Highlights and Prospects from LHCb

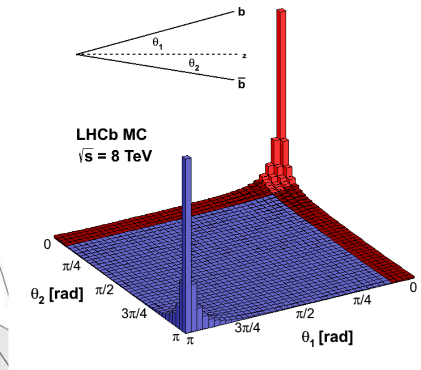
Tim Gershon
University of Warwick

NPKI 2016

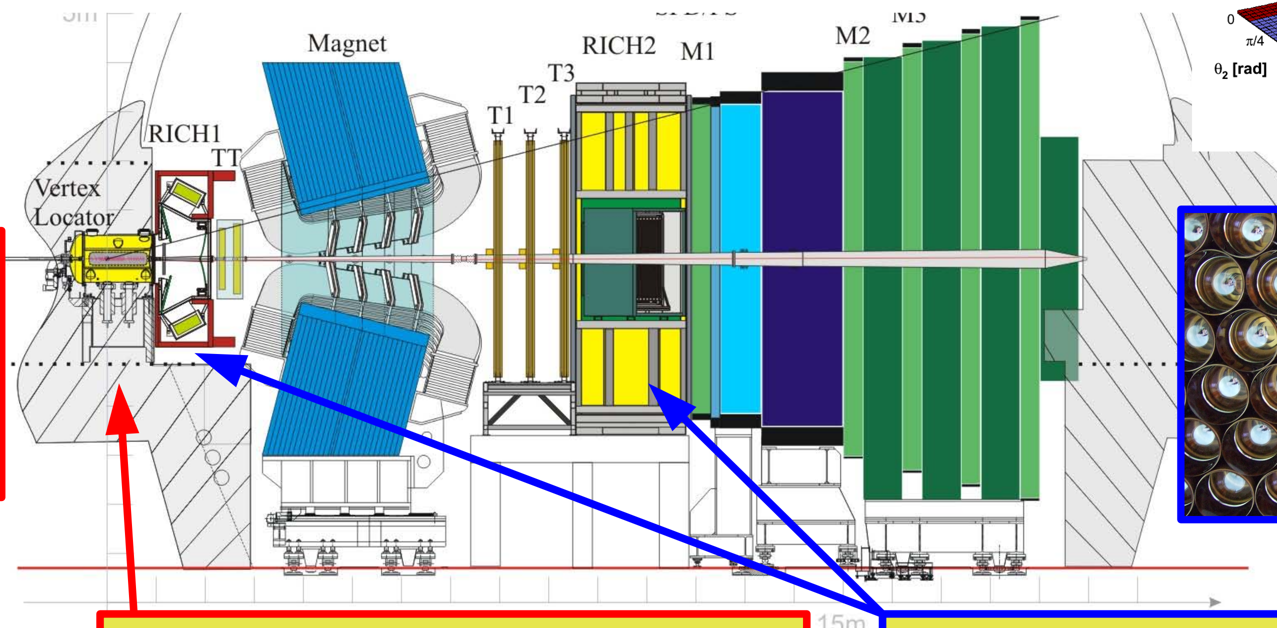
15th June 2016

The LHCb detector

- In high energy collisions, $b\bar{b}$ pairs produced predominantly in forward or backward directions
- LHCb designed as a forward spectrometer



The LHCb Detector
JINST 3 (2008) S08005



Precision primary and secondary vertex measurements

Excellent K/π separation capability

The LHCb Run 1 trigger

JINST 8 (2013) P04022

Challenge is

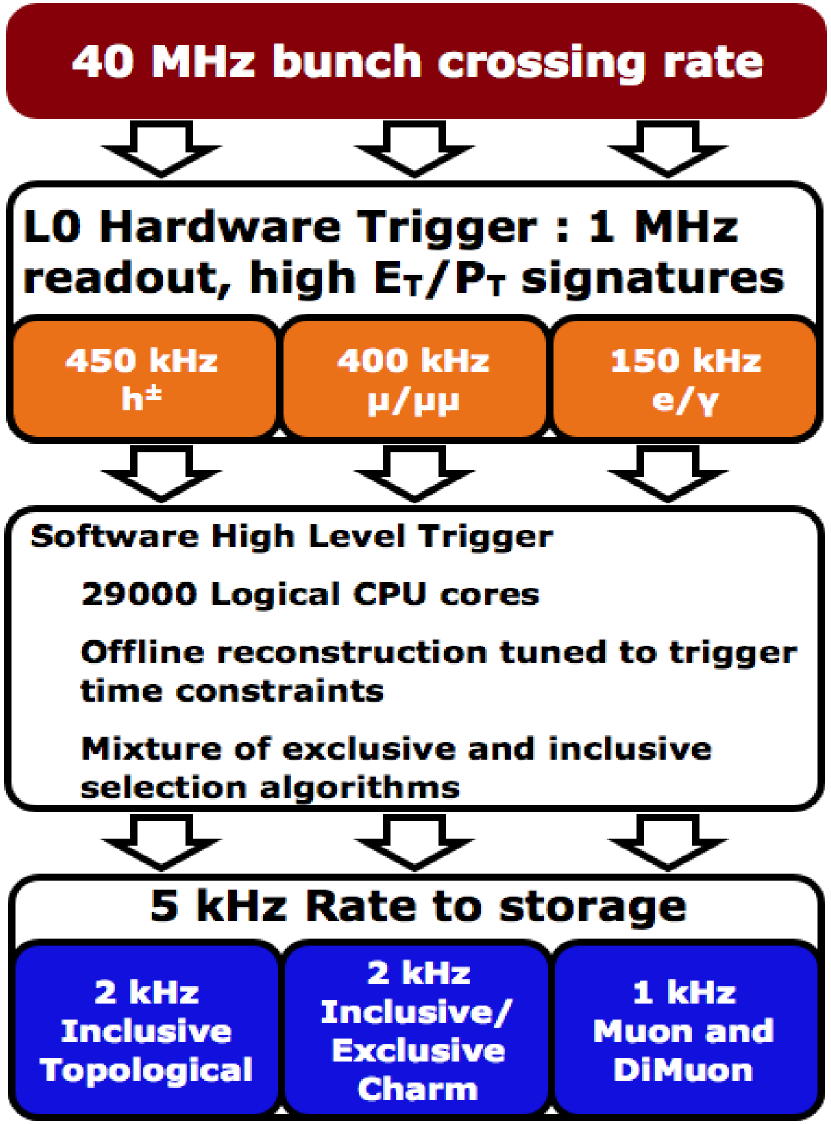
- to efficiently select most interesting events
- while maintaining manageable data rates

Main backgrounds

- "minimum bias" inelastic pp scattering
- other charm and beauty decays

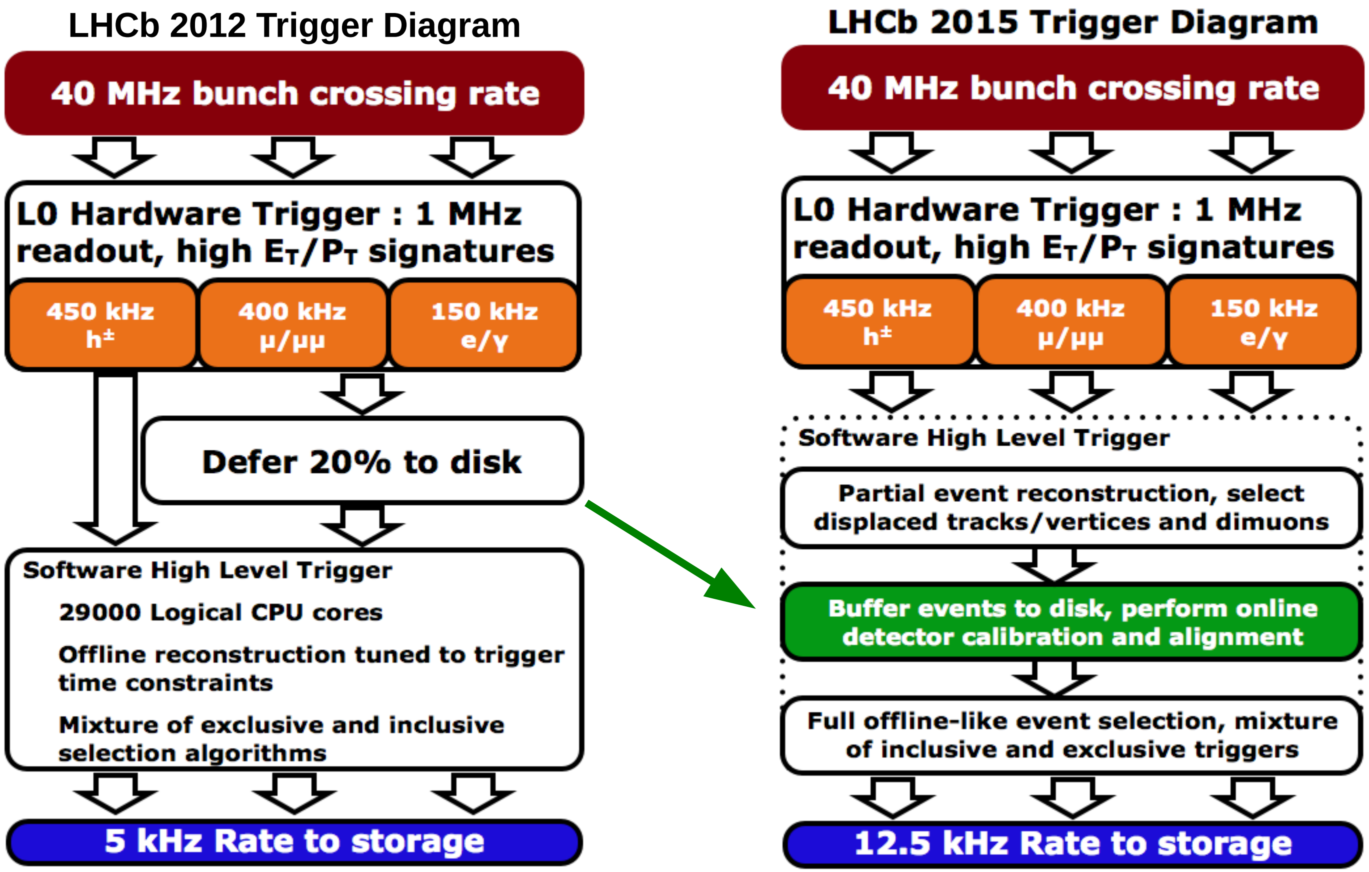
Handles

- high p_T signals (muons)
- displaced vertices



Run II data taking

- At 13 TeV, LHCb's flavour physics programme gains from higher √s (increased production) and 25 ns bunch spacing (lower pile up)
- During LS1: some subdetector consolidation; new HERSCHEL forward shower counters; change of data flow in trigger

