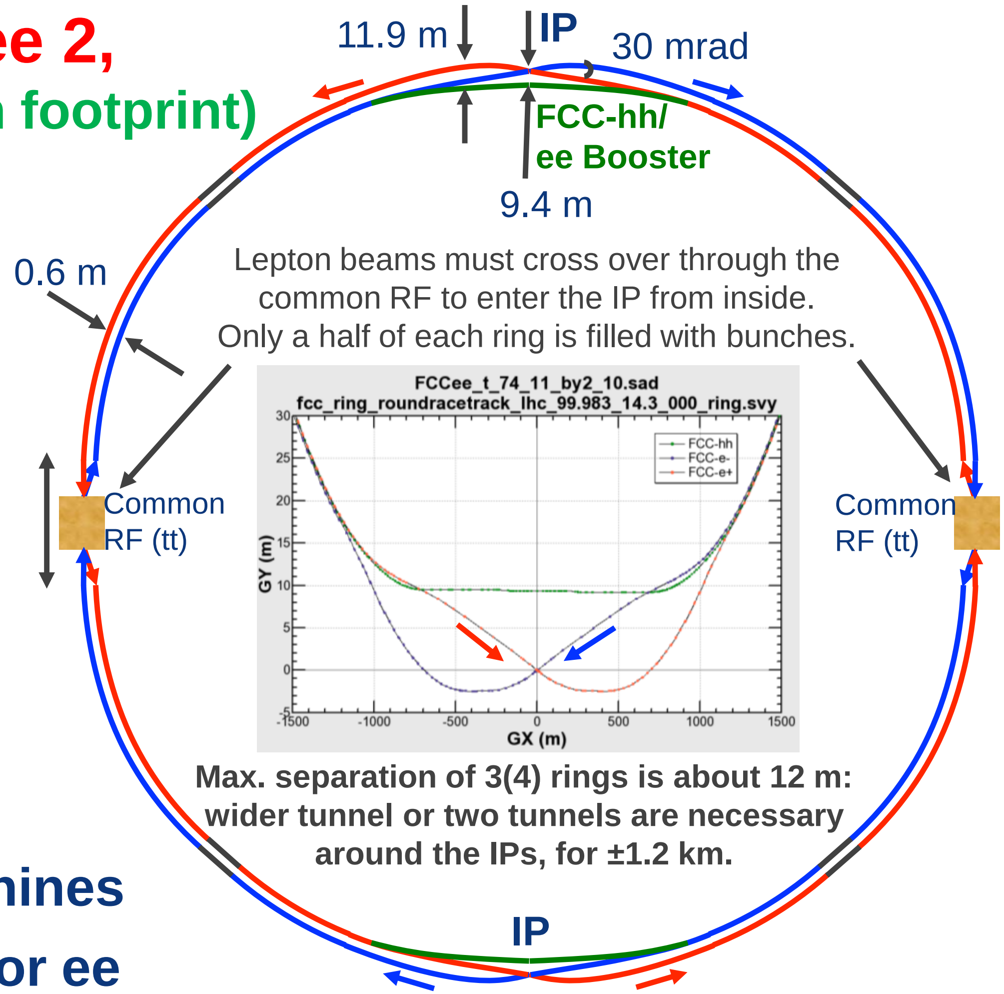
Alternative options:

- Injection around 1.5 TeV
- compatible with: SPS$_{upgrade}$, LHC, FCC booster

Common layouts for hh & ee

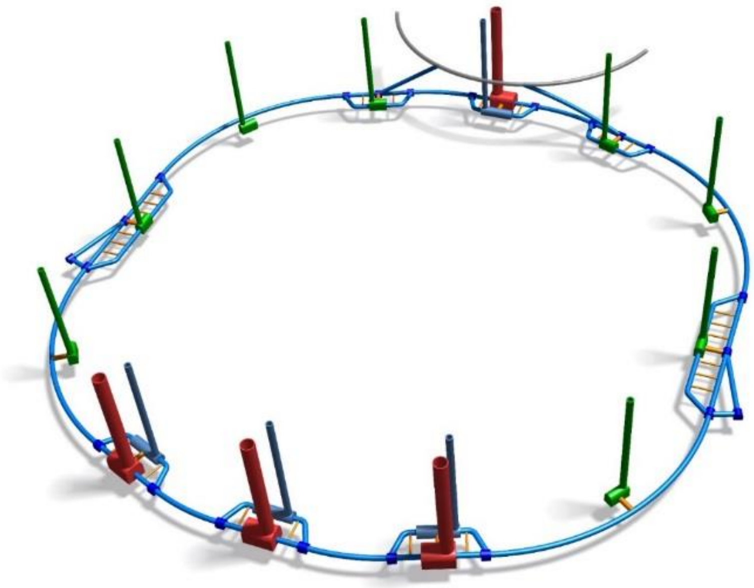
FCC-ee 1, FCC-ee 2, FCC-ee booster (FCC-hh footprint)

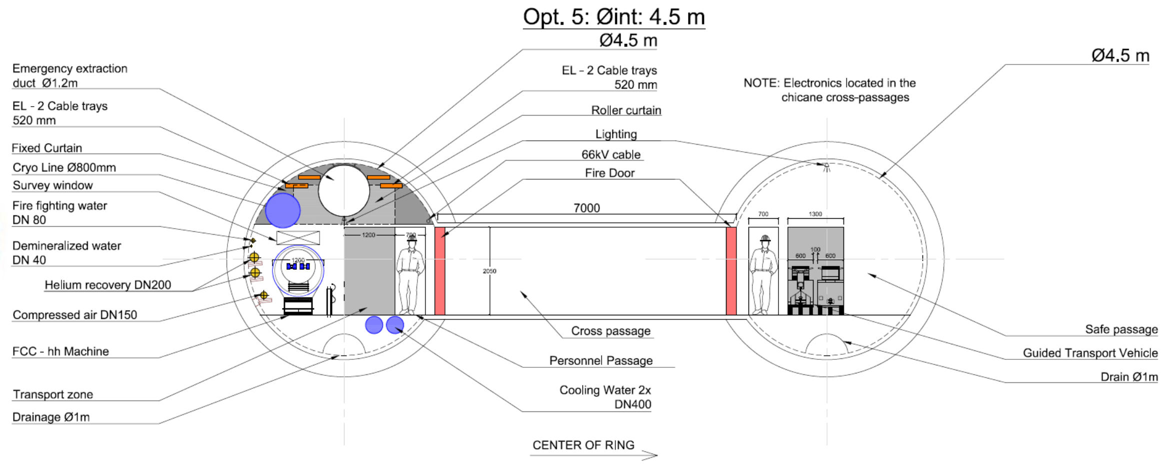




- **2 main IPs in A, G for both machines**
- **asymmetric IR optic/geometry for ee to limit synchrotron radiation to detector**

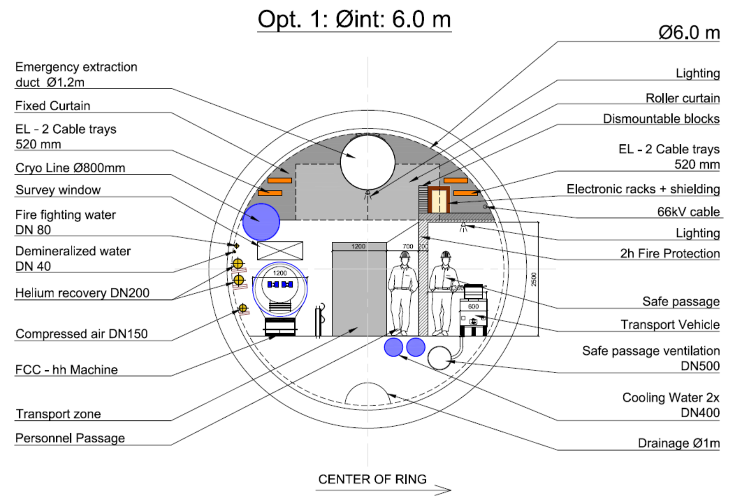
Further CE and TI optimisation





More detailed studies launched on

- CE: single vs. double tunnels
- CE: caverns, shafts, underground layout
- technical infrastructures
- safety, access
- transport, integration, installation
- operation aspects



