Python and PostgreSQL - a match made in heaven

Monday, 3 July 2006 11:00 (30 minutes)

PostgreSQL is a heavenly match to Python. Both share the same kind of licence, both have an excellent community, both work perfectly together.

I will destroy bad PostgreSQL myths, give an overview of using PostgreSQL to interface with Python, and as a special feature show how to use Python inside PostgreSQL to write stored procedures.

The business aspect, the possibilites of rollout and also the availability on the main platforms will be discussed.