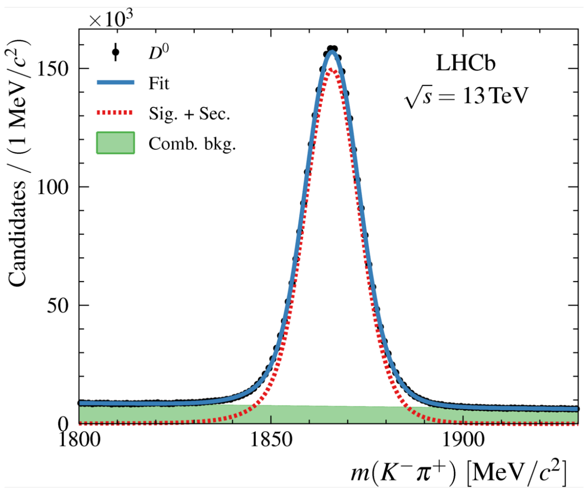


First results from Run II

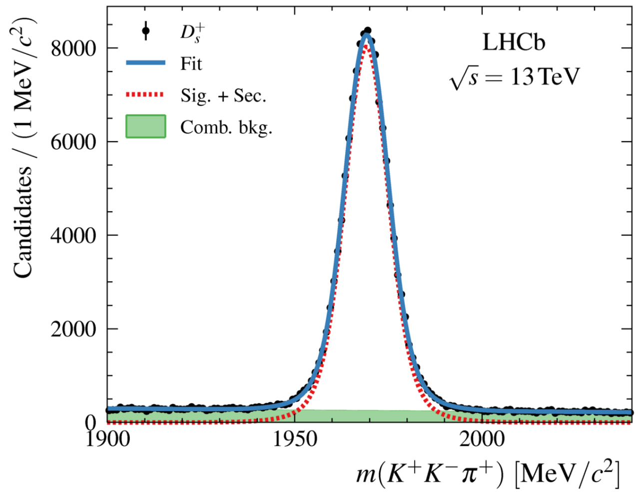
Open charm production

JHEP 03 (2016) 159

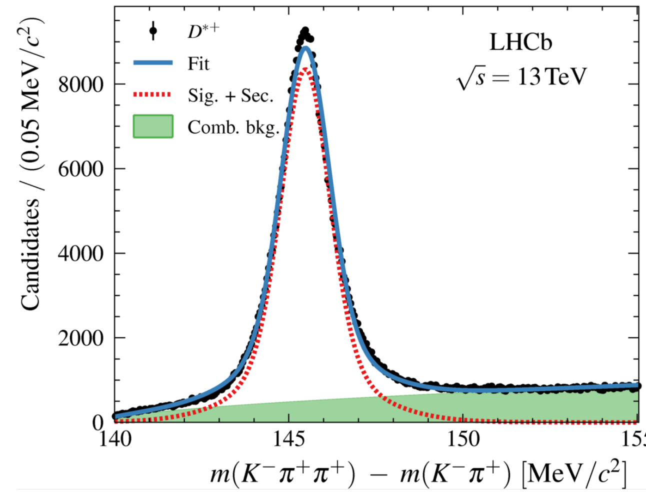
D → Kπ



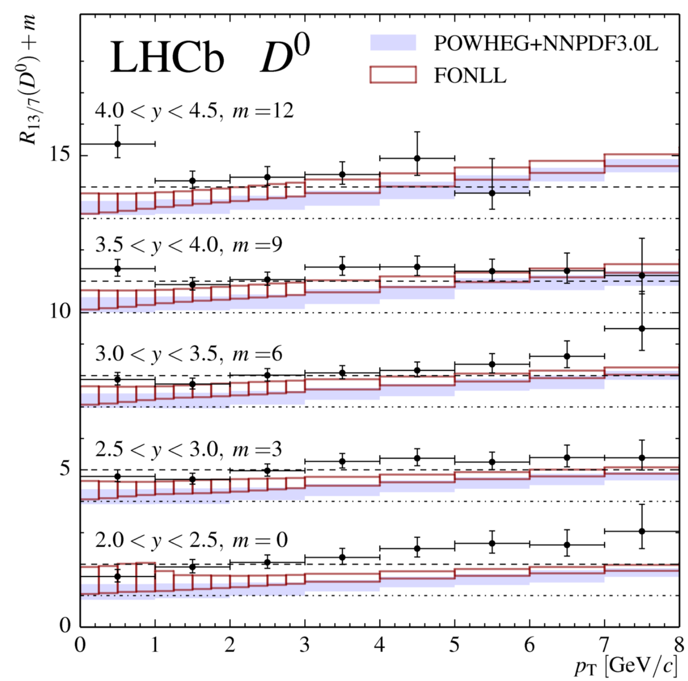
D_s → KKπ



D* → Dπ; D → Kπ



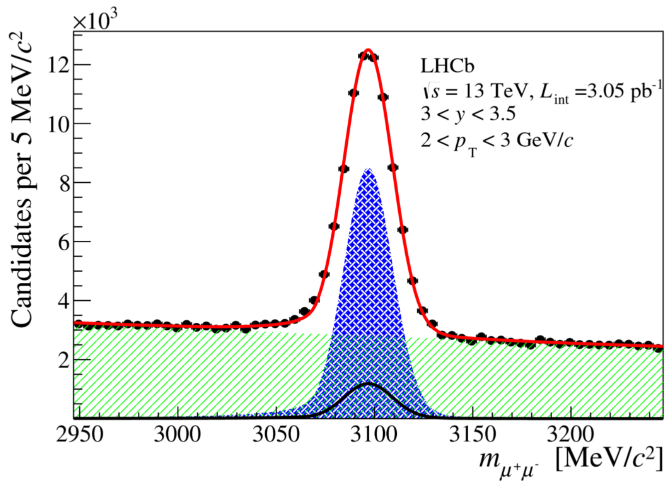
Increases of production cross-section from √s = 7 → 13 TeV at upper end of range of expectation

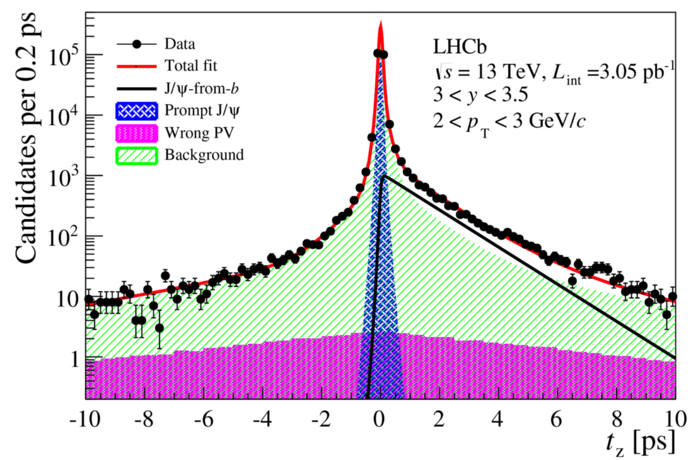


First results from Run II

J/ψ production

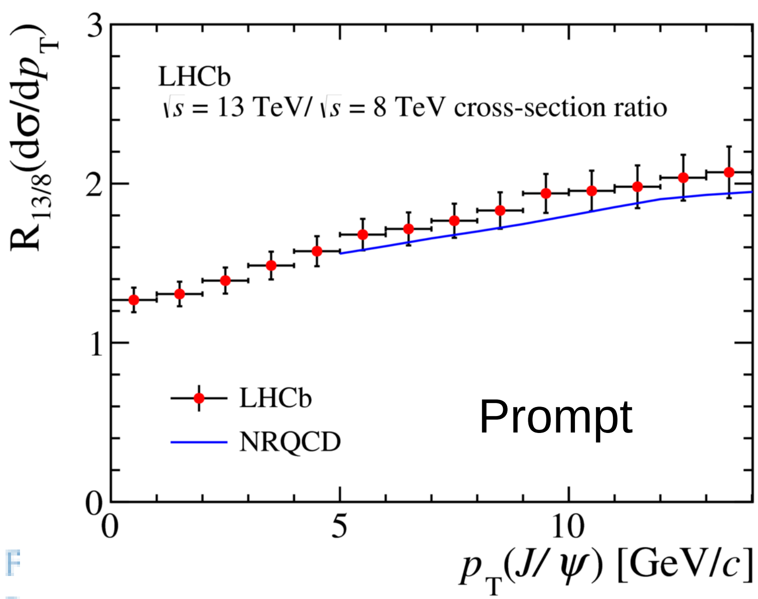
JHEP 10 (2015) 172

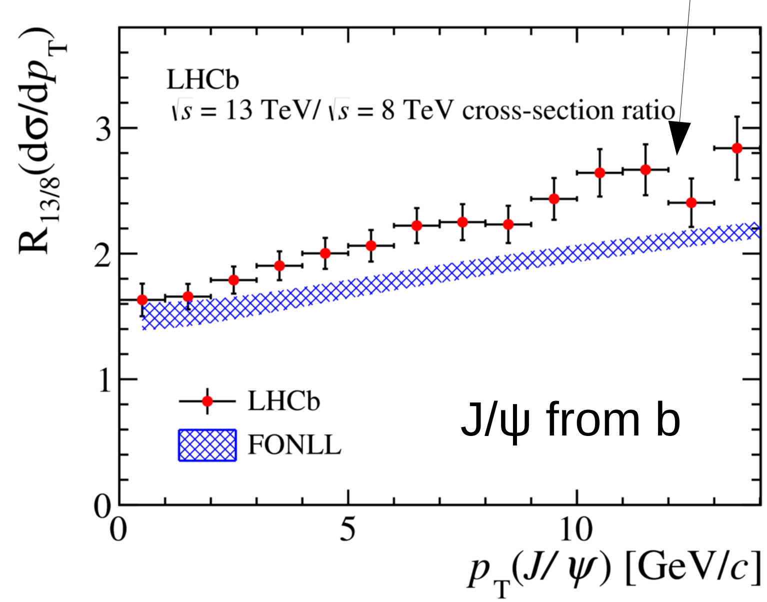




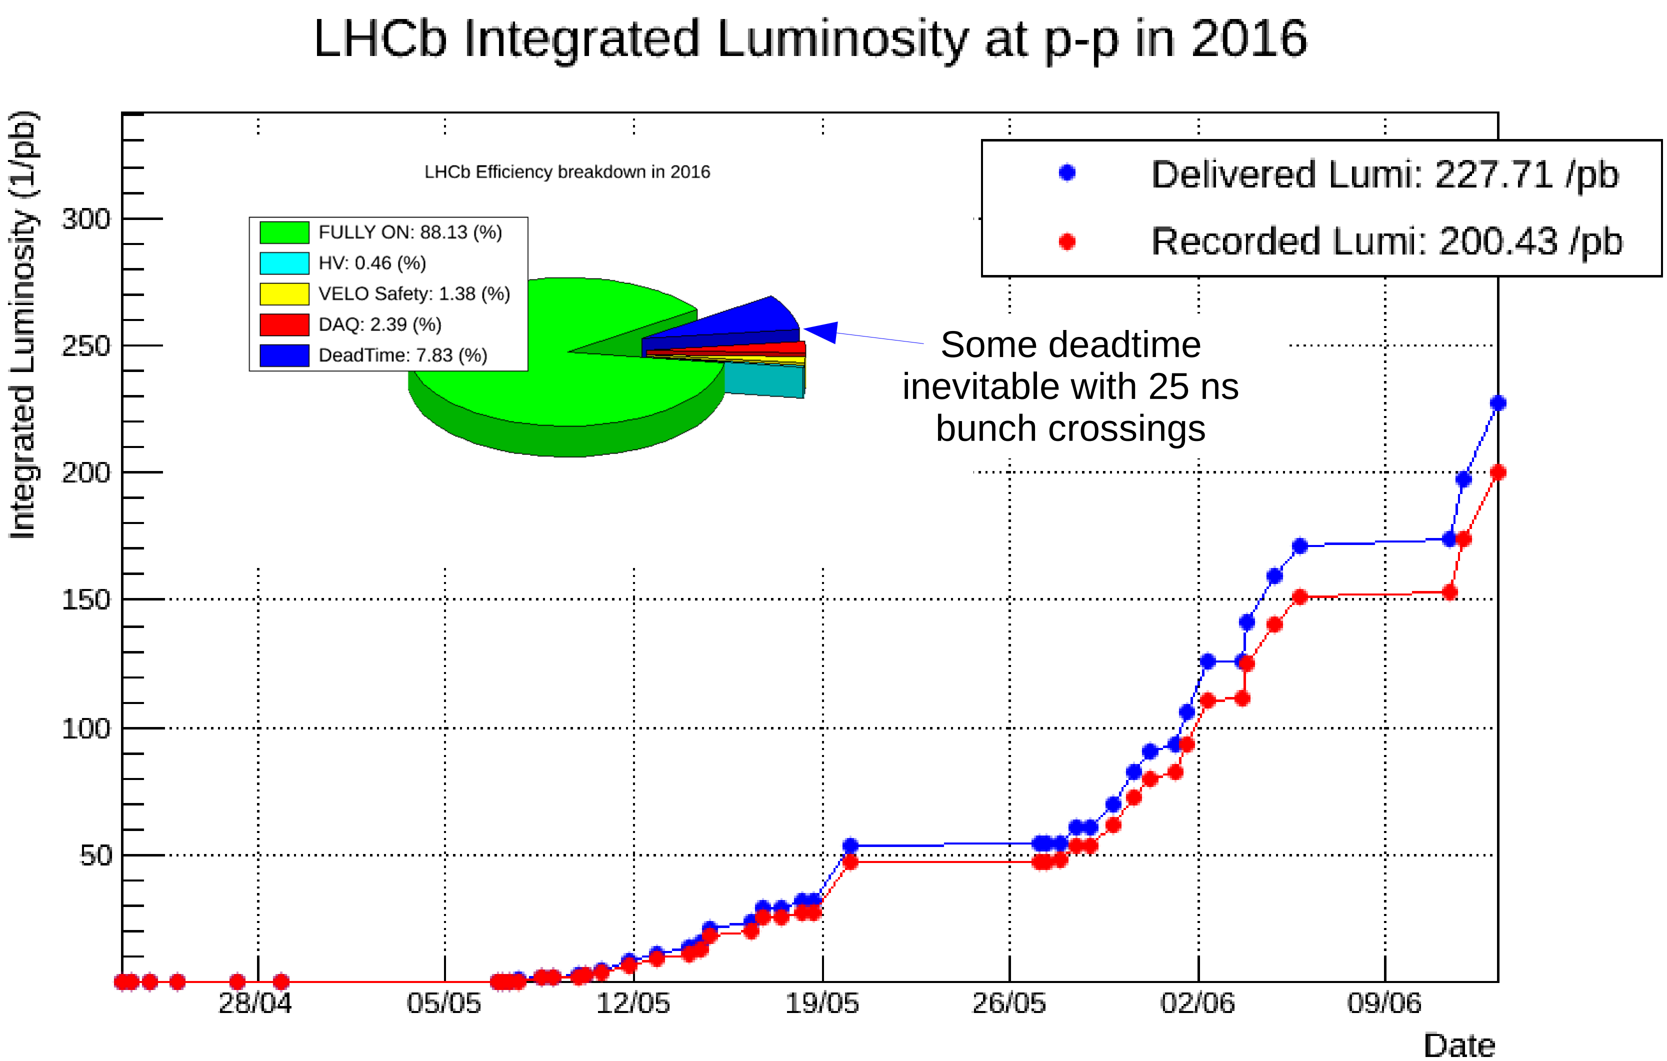
high-p_T b-hadrons tend to have lower background & better tagging