hadron collider parameters

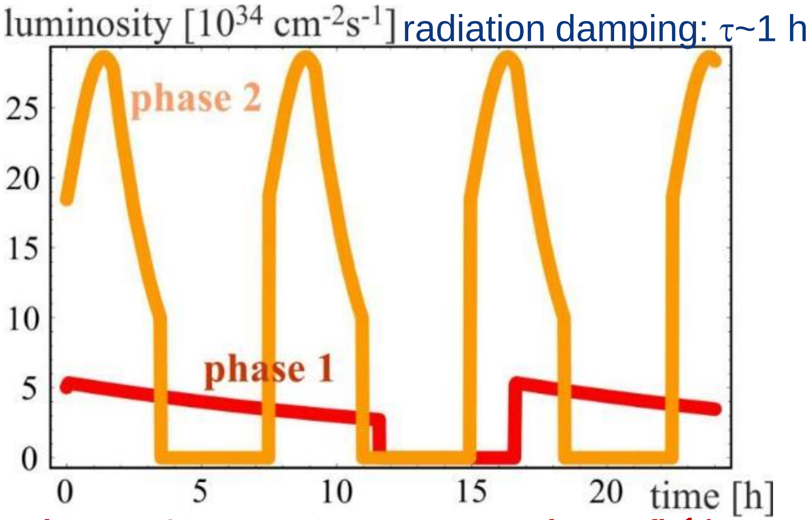
parameter	FCC-hh		SPPC	HE-LHC* *tentative	(HL) LHC
collision energy cms [TeV]	100		71.2	>25	14
dipole field [T]	16		20	16	8.3
circumference [km]	100		54	27	27
# IP	2 main & 2		2	2 & 2	2 & 2
beam current [A]	0.5		1.0	1.12	(1.12) 0.58
bunch intensity [10^{11}]	1	1 (0.2)	2	2.2	(2.2) 1.15
bunch spacing [ns]	25	25 (5)	25	25	25
beta* [m]	1.1	0.3	0.75	0.25	(0.15) 0.55
luminosity/IP [10^{34} cm^{-2}s^{-1}]	5	20 - 30	12	>25	(5) 1
events/bunch crossing	170	<1020 (204)	400	850	(135) 27
stored energy/beam [GJ]	8.4		6.6	1.2	(0.7) 0.36
synchrotr. rad. [W/m/beam]	30		58	3.6	(0.35) 0.18

FCC-hh operation & luminosity

5 year long operation periods
- 3.5 years operation periods with
  - 1 year HW comm., MDs, short stops
  - 2.5 years lumi. run with 70% availability
- 1.5 year shutdown

2 periods at baseline parameters (10 yrs)
- **Peak luminosity 5×10^{34} cm^{-2}s^{-1}**
- **Total of 2.5ab^{-1} (per detector)**

3 periods at ultimate parameters (15 yrs)
- **Peak luminosity <=30×10^{34} cm^{-2}s^{-1}**
- **5ab^{-1} per period total of 15ab^{-1}**



phase 1: β^*=1.1 m, ΔQ_{tot}=0.01, t_{ta}=5 h, 250 fb^{-1} / year
phase 2: β^*=0.3 m, ΔQ_{tot}=0.03, t_{ta}=4 h, 1 ab^{-1} / year

O(20) ab^{-1} integrated luminosity/experiment

consistent with physics goal: 20 ab^{-1} in total

Detectors must sustain a total of >20ab^{-1} and >5ab^{-1} between maintenance stops
Machine design to support 3.5 year operation periods w/o warm up or long stops

Physics prospects

Physics at the FCC-hh

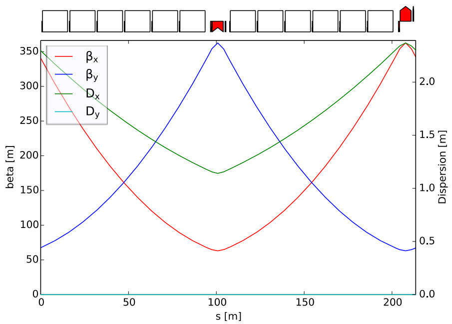
https://twiki.cern.ch/twiki/bin/view/LHCPhysics/FutureHadroncollider

- **Volume 1: SM processes** (238 pages)
- **Volume 2: Higgs and EW symmetry breaking studies** (175 pages)
- **Volume 3: beyond the Standard Model phenomena** (189 pages)
- **Volume 4: physics with heavy ions** (56 pages)
- **Volume 5: physics opportunities with the FCC-hh injectors** (14 pages)

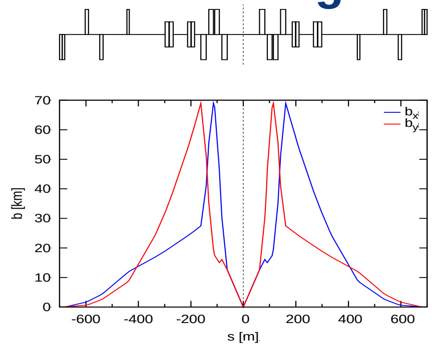
- **will be published as CERN yellow report**
- **paper copies available at registration desk**

FCC-hh full-ring optics design

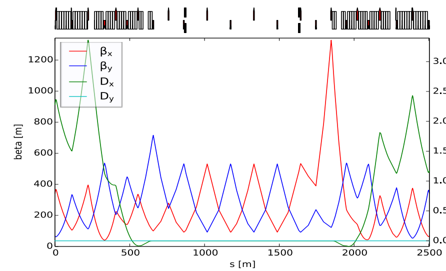
Regular arc cell



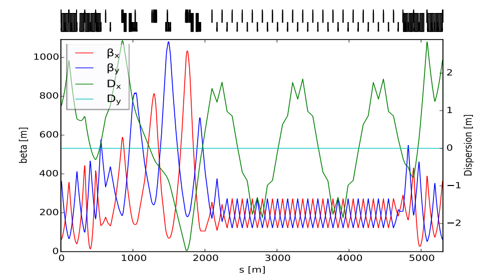
Interaction region

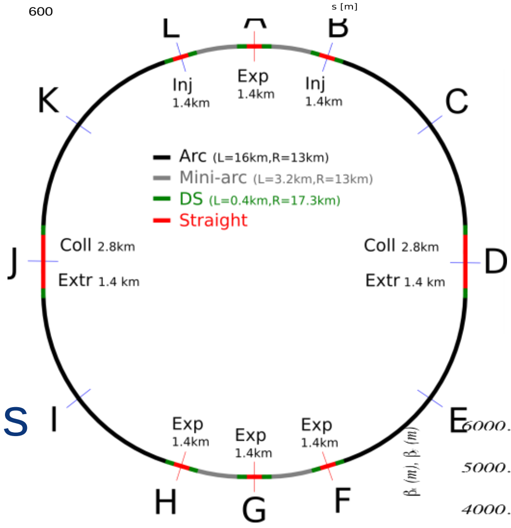


Injection with RF

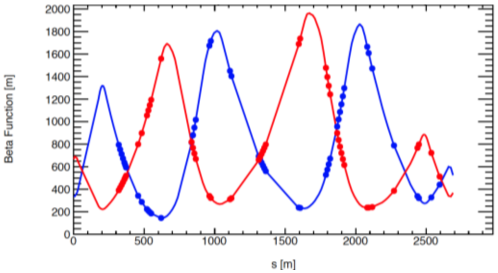


Momentum collim.

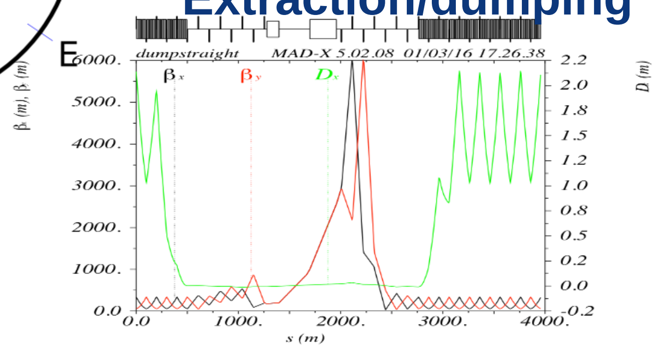




Betatron collimation



Extraction/dumping



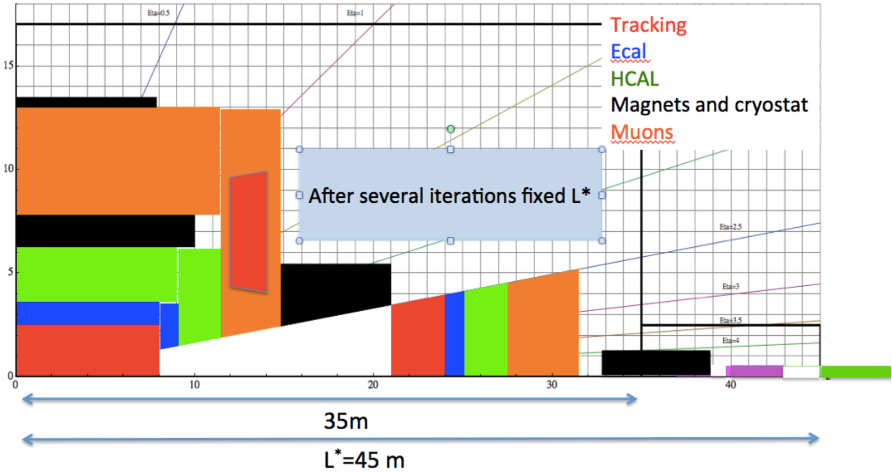
Full ring optics design available as basis for:

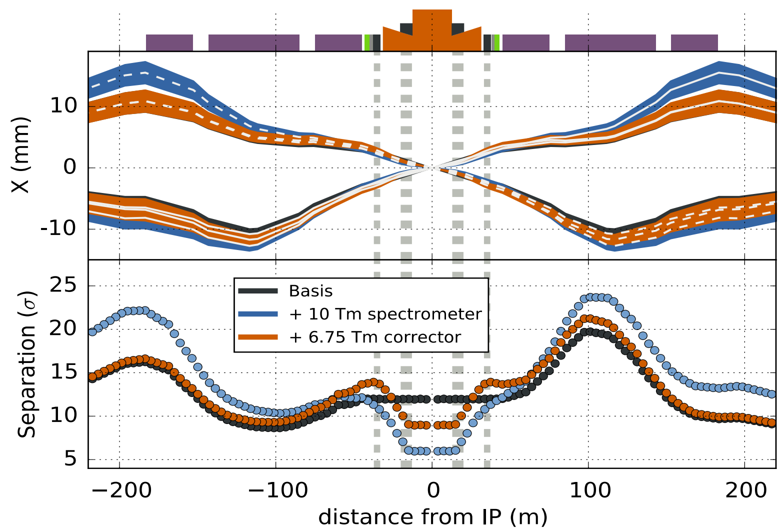
- beam dynamics studies
- optimisation of each insertion
- definition of system specifications (apertures, etc.)
- improvement of baseline optics and layout

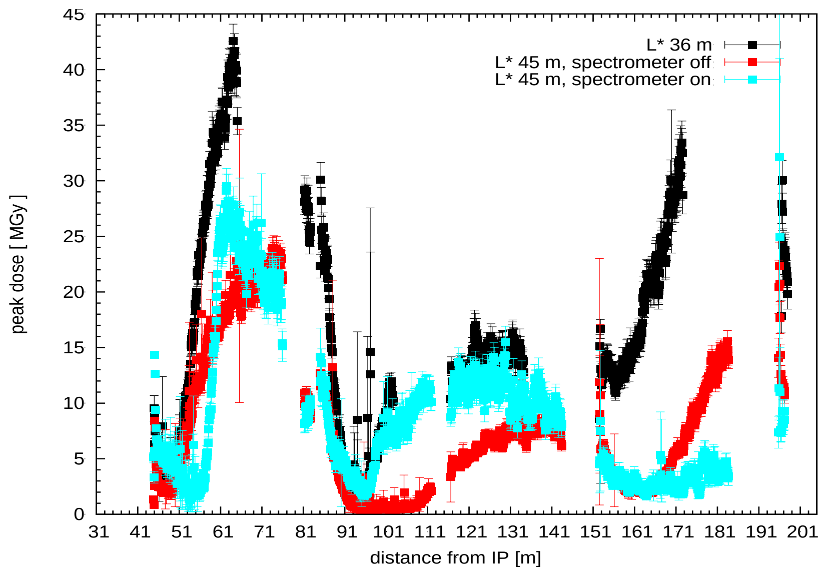
FCC-hh MDI status

Design of interaction region

- consistent for machine and detector
  - L^*=45 m
  - integrated spectrometer and compensation dipoles
- new optics design with longer triplet with large aperture
  - should help for collision debris
  - more beam stay clear

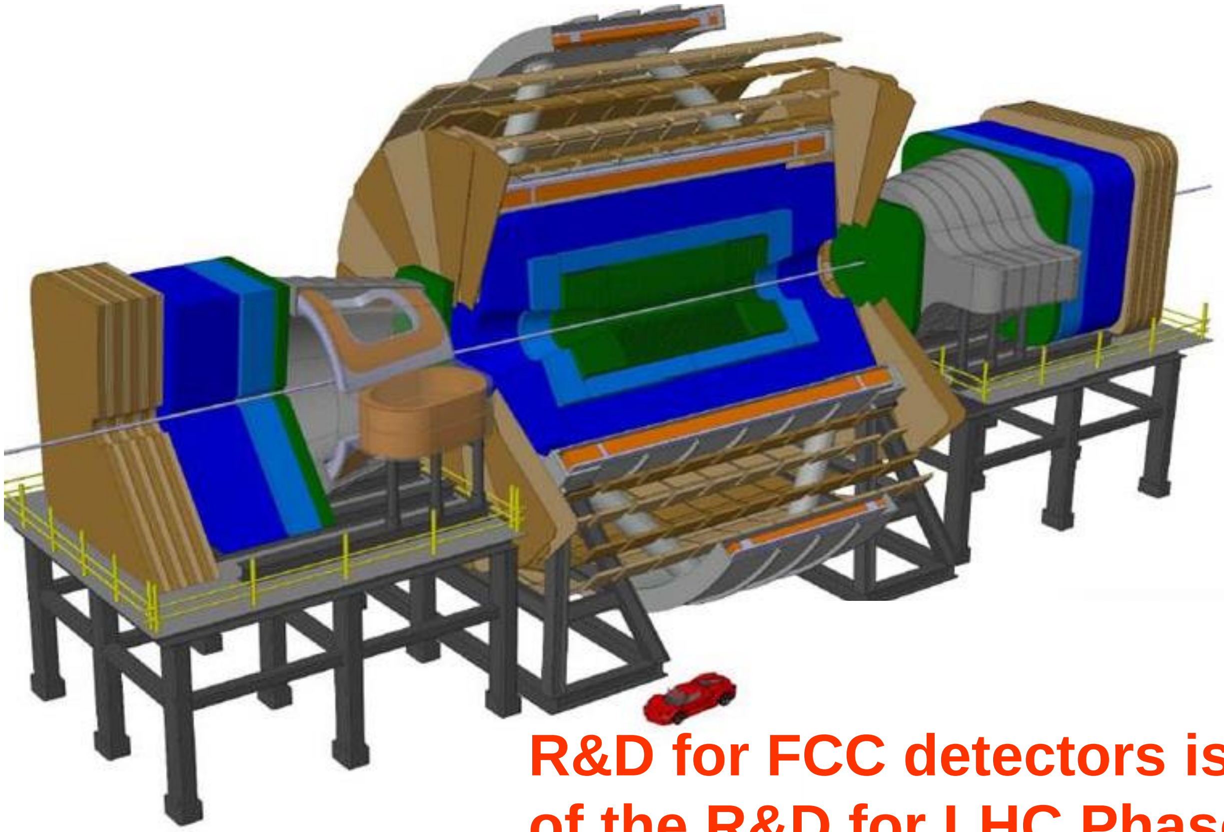






Detector Concepts for 100 TeV pp

A B=6 T, R=6 m solenoid with shielding coil and 2 dipoles has been engineered in detail.
Different alternative magnet systems are also being explored.



