## Come on and plug me in! Writing and testing plugins for Bazaar

*Wednesday 5 July 2006 11:35 (1h 5m)*

Bazaar is a revision control system written entirely in Python. Programmers can use Bazaar's plugin system to provide new options, features and facilities. We demonstrate writing a plugin for Bazaar and describe what having a plugin system has done to and for Bazaar.

### Summary

Bazaar has a nice flexible plugin system that allows extension of Bazaar in a convenient fashion. Plugins need to fit seamlessly into the core program, yet are often developed and shipped separately. In this talk David Allouche will demonstrate Bazaar, some of the existing plugins for Bazaar, and show how to write a plugin. Robert Collins will talk about the plugin system, what we wanted to achieve with it, what it has done to and for Bazaar.