Increases from √s = 7,8 → 13 TeV at upper end of range of expectation





Data taken so far in Run II



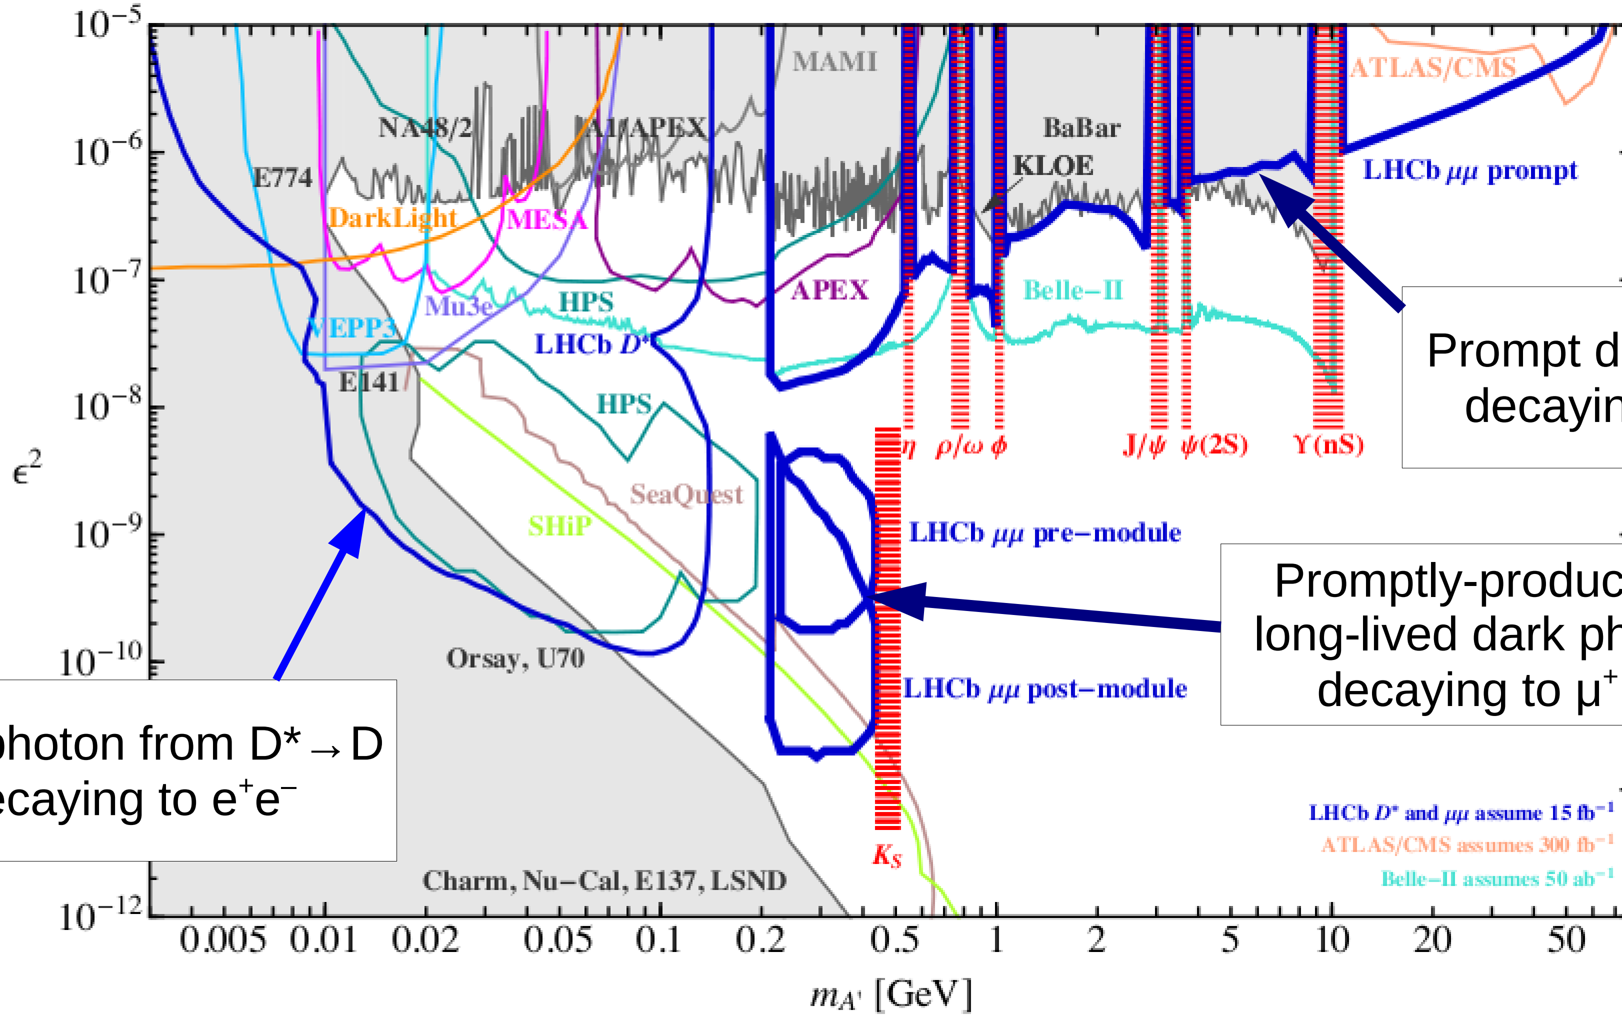
c.f. 1/fb in 2011 @ 7 TeV; 2/fb in 2012 @ 8 TeV
0.2/fb in 2015 @ 13 TeV

Not only flavour physics ...

- Most of the recent results from LHCb are on its “core” flavour physics programme
  - CP violation, the Unitarity Triangle and rare B decays
- LHCb also has unique non-flavour capability
  - Top production in the forward region (PRL 115 (2015) 112001)
  - Determination of $\sin^2\theta_W$ (JHEP 11 (2015) 190)
  - Search for hidden sector bosons (PRL 115 (2015) 161802)
  - Ideas to search for dark photons ...

Proposals for dark photon searches at LHCb

arXiv:1509.06765, arXiv:1603.08926



Prompt dark photon decaying to $\mu^+\mu^-$

Promptly-produced, long-lived dark photon decaying to $\mu^+\mu^-$

Dark photon from $D^* \rightarrow D$ decaying to e^+e^-

CP violation & the Unitarity Triangle

The Unitarity Triangle

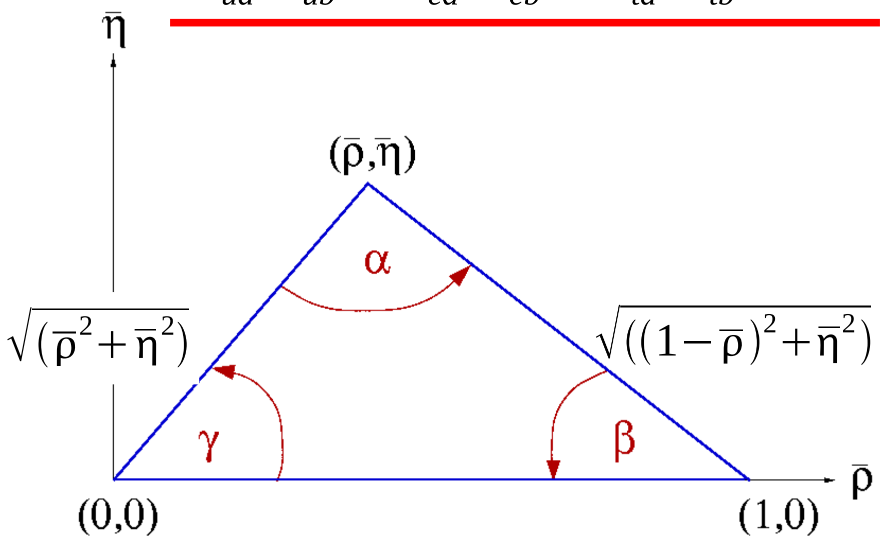
- The CKM matrix must be unitary

$$V_{CKM}^{+} V_{CKM} = V_{CKM} V_{CKM}^{+} = 1$$

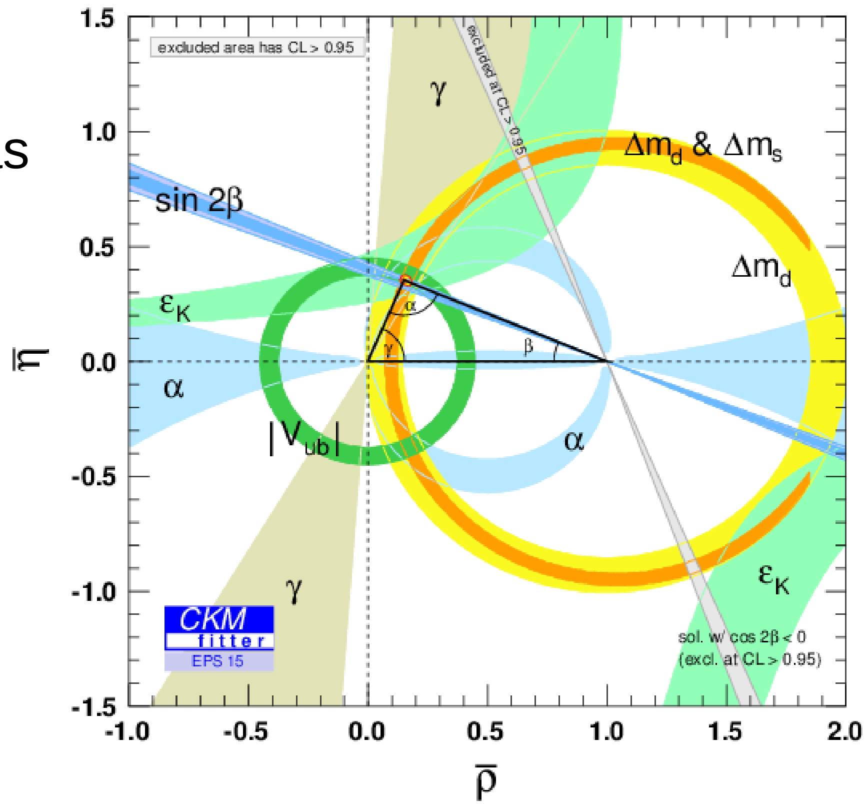
- Provides numerous tests of constraints between independent observables, such as

$$|V_{ud}|^2 + |V_{us}|^2 + |V_{ub}|^2 = 1$$

$$V_{ud} V_{ub}^{*} + V_{cd} V_{cb}^{*} + V_{td} V_{tb}^{*} = 0$$



http://ckmfitter.in2p3.fr
see also http://www.utfit.org



Consistency of measurements tests the Standard Model and provides model-independent constraints on New Physics

$|V_{ub}/V_{cb}|$ from $\Lambda_b \to p\mu\nu / \Lambda_b \to \Lambda_c\mu\nu$

Nature Phys. 11 (2015) 743

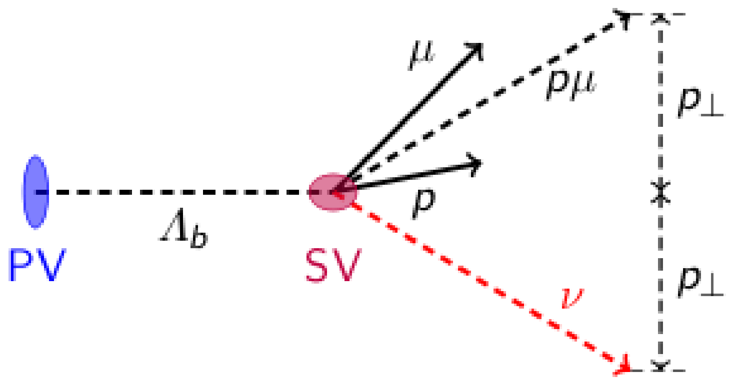
- Long standing discrepancy between exclusive and inclusive determinations of both V_{ub} and V_{cb}

PDG 2014

$$|V_{cb}| = (42.4 \pm 0.9) \times 10^{-3} \text{ (inclusive)} \qquad |V_{ub}| = (4.41 \pm 0.15 \, ^{+\,0.15}_{-\,0.17}) \times 10^{-3} \quad \text{(inclusive)},$$
$$|V_{cb}| = (39.5 \pm 0.8) \times 10^{-3} \text{ (exclusive)} \qquad |V_{ub}| = (3.23 \pm 0.31) \times 10^{-3} \quad \text{(exclusive)}.$$

- Use of b baryon decays provides complementary alternative to B mesons
- At LHCb, exploit displaced vertex to reconstruct corrected mass