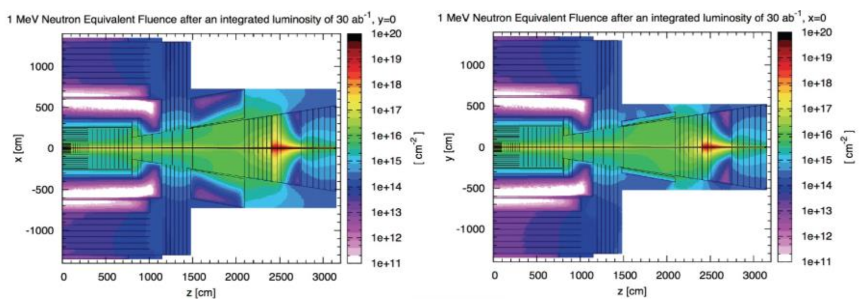
Some design challenges:

- **large η acceptance**
- **radiation levels of >50 x LHC Phase II**
- **pileup of ~1000**

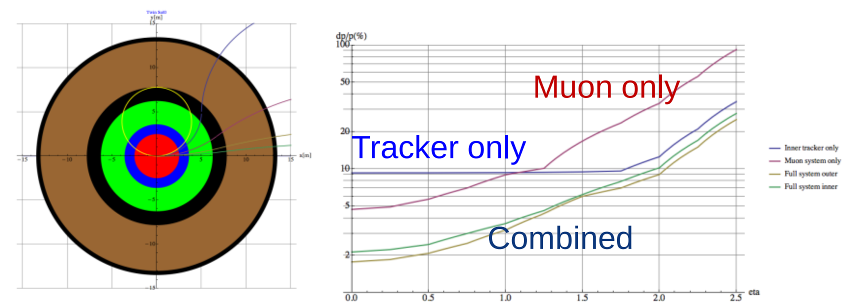
R&D for FCC detectors is a natural continuation of the R&D for LHC Phase II upgrade

Detector studies & simulation framework

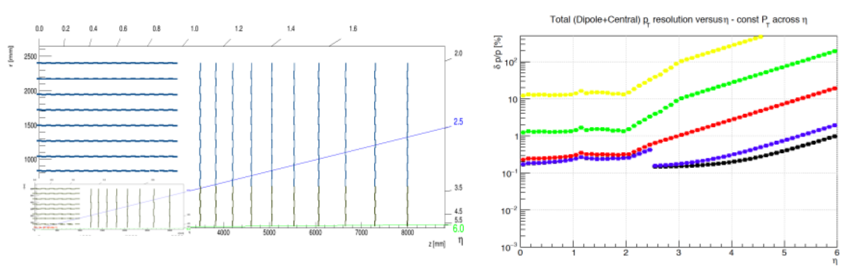
- **Detector studies well under way for hh and ee**
- **Parametrized detector performance model (DELPHES) available and integrated in FCC software framework for physics simulations**
  https://twiki.cern.ch/twiki/bin/view/FCC/FccPythiaDelphes



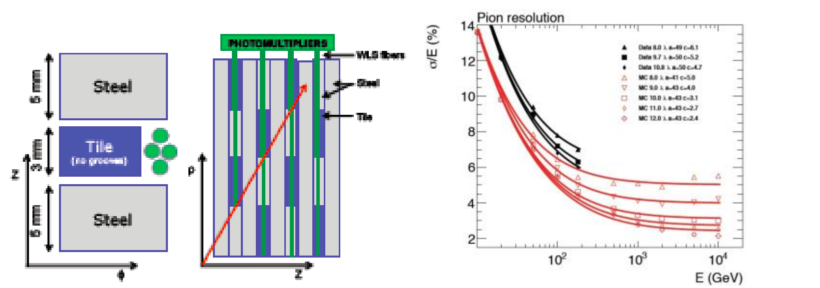
Radiation simulations, shielding requirements



Muon system performance & requirement studies



Tracker resolution, occupancy, data rate studies



Calorimeter resolution, containment studies

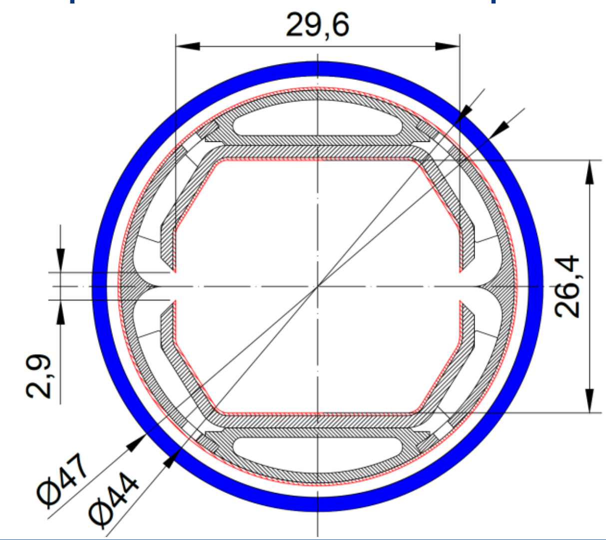
Synchrotron radiation/beam screen

High synchrotron radiation load of protons @ 50 TeV:

- **~30 W/m/beam (@16 T)** (LHC <0.2W/m)
- **5 MW total in arcs**

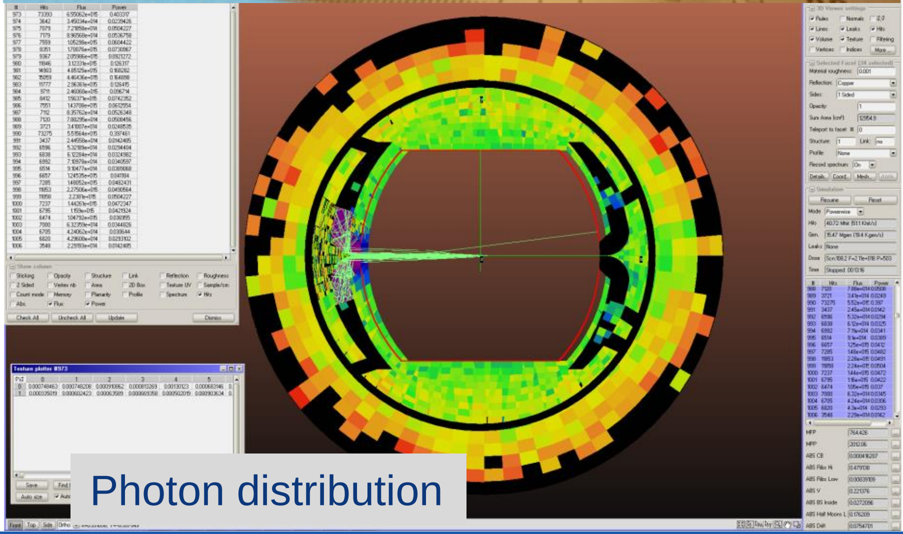
New Beam screen with ante-chamber

- absorption of synchrotron radiation at 50 K to reduce cryogenic power
- avoids photo-electrons, helps vacuum



First FCC-hh beam screen prototype

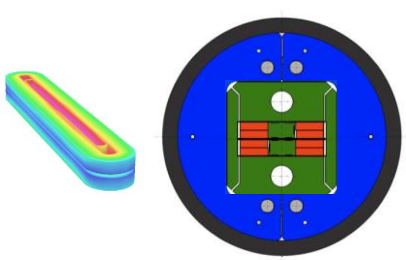
Testing 2017 in ANKA within EuroCirCol



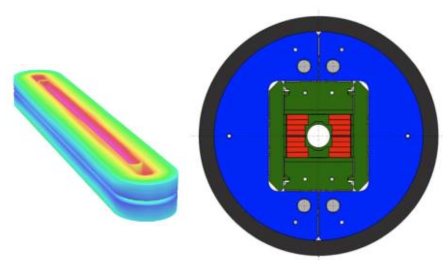
CERN & EuroCirCol 16T programs

Main Milestones of the FCC Magnet Program 2016 - 2019

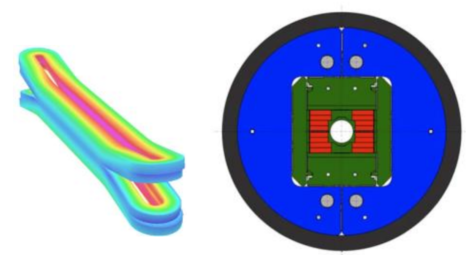
Milestone	Description	15	2016		2017		2018		2019		2020		21
M0	High J_c wire development with industry	■	■	■	■	■	■	■	■	■	■	■	■
M1	Supporting wound conductor test program	■	■	■	■	■	■	■	■	■	■	■	■
M2	Design & manufacture 16T ERMC with existing wire	■	■	■	■								
M3	Design & manufacture 16 T RMM with existing wire		■	■	■	■							
M4	Design & manufacture 16T demonstrator magnet			■	■	■	■	■					
M5	Procurement of enhanced high J_c wire				■	■	■	■	■				
M6	EuroCirCol design 16T accelerator quality model	■	■	■	■	■	■	■	■				
	Manufacture and test of the 16 T EuroCirCol model									■	■	■	■



ERMC (16 T mid-plane field)
mid 2017



RMM (16 T in 50 mm cavity)
end 2017



Demonstrator (16 T, 50 mm gap)
end 2018

Nb_3Sn conductor program

Nb_3Sn conductor is one of the major cost and performance factors for FCC-hh and must be given highest attention

