CPSSkins: theme editor for Zope3

Tuesday, 4 July 2006 14:35 (30 minutes)

CPSSkins is an application that allows site designers to compose pages by selecting and arranging UI elements on a canvas without having to use a programming language.

This talk goes through the new exciting features found in the upcoming zope3 version of the application such as:

- the new AJAX-based user interface
- the WYSIWYG style editor
- a simple API for creating custom portlets and widgets
- the use of "perspectives" to control the visibility of elements on a page
- the ability to create sites through-the-web and on the file-system
- the XML import/export facility
- the highly modular rendering engine
- compatibility with Zope2/Five
- ...

The talk is targeted towards both developers and site designers.

More information about CPSSkins can be found at http://www.z3lab.org