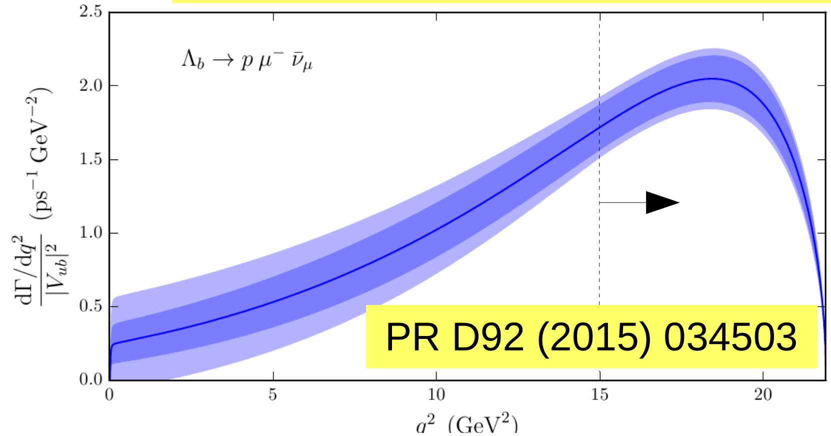
$$M_{corr} = \sqrt{p_\perp^2 + M_{p\mu}^2} + p_\perp$$



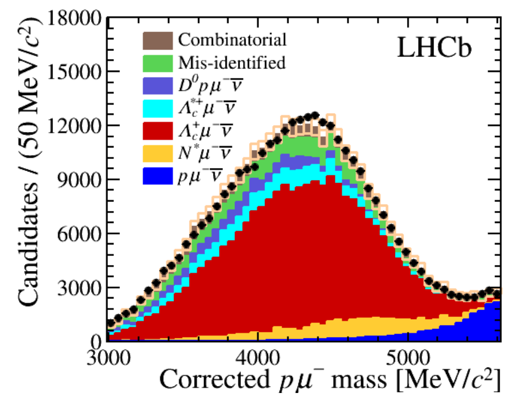
$|V_{ub}/V_{cb}|$ from $\Lambda_b \to p\mu\nu / \Lambda_b \to \Lambda_c\mu\nu$

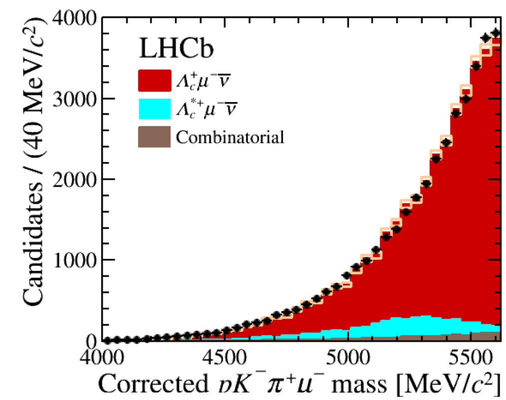
Nature Phys. 11 (2015) 743

- Can then reconstruct $q^2 = m(\mu\nu)^2$
  - Select events with $q^2 > 15$ GeV^2
  - Highest rate, best resolution & most reliable theory (lattice) predictions
- Use isolation MVA to suppress background
- Fit M_{corr} to obtain signal yields



PR D92 (2015) 034503





- Rules out models with RH currents
- Compatible with UT fit (β,γ)

$$\frac{\mathcal{B}(\Lambda_b \to p\mu^-\overline{\nu}_\mu)_{q^2>15\,\mathrm{GeV}^2/c^4}}{\mathcal{B}(\Lambda_b \to \Lambda_c\mu\nu)_{q^2>7\,\mathrm{GeV}^2/c^4}} = (1.00 \pm 0.04(stat) \pm 0.08(syst)) \times 10^{-2}$$

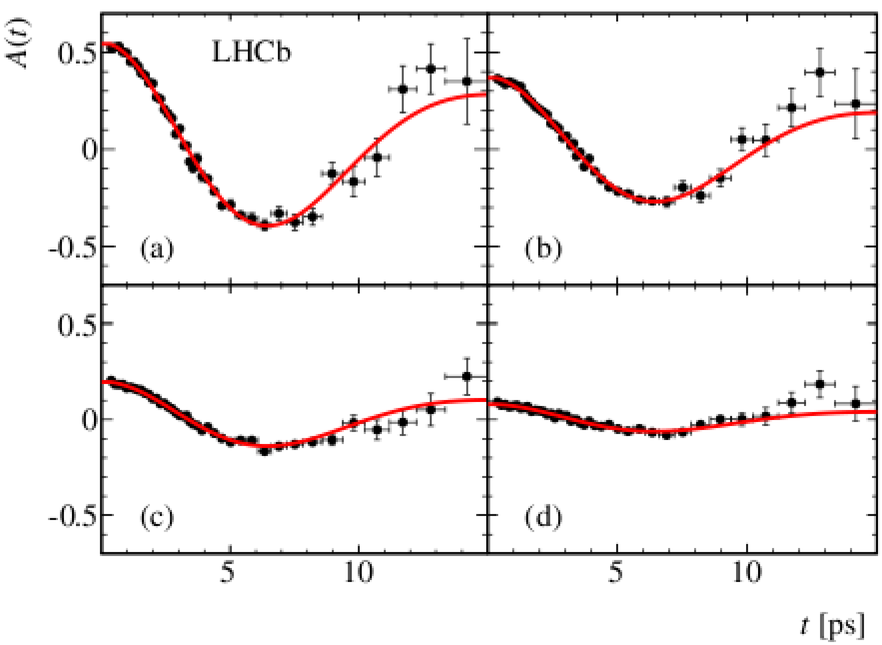
$$\frac{|V_{ub}|}{|V_{cb}|} = 0.083 \pm 0.004(\mathrm{expt}) \pm 0.004(\mathrm{lattice})$$

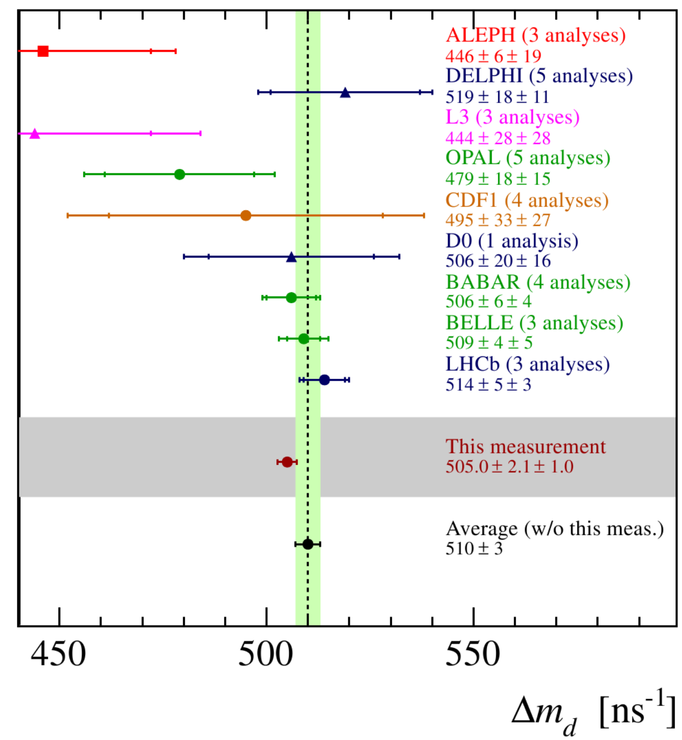
$|V_{td}/V_{ts}|$ from $\Delta m_d/\Delta m_s$

arXiv:1604.03475

$\Delta m_s = 17.768 \pm 0.023 \pm 0.006\ \mathrm{ps}^{-1}$ (LHCb NJP 15 (2013) 053021)
latest lattice calculations: arXiv:1603.04306, arXiv:1602.03560

- Δm_s now precisely known
- limitation on knowledge of UT side from lattice (improving fast) and Δm_d
- new measurement uses $B^0 \to D^{(*)-}\mu\nu$ decays





$\Delta m_d = (505.0 \pm 2.1\ \text{(stat)} \pm 1.0\ \text{(syst)})\ \mathrm{ns}^{-1}$

single most precise determination
precision of previous world average

only 2012 $B^0 \to D^-\mu\nu$
data shown

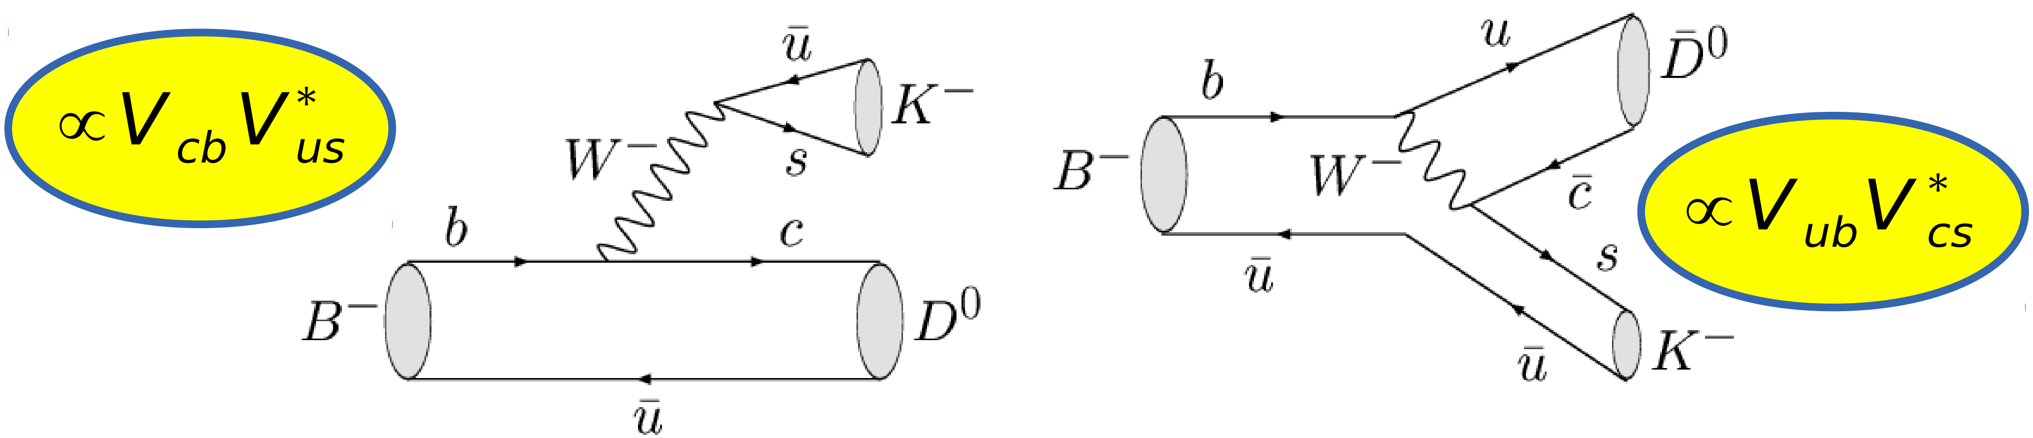
Importance of γ from B→DK

- γ plays a unique role in flavour physics

the only CP violating parameter that can be measured through tree decays (*)

(*) more-or-less

- A benchmark Standard Model reference point
  - doubly important after New Physics is observed

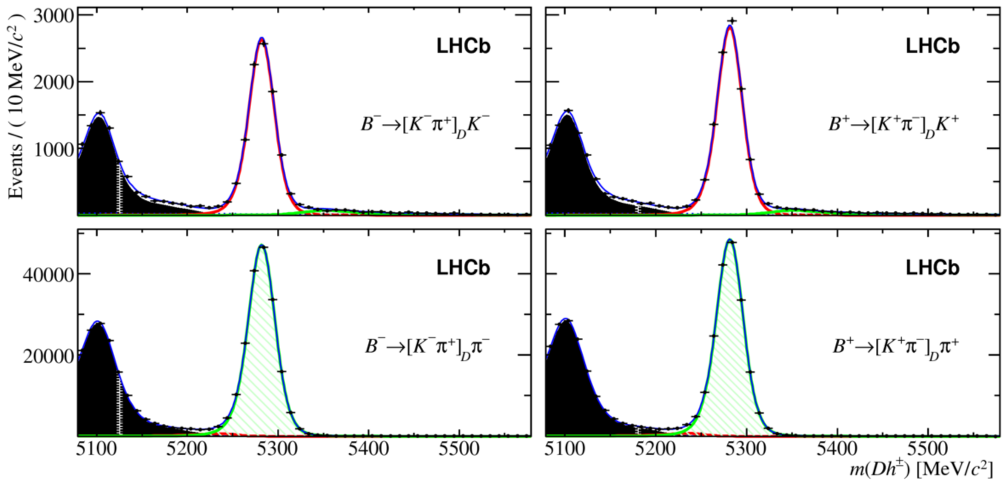


Variants use different B or D decays
require a final state common to both D^0 and $\overline{D}^0$