- **Goals: J_c increase (16 T, 4.2 K) > 1500 A/mm², significant cost reduction**
- **Actions ongoing and planned (in addition to activities at CERN):**
  - Purchase of wires in Europe, US
  - Industrial R&D in Europe
  - Collaboration agreements with KEK, Russia, Korea (in preparation), to stipulate conductor development with regional industry
  - Collaborations with several European Universities and Research Centres
- **Strong industrial R&D program is highly desired also in the US**

High-Energy LHC

FCC study continues effort on **high-field collider in LHC tunnel**

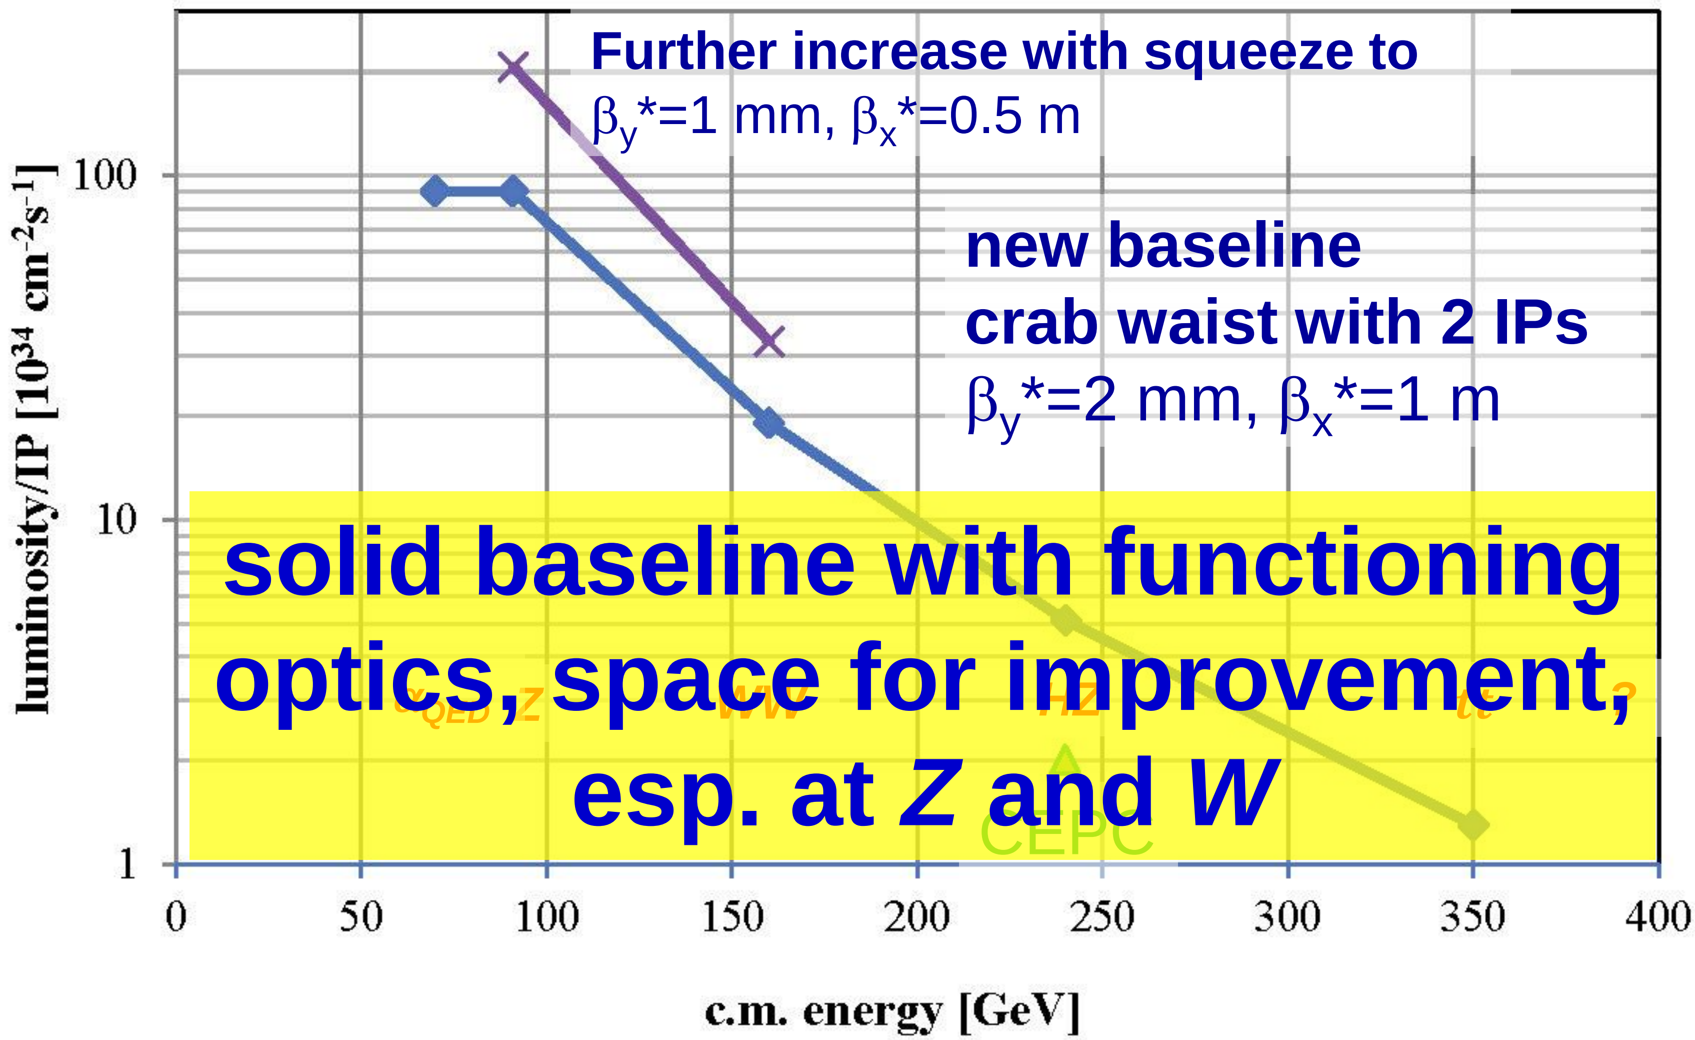
synchrotron power [MW]	**100**					103	22
RF voltage [GV]	0.4	**0.2**	**0.8**	**3.0**	**10**	6.9	3.5

