Source code management for a distributed team.

Monday 3 July 2006 15:10 (30 minutes)

One way to manage the source code flow for medium size projects with distributed teams. Canonical manages the source code for its Launchpad project using bazaar. Launchpad has 15 developers spread over 5 continents who primarily work from home. We demonstrate how a feature goes from being just an idea through development, code review and finally being committed to the official source code tree after it passes our regression test suite.