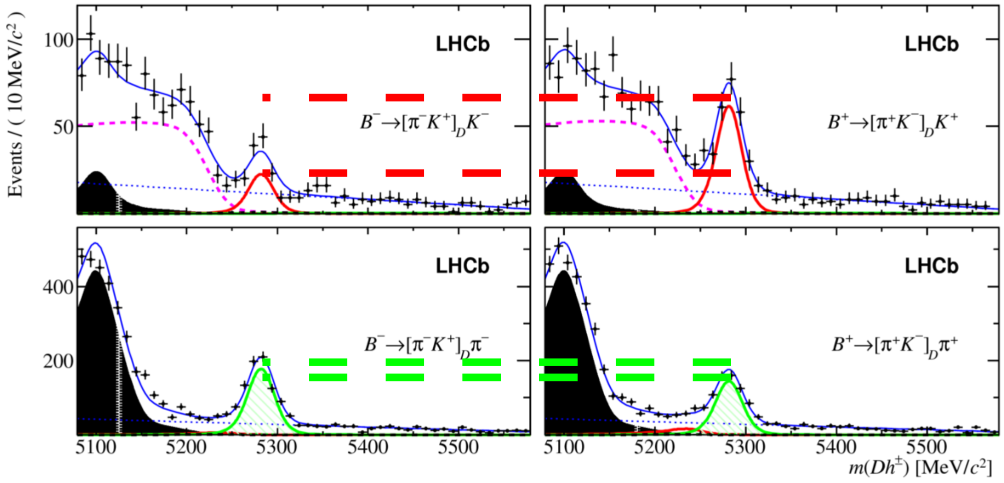
γ from $B^+ \to DK^+$, $D \to KK,\pi\pi$, $K\pi$

arXiv:1603.08993

$D \to K\pi$ (favoured)



$D \to \pi K$ (“ADS” suppressed)



small asymmetries due to production and detection effects

$B \to D\pi$ control mode helps to separate effects

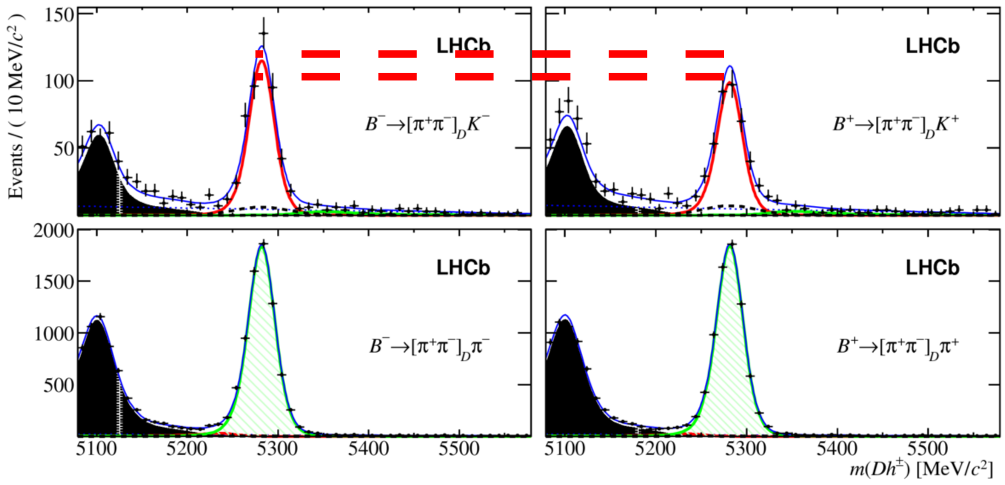
large CP violating asymmetries – first 5σ observation in a single $B \to DK$ channel

effects also possible in $B \to D\pi$

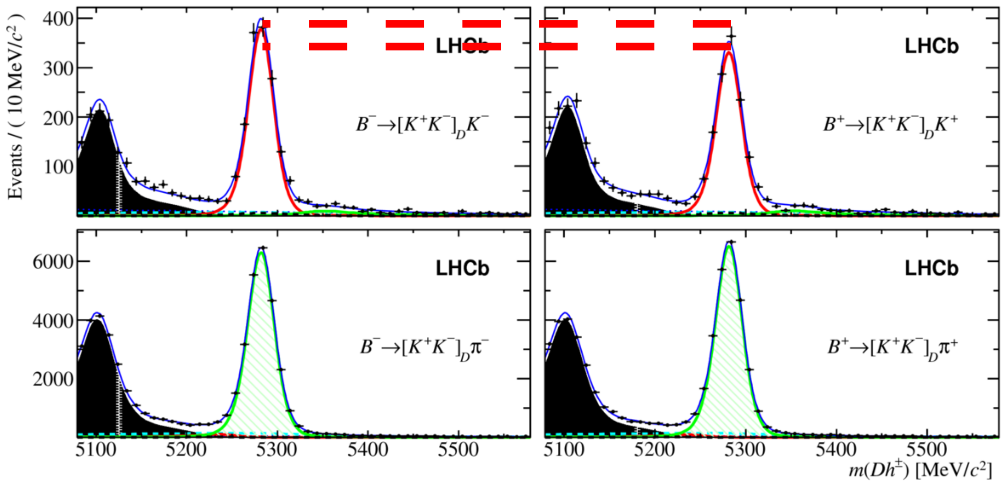
γ from $B^+ \to DK^+$, $D \to KK, \pi\pi, K\pi$

arXiv:1603.08993

$D \to \pi\pi$ (“GLW” CP+ state)



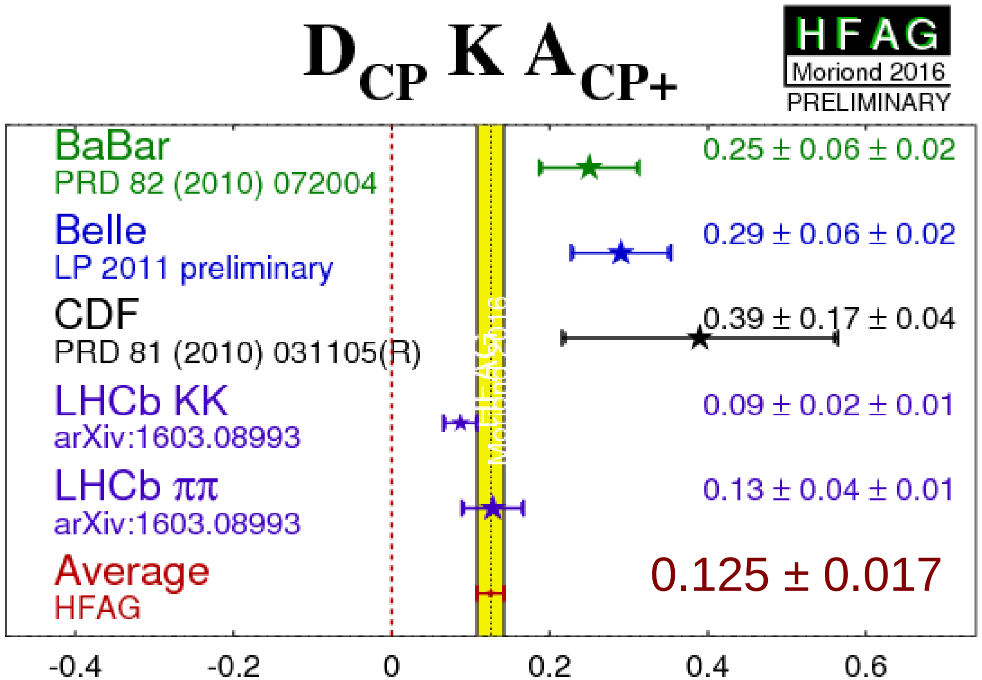
$D \to KK$ (“GLW” CP+ state)

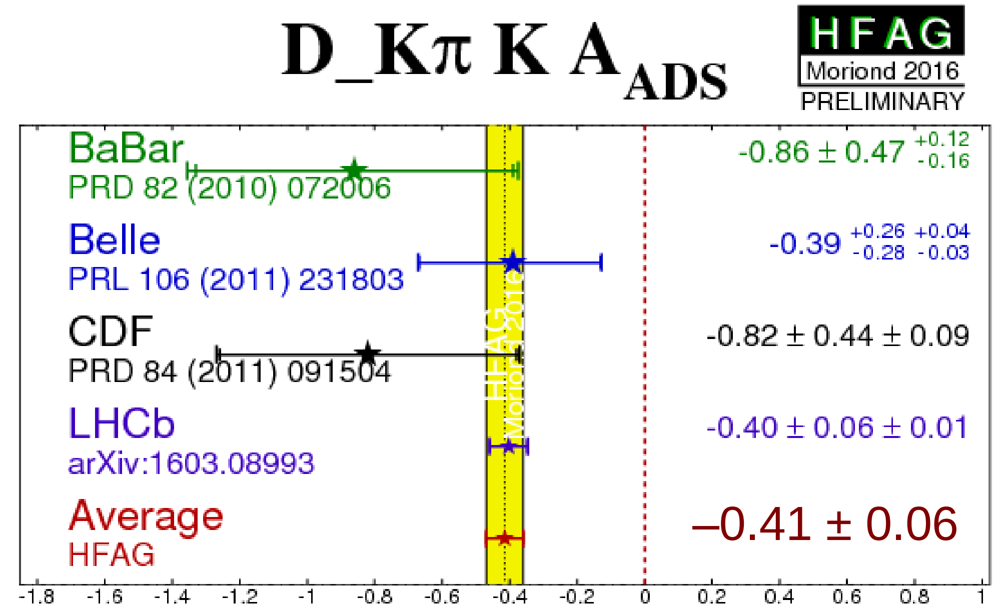


CP violating asymmetries visible
but not 5σ significant

γ from $B^+ \to DK^+$, $D \to KK, \pi\pi$, $K\pi$

arXiv:1603.08993





Measurements reaching percent level precision

Some tension in the A_{CP+} average (χ^2 = 16/4 dof) but no other sign of experimental disagreements

γ from $B^0 \to DK^{*0}$, $D \to K_S\pi\pi$, K_SKK

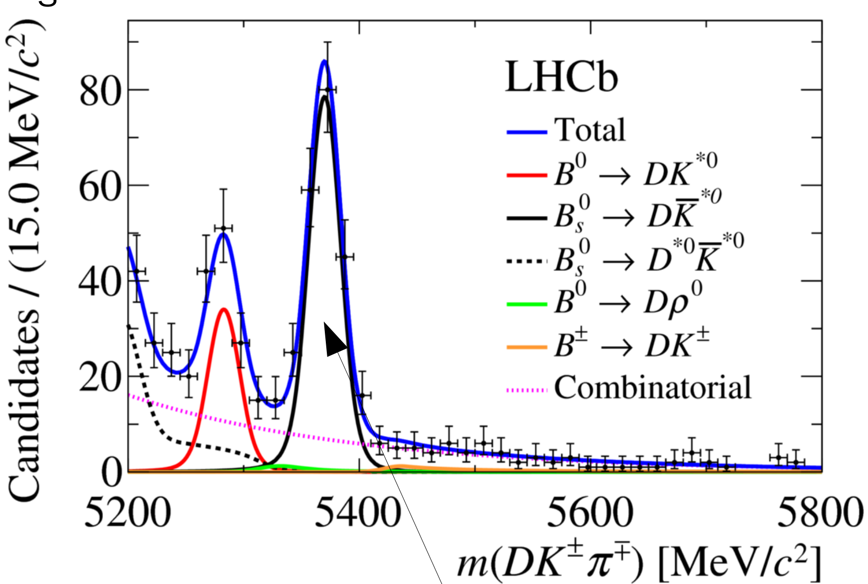
arXiv:1604.01525, arXiv:1605.01082

$B^0 \to DK^{*0}$ rarer, but with larger interference effects, than $B^+ \to DK^+$

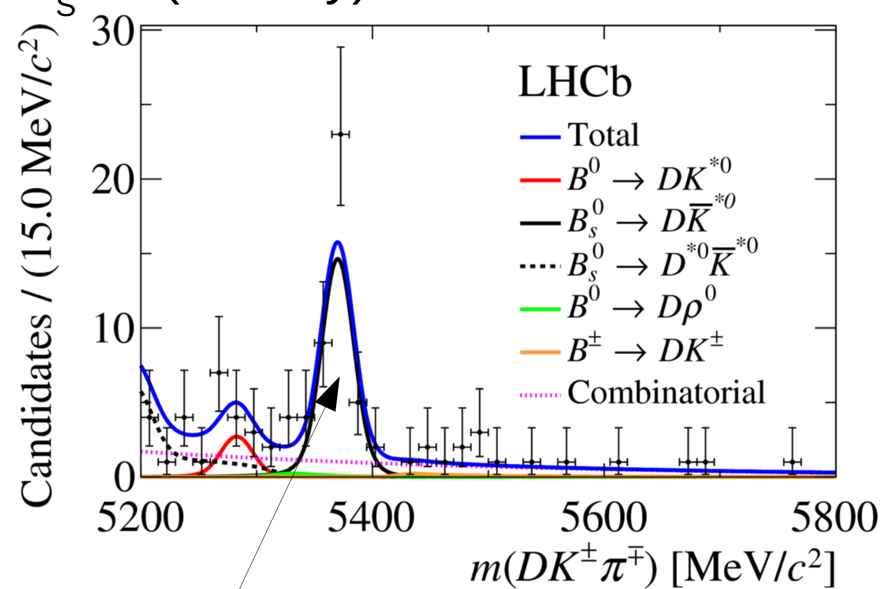
$D \to KK$, $\pi\pi$, $K\pi$ previously studied in PR D90 (2014) 112002

Now consider “GGSZ” modes with both model-independent (arXiv:1604.01525) and -dependent (arXiv:1605.01082) analyses

$D \to K_S\pi\pi$ (both MI & MD)