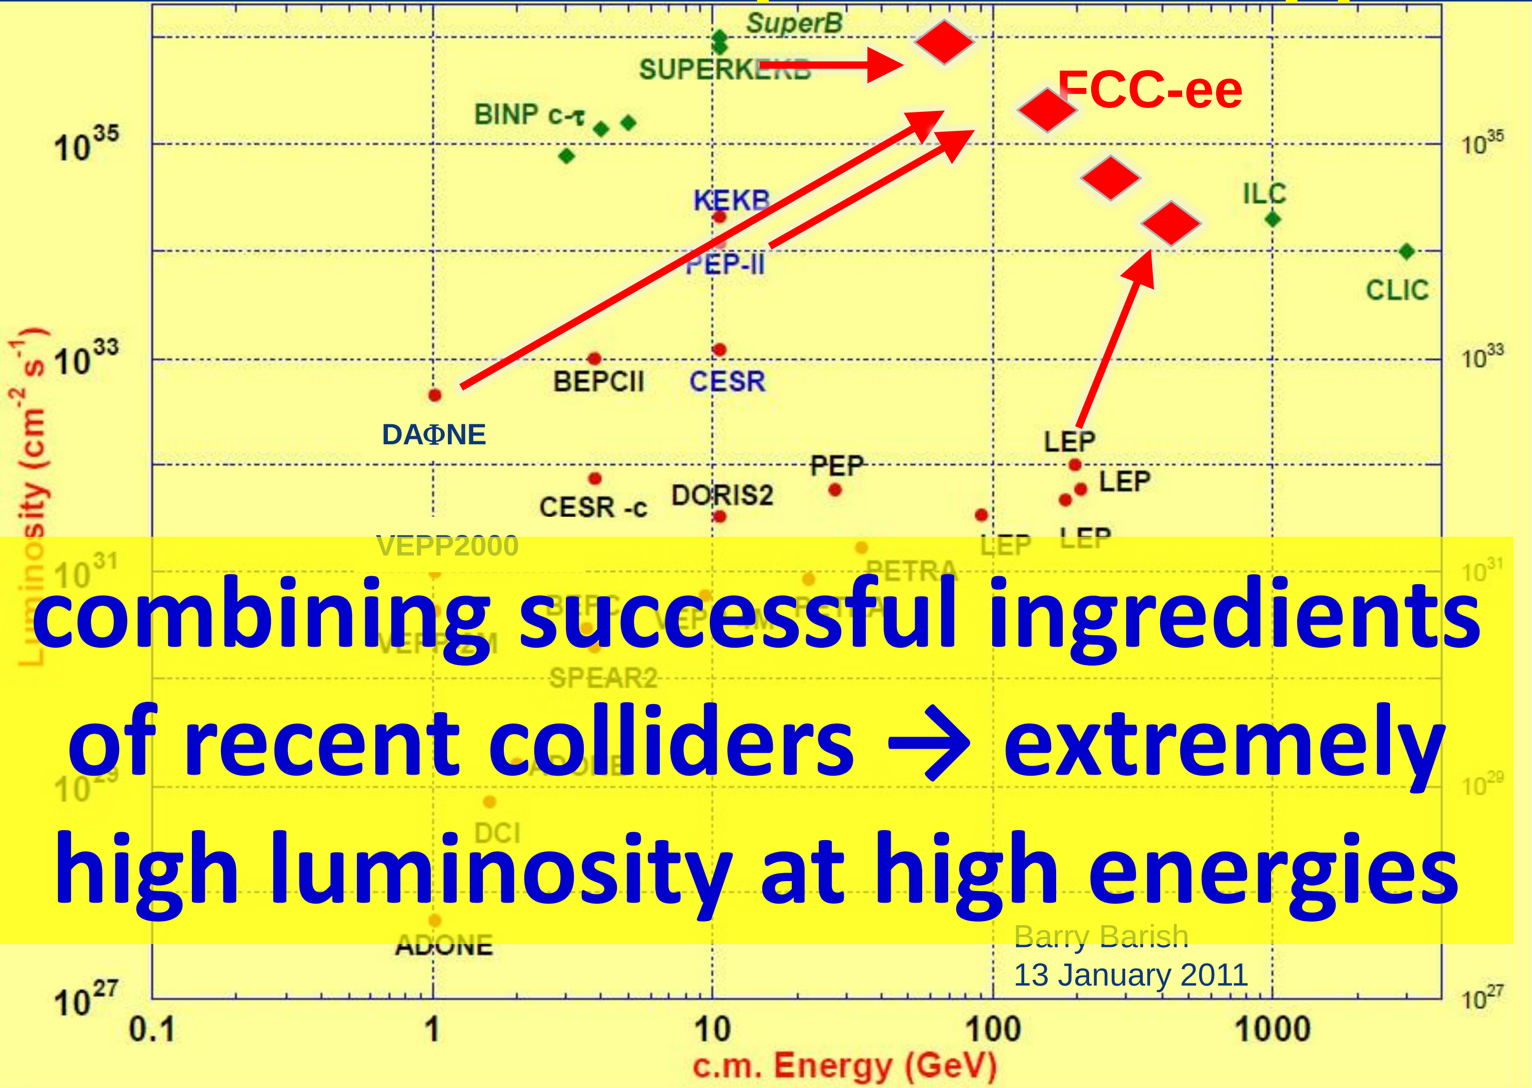
identical FCC-ee baseline optics for all energies

FCC-ee: 2 separate rings CEPC, LEP: single beam pipe

FCC-ee luminosity per IP



FCC-ee exploits lessons & recipes from past e^+e^- and *pp* colliders



combining successful ingredients of recent colliders → extremely high luminosity at high energies

LEP:
- high energy
- SR effects

B-factories:

KEKB & PEP-II:
- high beam currents
- top-up injection

DAFNE: crab waist

Super B-factories

S-KEKB: low β_y^*

KEKB: e^+ source

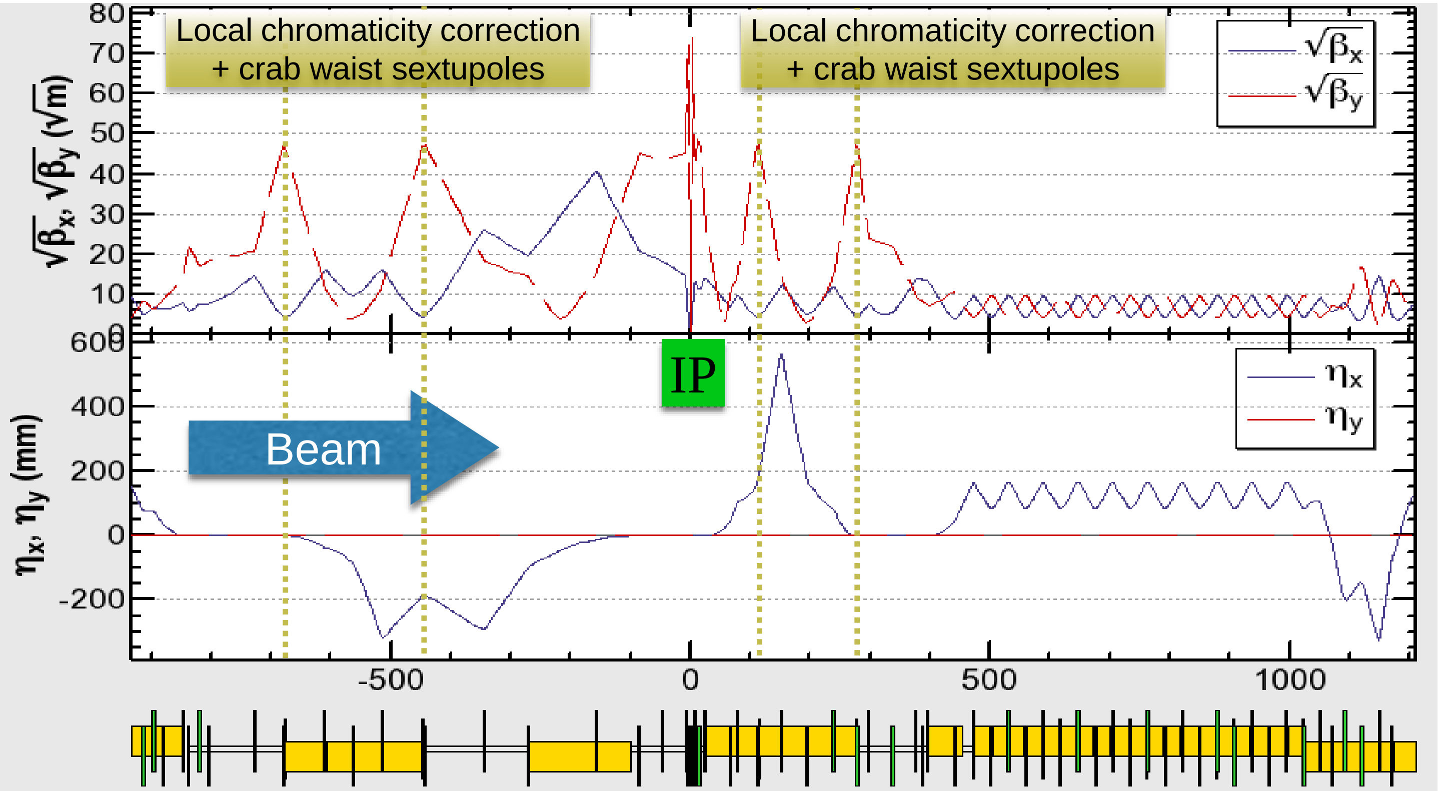
HERA, LEP, RHIC:
- spin gymnastics

FCC-ee optics design

Optics design for all working points achieving baseline performance

Interaction region: asymmetric optics design

- Synchrotron radiation from upstream dipoles <100 keV up to 450 m from IP
- Dynamic aperture & momentum acceptance requirements fulfilled at all WPs