$D \to K_SKK$ (MI only)



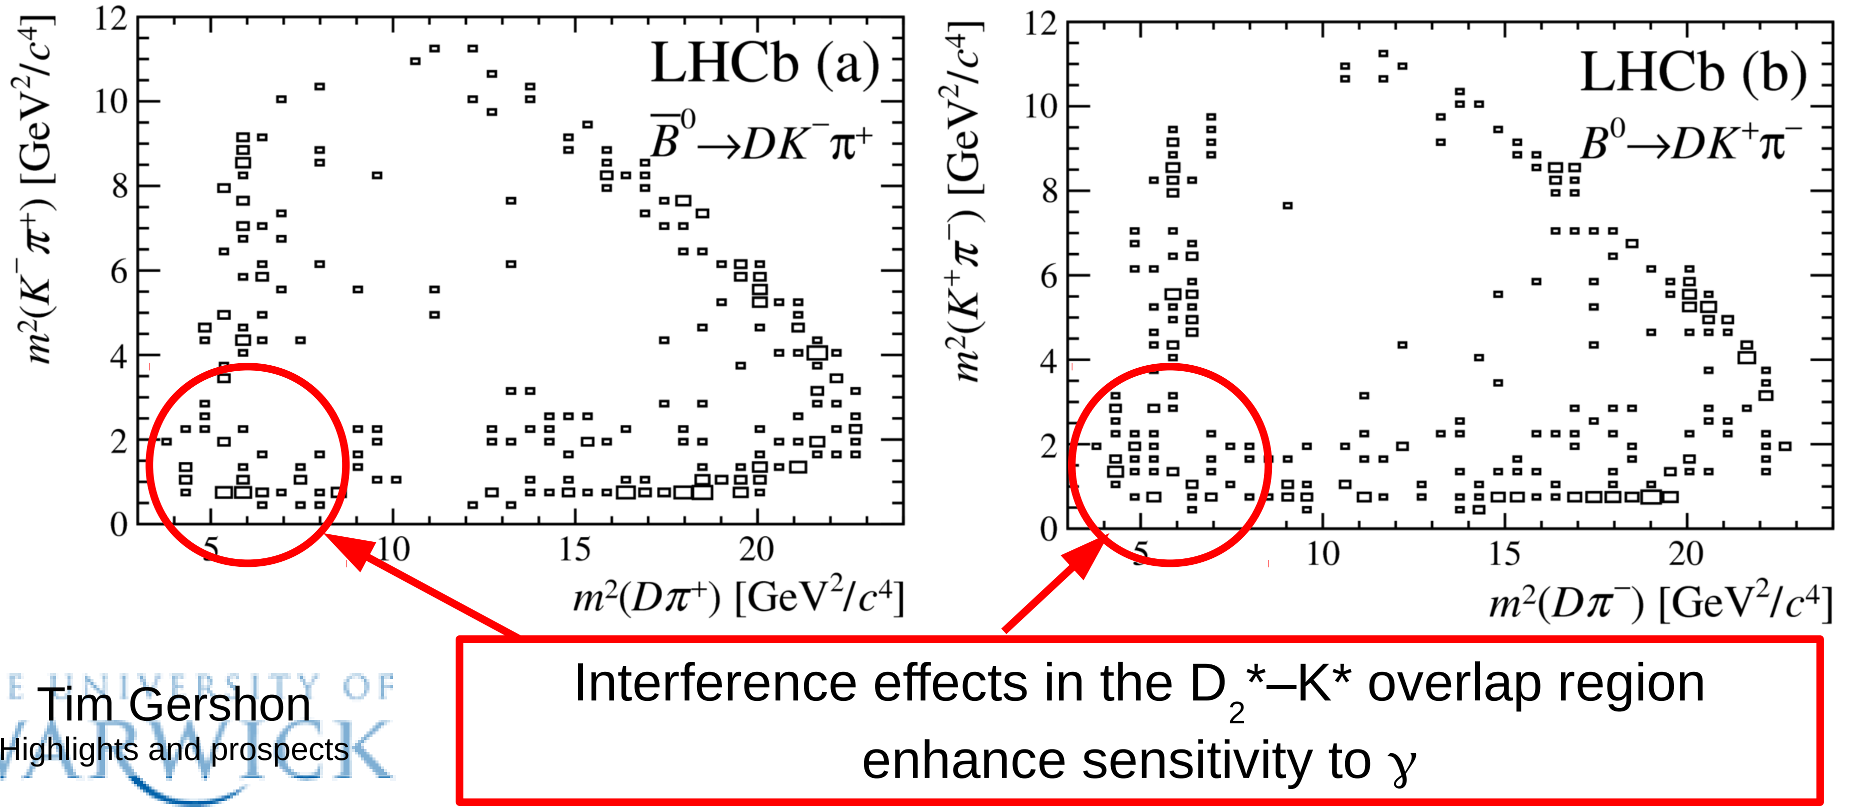
B_s^0 decays to same final states provide control channels

γ from $B^0 \to DK^{*0}$

arXiv:1604.01525, arXiv:1605.01082

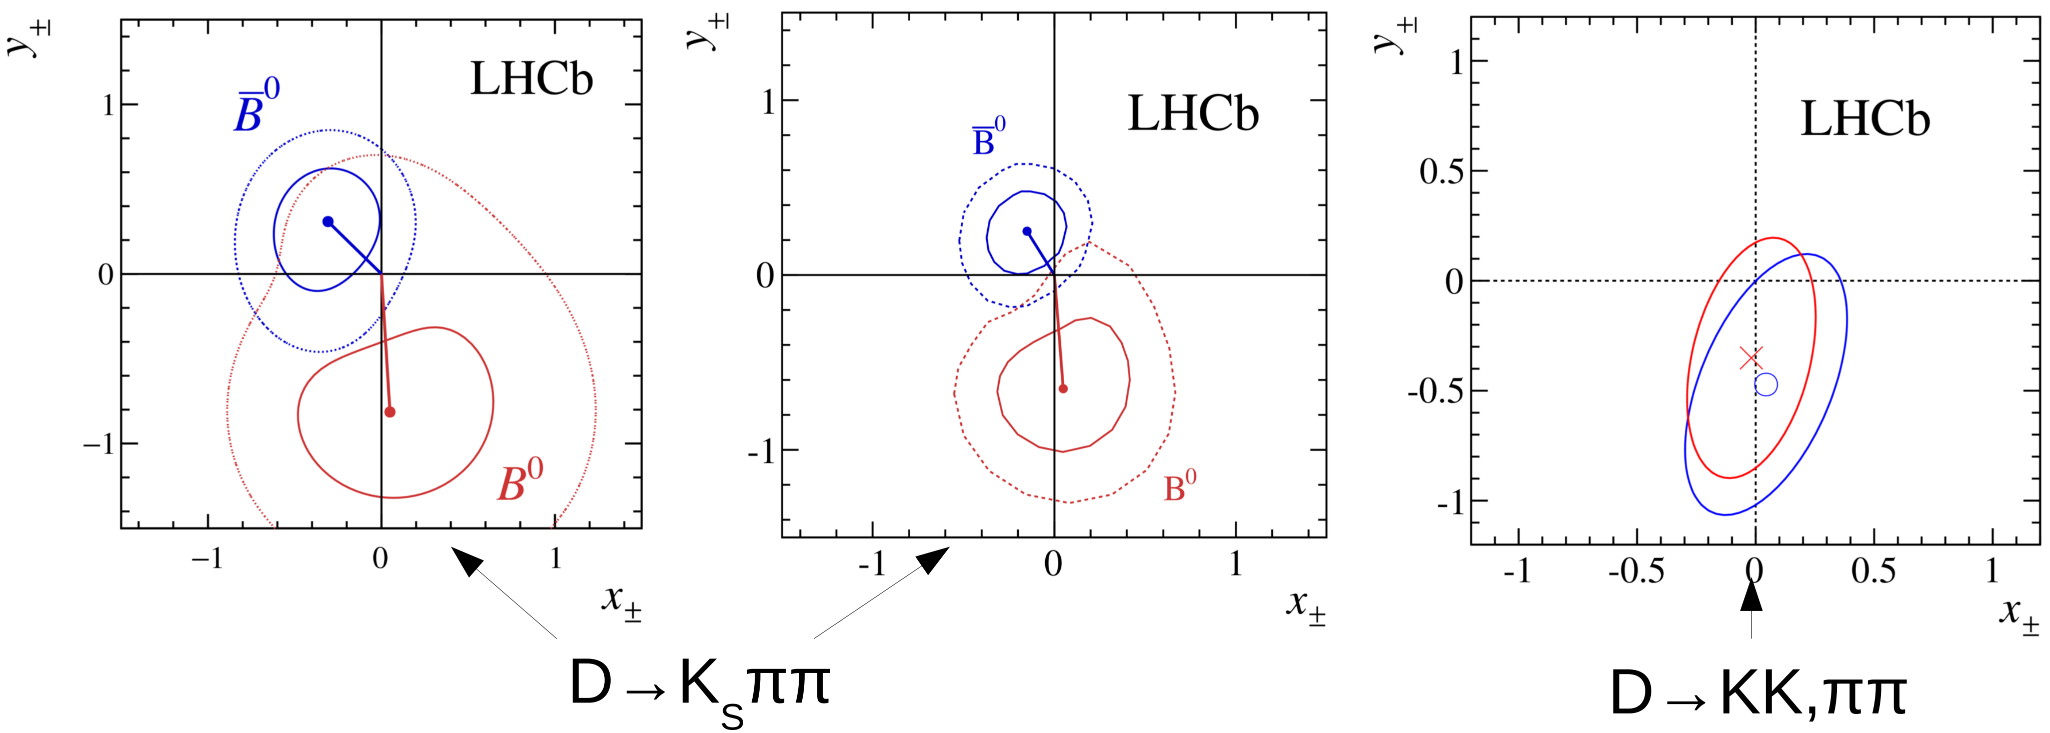
For $B^0 \to DK^{*0}$, width of the K^{*0} resonance introduces a dilution factor that depends on the $B^0 \to DK^+\pi^-$ Dalitz plot

This has been studied with $D \to K\pi$ (PRD 92 (2015) 012012), KK and ππ (arXiv:1602.03455) decays



γ from $B^0 \rightarrow DK^{*0}$

arXiv:1604.01525 | arXiv:1605.01082 | arXiv:1602.03455



Comparison of results in terms of $x_\pm = r_B\cos(\delta_B \pm \gamma)$, $y_\pm = r_B\sin(\delta_B \pm \gamma)$

RED: (x_+,y_+), BLUE (x_-,y_-)

γ combination

LHCb-CONF-2016-001

Many observables with sensitivity to γ

- $B^+ \to DK^+$, $D \to h^+h^-$, GLW/ADS, $3\,\mathrm{fb}^{-1}$ [4]
- $B^+ \to DK^+$, $D \to h^+\pi^-\pi^+\pi^-$, quasi-GLW/ADS, $3\,\mathrm{fb}^{-1}$ [4]
- $B^+ \to DK^+$, $D \to h^+h^-\pi^0$, quasi-GLW/ADS, $3\,\mathrm{fb}^{-1}$ [5]
- $B^+ \to DK^+$, $D \to K^0_S h^+h^-$, model-independent GGSZ, $3\,\mathrm{fb}^{-1}$ [6]
- $B^+ \to DK^+$, $D \to K^0_S K^+\pi^-$, GLS, $3\,\mathrm{fb}^{-1}$ [7]
- $B^0 \to DK^+\pi^-$, $D \to h^+h^-$, GLW-Dalitz, $3\,\mathrm{fb}^{-1}$ [8]
- $B^0 \to DK^{*0}$, $D \to K^+\pi^-$, ADS, $3\,\mathrm{fb}^{-1}$ [9]
- $B^0 \to DK^{*0}$, $D \to K^0_S\pi^+\pi^-$, model-dependent GGSZ, $3\,\mathrm{fb}^{-1}$ [10]
- $B^+ \to DK^+\pi^+\pi^-$, $D \to h^+h^-$, GLW/ADS, $3\,\mathrm{fb}^{-1}$ [11]
- $B^0_s \to D_s^{\mp}K^{\pm}$, time-dependent, $1\,\mathrm{fb}^{-1}$ [12],

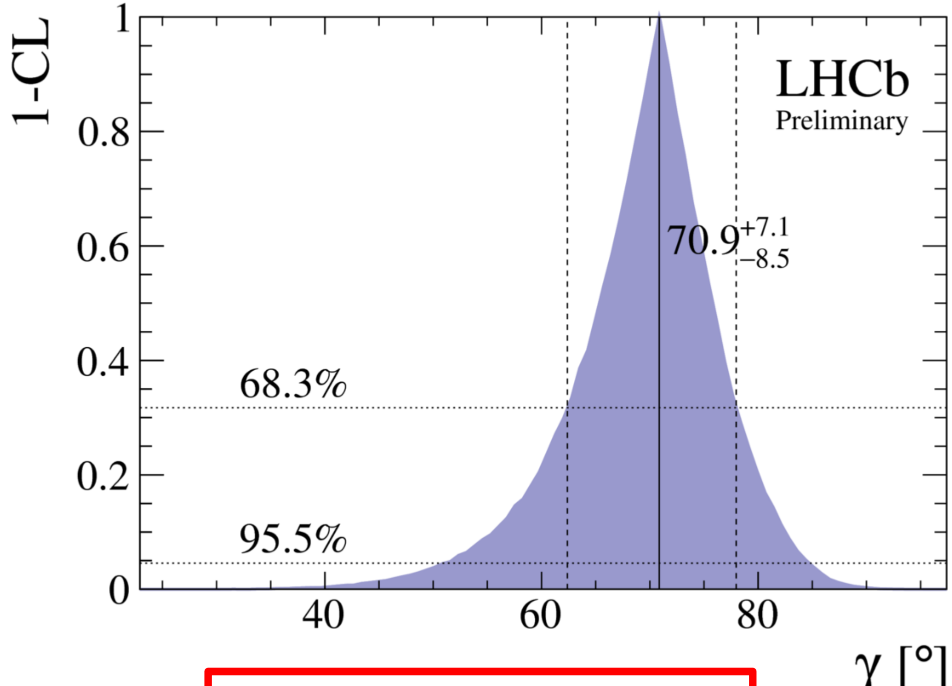
New results discussed on previous slides

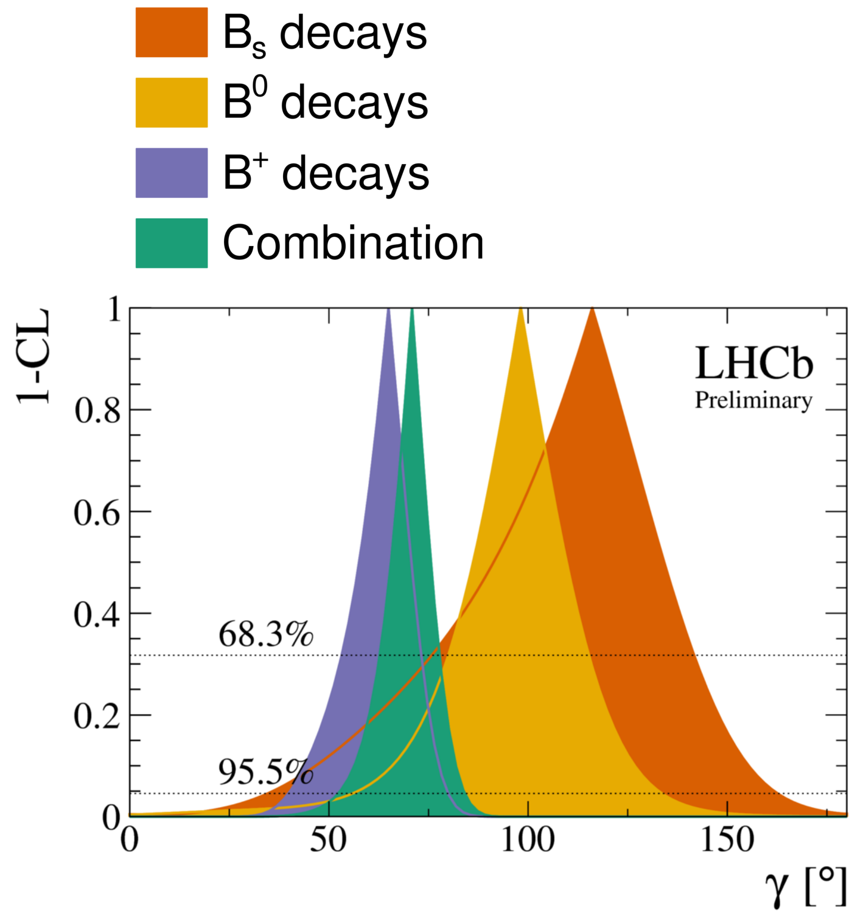
γ combination

LHCb-CONF-2016-001

Many observables with sensitivity to γ



$\gamma = (70.9\ ^{+7.1}_{-8.5})^\circ$



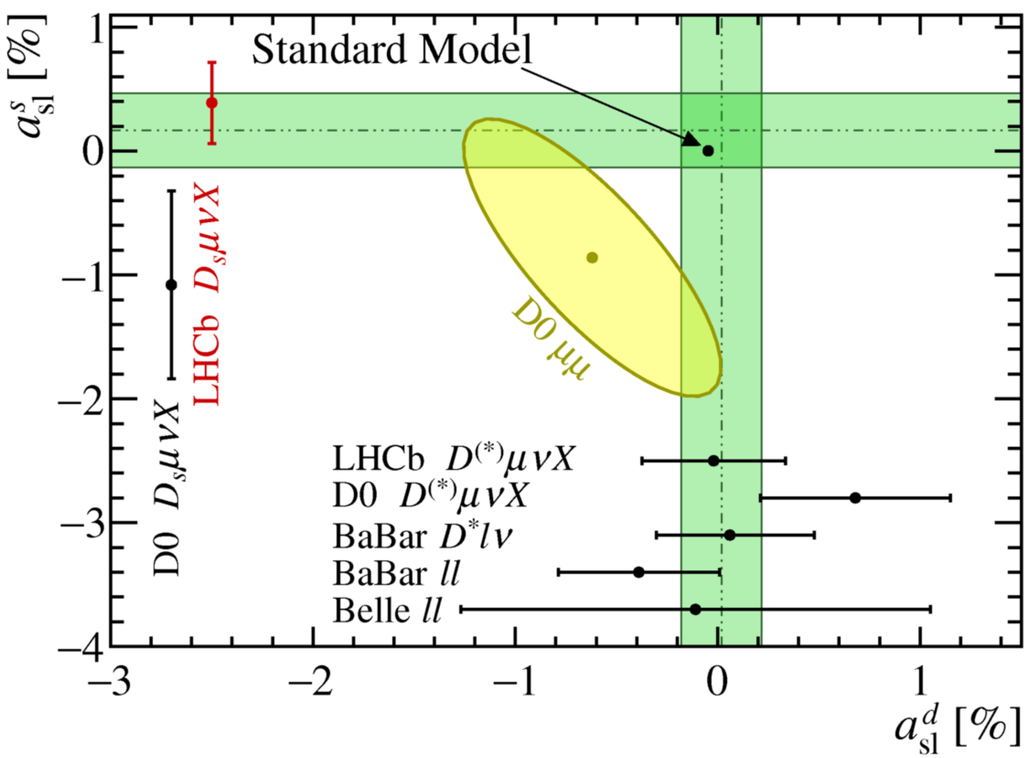
World average including BaBar, Belle, CDF results will give marginally better precision

Not yet at desired precision, but great progress

CP violation in $B^0_{(s)}$ mixing

arXiv:1605.09768

- Evidence of non-SM CP violation in inclusive dimuon asymmetry from the D0 collaboration
  - PRD 89 (2014) 012002
- Semileptonic asymmetries $a_{sl}(B^0)$ and $a_{sl}(B_s^0)$ however consistent with SM ~ (0,0)
  - $a_{sl}(B^0)$ by BaBar, Belle, LHCb, D0
  - $a_{sl}(B_s^0)$ by LHCb (new), D0
- Possibility of additional contributions to inclusive dimuon asymmetry under investigation
  - PR D87 (2013) 074020

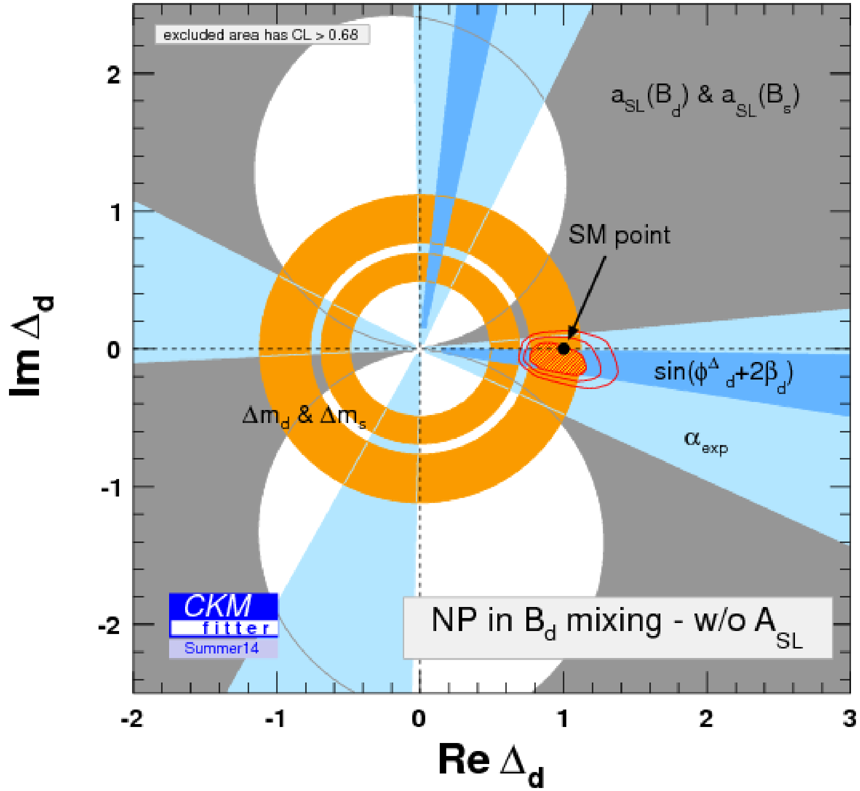


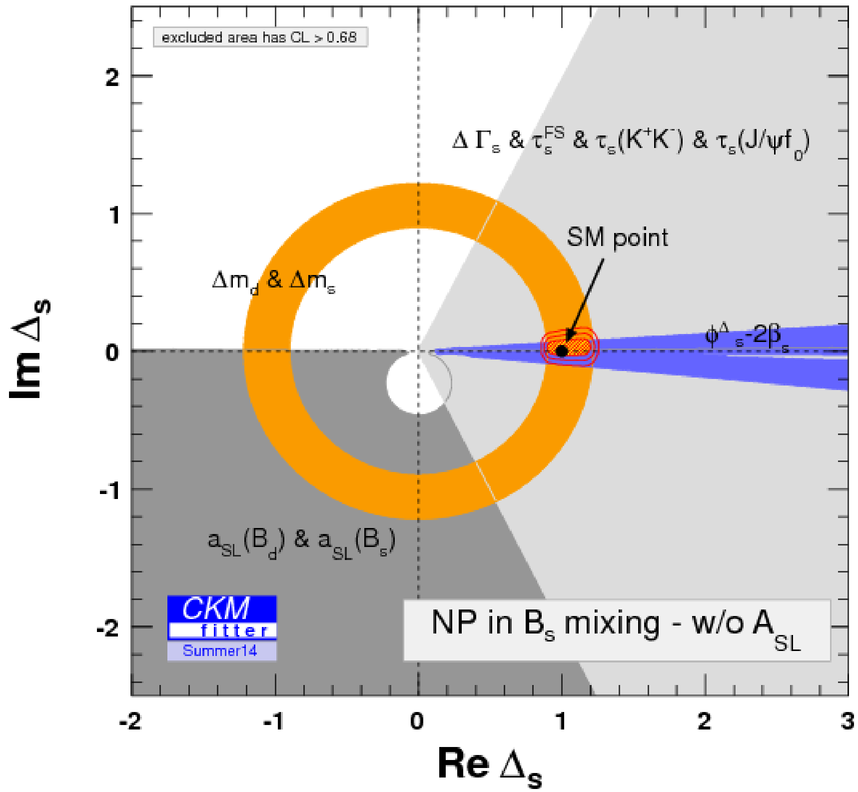
$a_{sl}(B_s^0) = (0.39 \pm 0.26 \pm 0.20)\%$

Limits on BSM contributions to ΔB=2

Define $M_{12}^{q} = M_{12}^{SM,q}\,\Delta_q$ and obtain constraints on (Re Δ_q, Im Δ_q)

(here not including anomalous D0 dimuon asymmetry result, and other recent results)





Rare (and some not so rare) decays

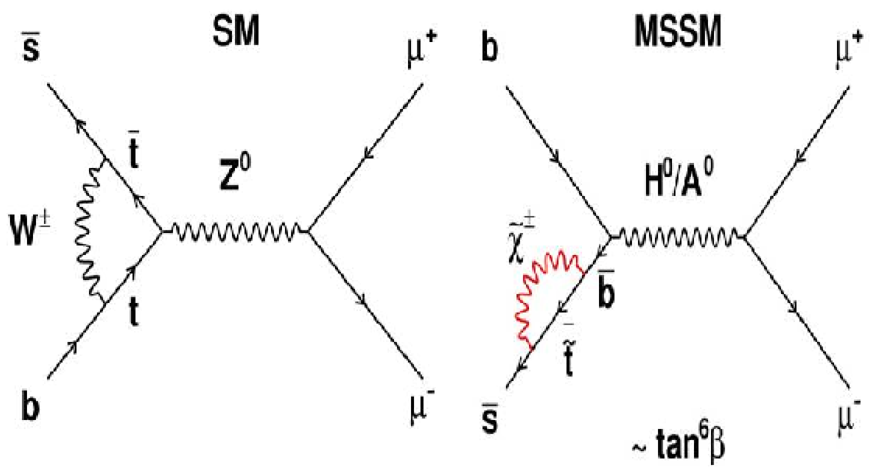
$B_s \to \mu^+\mu^-$

Nature 522 (2015) 68

Killer app. for new physics discovery

Very rare in Standard Model due to
- absence of tree-level FCNC
- helicity suppression
- CKM suppression