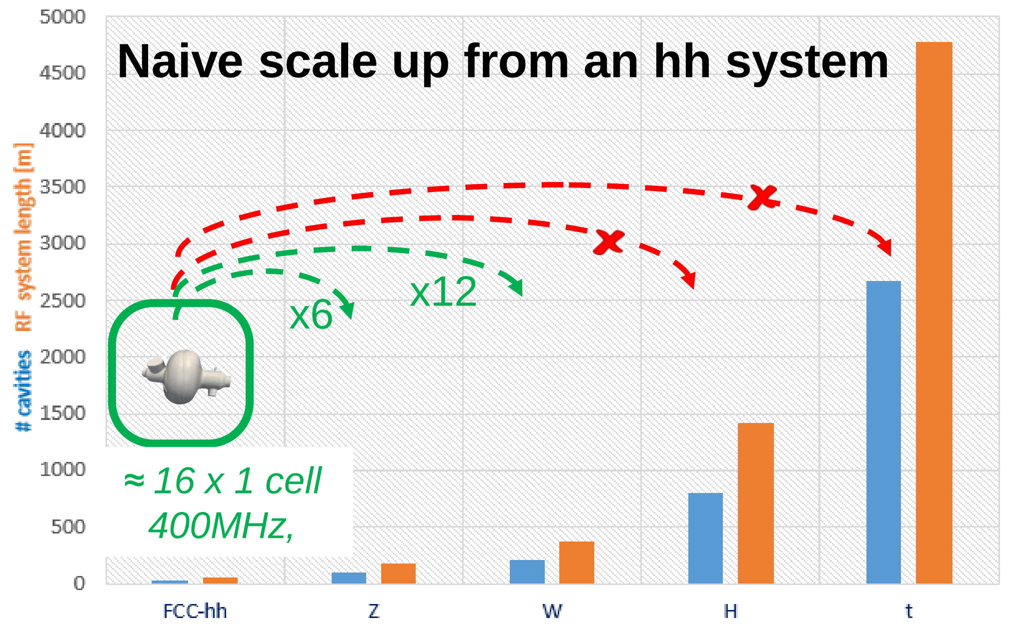
RF system requirements

Very large range of operation parameters

"Ampere-class" machines

	V_{total} GV	$n_{bunches}$	I_{beam} mA	ΔE/turn GeV
hh	0.032		**500**	
Z	0.4/0.2	30000/90000	**1450**	0.034
W	0.8	5162	152	0.33
H	**5.5**	770	30	1.67
t	**10**	78	6.6	7.55

"high gradient" machines

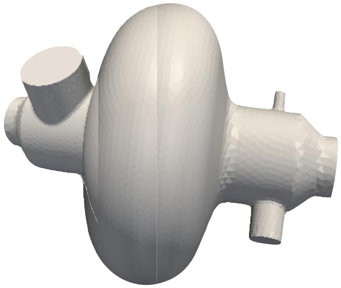


- **Voltage and beam current ranges span more than factor > 10^2**
- **No well-adapted single RF system solution satisfying requirements**

RF system R&D lines

400 MHz single-cell cavities preferred for hh and ee-Z (few MeV/m)

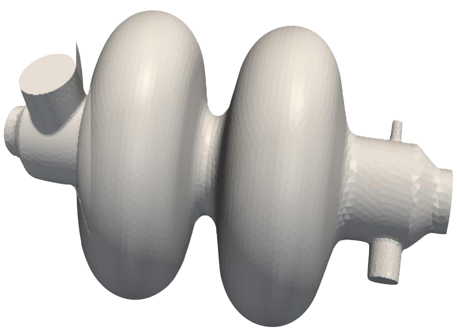
- Baseline Nb/Cu @4.5 K, development with synergies to HL-LHC, HE-LHC
- R&D: power coupling 1 MW/cell, HOM power handling (damper, cryomodule)



hh	Z	W
≈ 16 cells per beam	≈ 100 per beam	≈ 210 per beam
	(+ 100 for booster ring)	(+ 210 for booster ring)

400 or 800 MHz multi-cell cavities preferred for ee-H, ee-tt and ee-W

- Baseline options 400 MHz Nb/Cu @4.5 K, ◄—► 800 MHz bulk Nb system @2K
- R&D: High Q_0 cavities, coating, long-term: Nb_3Sn like components

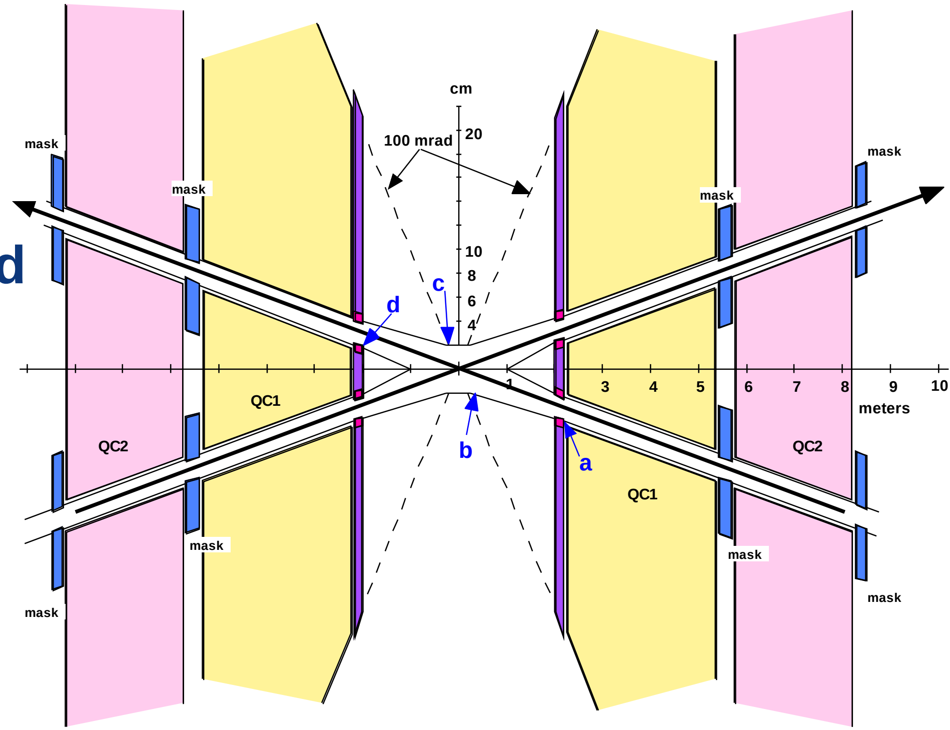


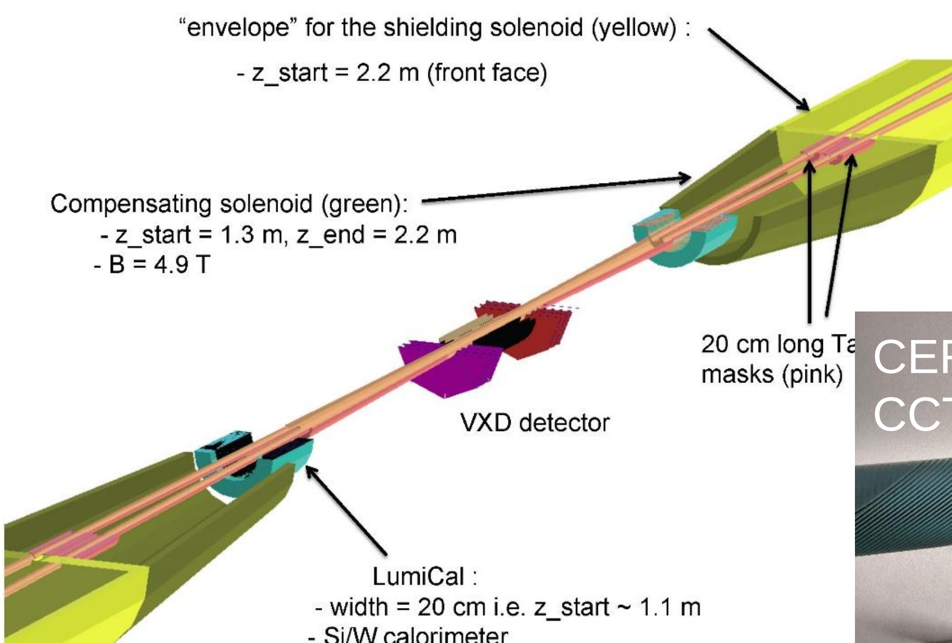
W	H	t
≈ 200 per beam	≈ 800 per beam	≈ common 2600 cells for both beams
(+ 200 for booster)	(+ 800 for booster)	(+ 2600 for booster)

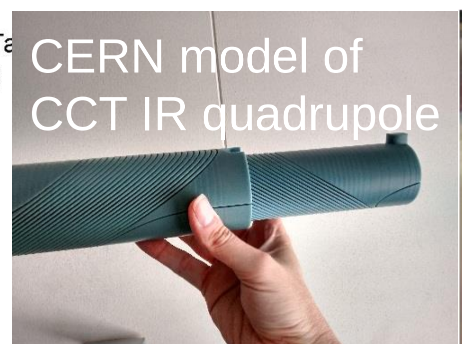
FCC-ee MDI optimisation

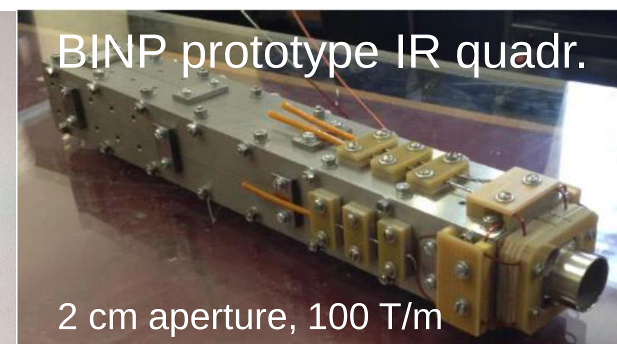
MDI work started with optimization of

- ***l****, **IR quadrupole design**
- **compensation & shielding solenoid**
- **SR masking and chamber layout**





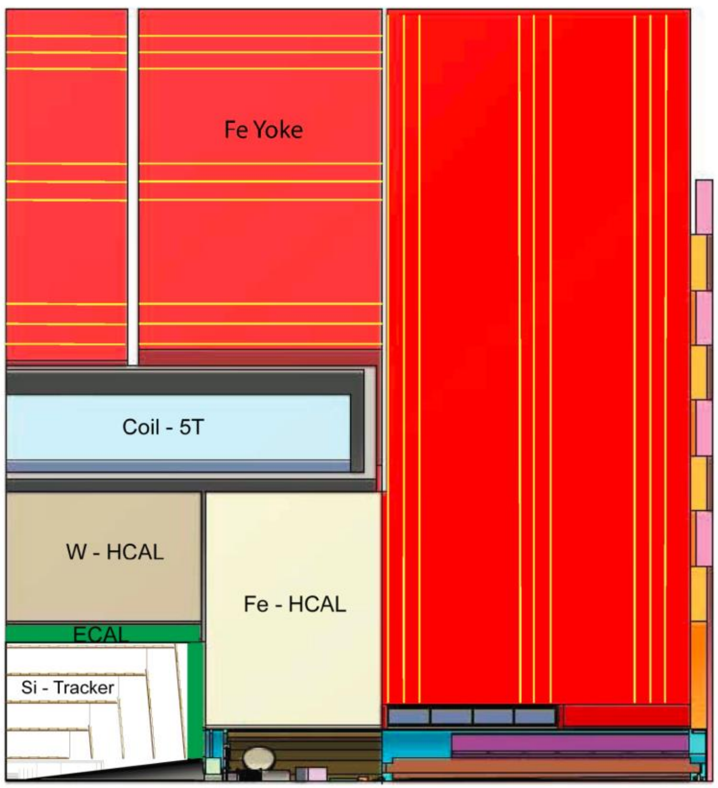




Design of FCC-ee Detectors

Adapted from ILC/CLIC detector: Experience with LEP detectors and ~20 years R&D for LC

CLIC - SiD



Some physics differences

-- Lower maximum energy 400GeV vs. >1000 GeV
➔ Momentum & energy resolution requirements
-- Higher statistics – need matching systematics

Some technical differences

-- High physics rate: 100 kHz Zs, must keep all.
-- No bunching ➔ cooling issues
-- better definition of beam energy and lower beam induced backgrounds

Exemple: Improved Higgs missing mass due to lower σ_{Ecm} @ FCC-ee ➔

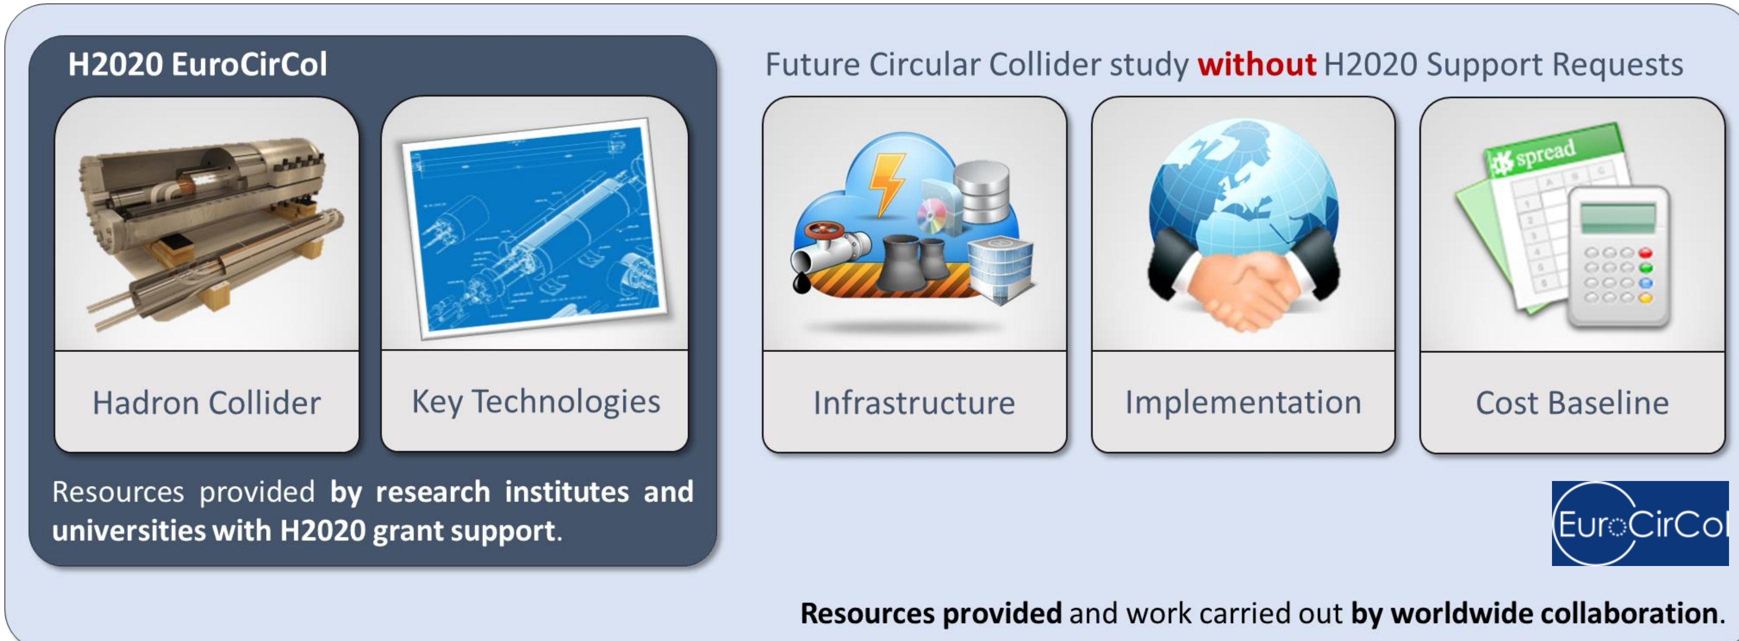
EuroCirCol EU Horizon 2020 Grant

EC contributes with funding to FCC-hh study

- Launched in June 2016, is in full swing now and makes essential contributions to the FCC-hh work packages:
- **Arc & IR optics design, 16 T dipole design, cryogenic beam vacuum system**
- **Recognition of FCC Study by European Commission.**



Summary study status

- Consolidated parameter sets for FCC-hh and FCC-ee machines
- Complete optics baselines for FCC-hh and FCC-ee, beam dynamics compatible with parameter requirements
- Common footprint for both accelerator options
- First round of geology and implementation CE and TI studies completed
- 6 reviews to confirm implementation, layout, optics, hh-injection & rf work

- Convergence on main MDI parameters
- Detector studies ongoing
- Framework available for physics and detector simulations
- FCC-hh physics report being published
- Technologies:
  - SC magnets, cryogenic beam vacuum and cryogenics programs well under way
  - RF, feedback, materials, protection, beam transfer, beam diagnostics moving into focus

Outlook 2016/17

- Further baseline improvement (insertions optimization, MDI optimization, power optimization, …)
- Launch HE-LHC conceptual design effort
- Functional specifications of elements for technical WPs and TI to enable conceptual design work
- Enforce technical infrastructure concepts, integration, installation, safety for machines & detectors
- Continue detector simulations, detector design work and definition of infrastructure requirements
- Development of TDR and construction schedules as basis for cost estimates and governance models
- Study review at FCCW 2017, to freeze baselines

The FCC Week 2016 should:

- Stimulate exchange between participants of all study areas
- Strengthen the collaboration network
- Allow fruitful discussions to develop solutions for our common goals
- Have a Great Week!