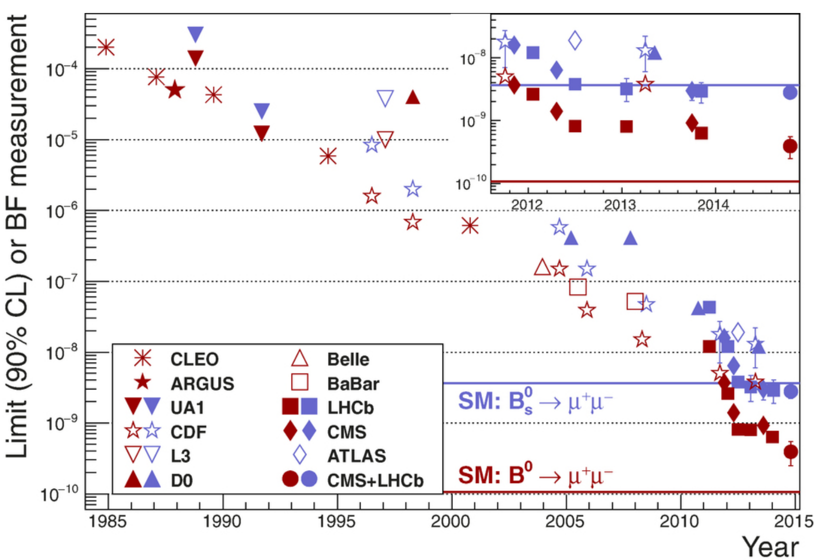
… all features which are not necessarily reproduced in extended models



$B(B_s \to \mu^+\mu^-)^{SM} = (3.66 \pm 0.23) \times 10^{-9}$

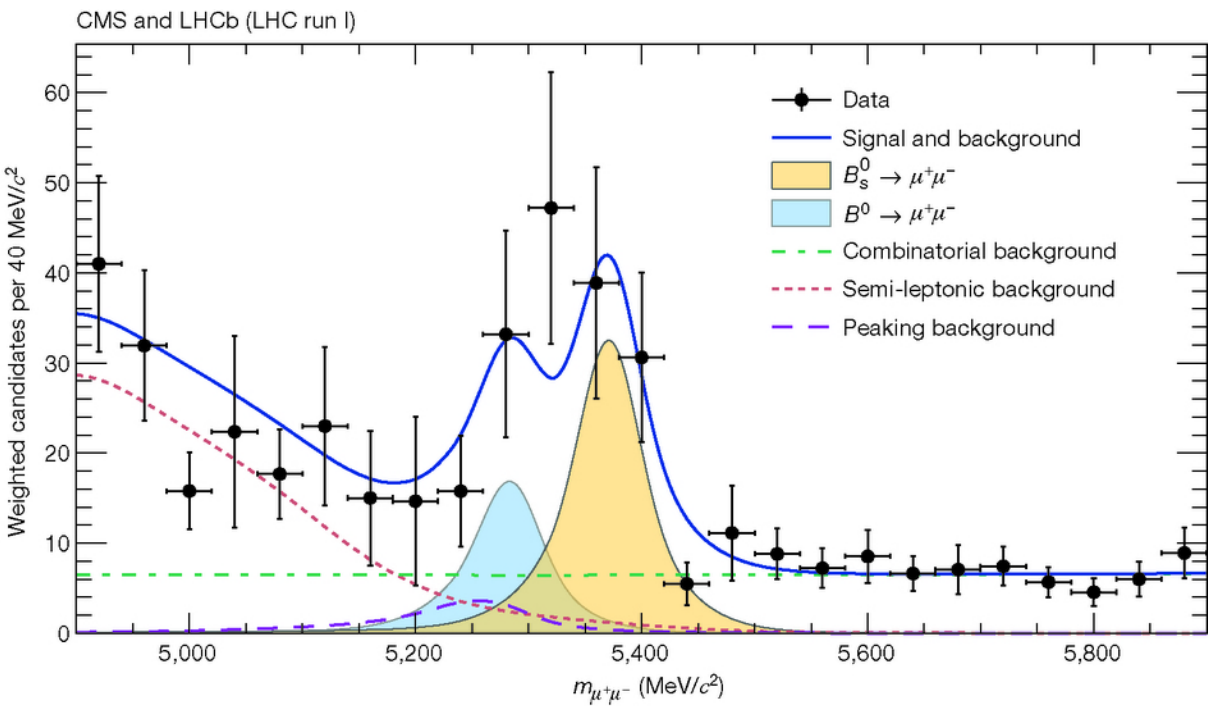
$B(B_s \to \mu^+\mu^-)^{MSSM} \sim \tan^6\beta / M^4_{A0}$

Intensively searched for over 30 years!



$B_s \to \mu^+\mu^-$

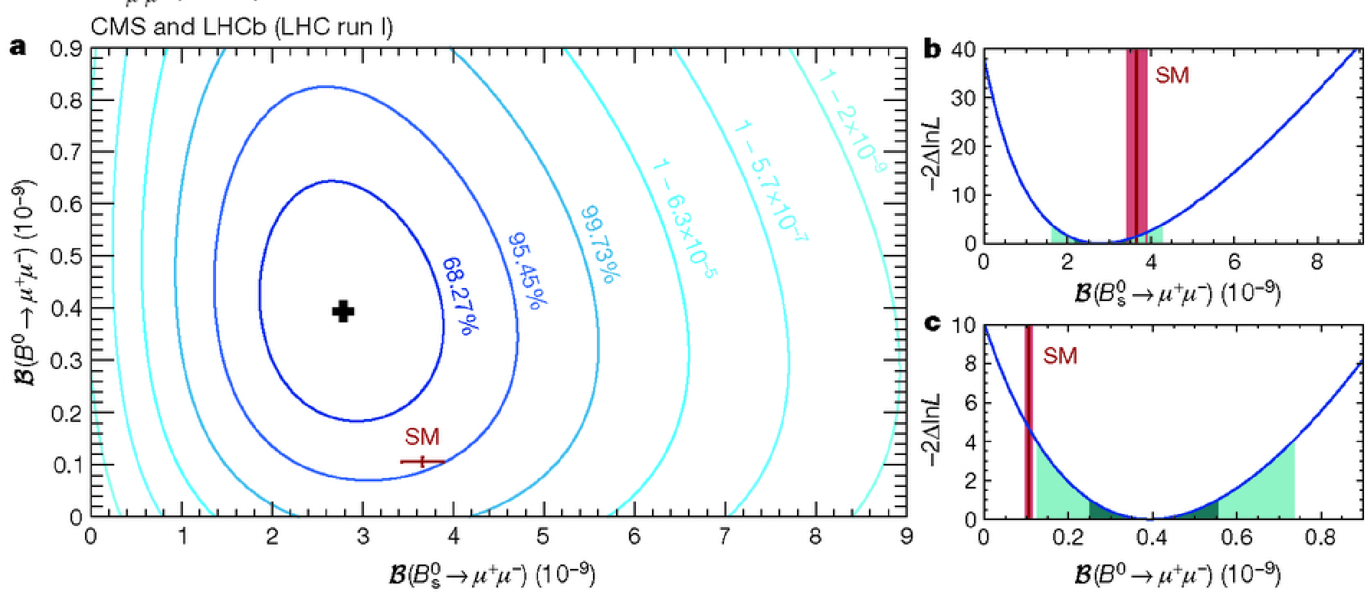
Nature 522 (2015) 68



Combination of CMS and LHCb data results in first observation of $B_s \to \mu^+\mu^-$ and first evidence for $B^0 \to \mu^+\mu^-$

Results consistent with SM at 2σ level

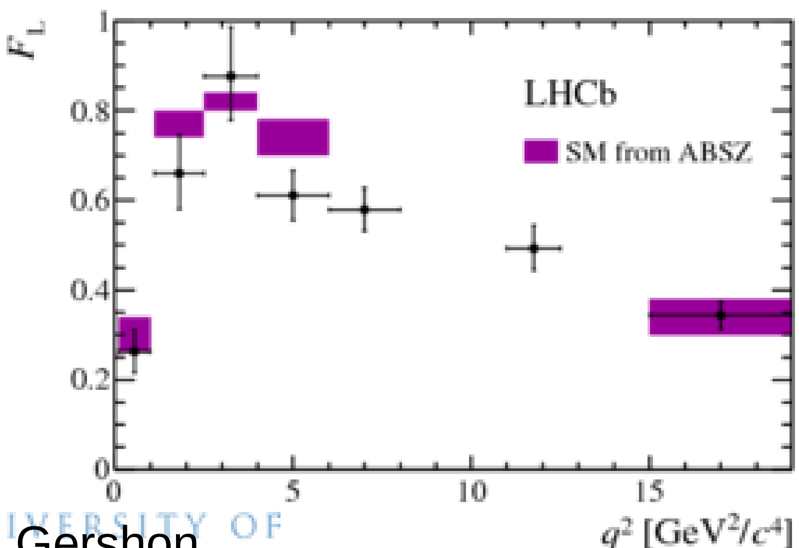
Recent results from ATLAS (not included here) have almost similar sensitivity

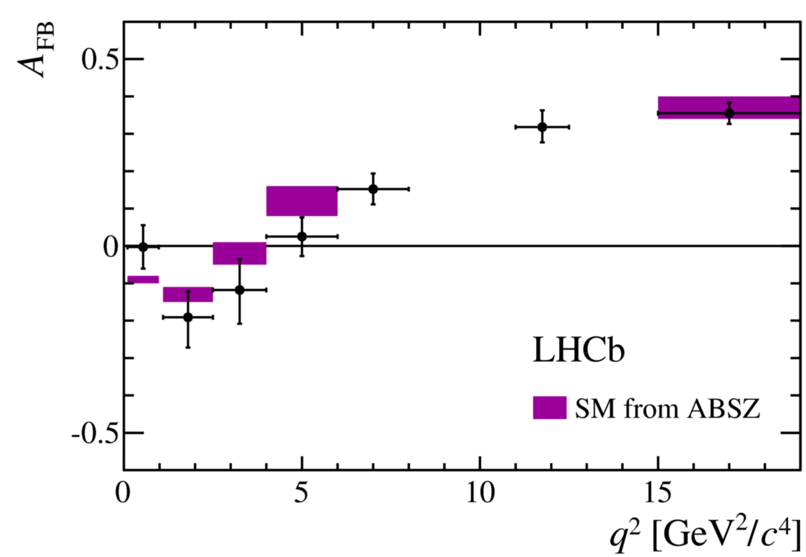


Full angular analysis of $B^0 \rightarrow K^{*0}\mu^+\mu^-$

JHEP 02 (2016) 104

- $B^0 \rightarrow K^{*0}\mu^+\mu^-$ provides superb laboratory to search for new physics in $b \rightarrow sl^+l^-$ FCNC processes
  - rates, angular distributions and asymmetries sensitive to NP
  - experimentally clean signature
  - many kinematic variables … with clean theoretical predictions
- Full set of observables measured – only a subset shown

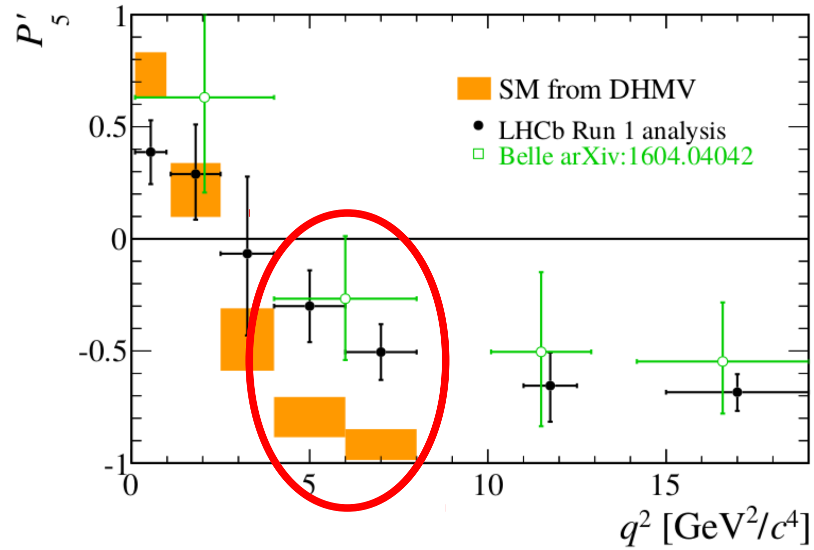




Tension with SM in the P_5' observable

JHEP 02 (2016) 104

- Dimuon pair is predominantly spin-1
  - either vector (V) or axial-vector (A)
- There are 6 non-negligible amplitudes
  - 3 for VV and 3 for VA ($K^{*0}\mu^+\mu^-$)
  - expressed as $A^{L,R}_{0,\perp,\parallel}$ (transversity basis)



- P_5' related to difference between relative phase of longitudinal (0) and perpendicularly (⊥) polarised amplitudes for VV and VA
  - constructed so as to minimise form-factor uncertainties

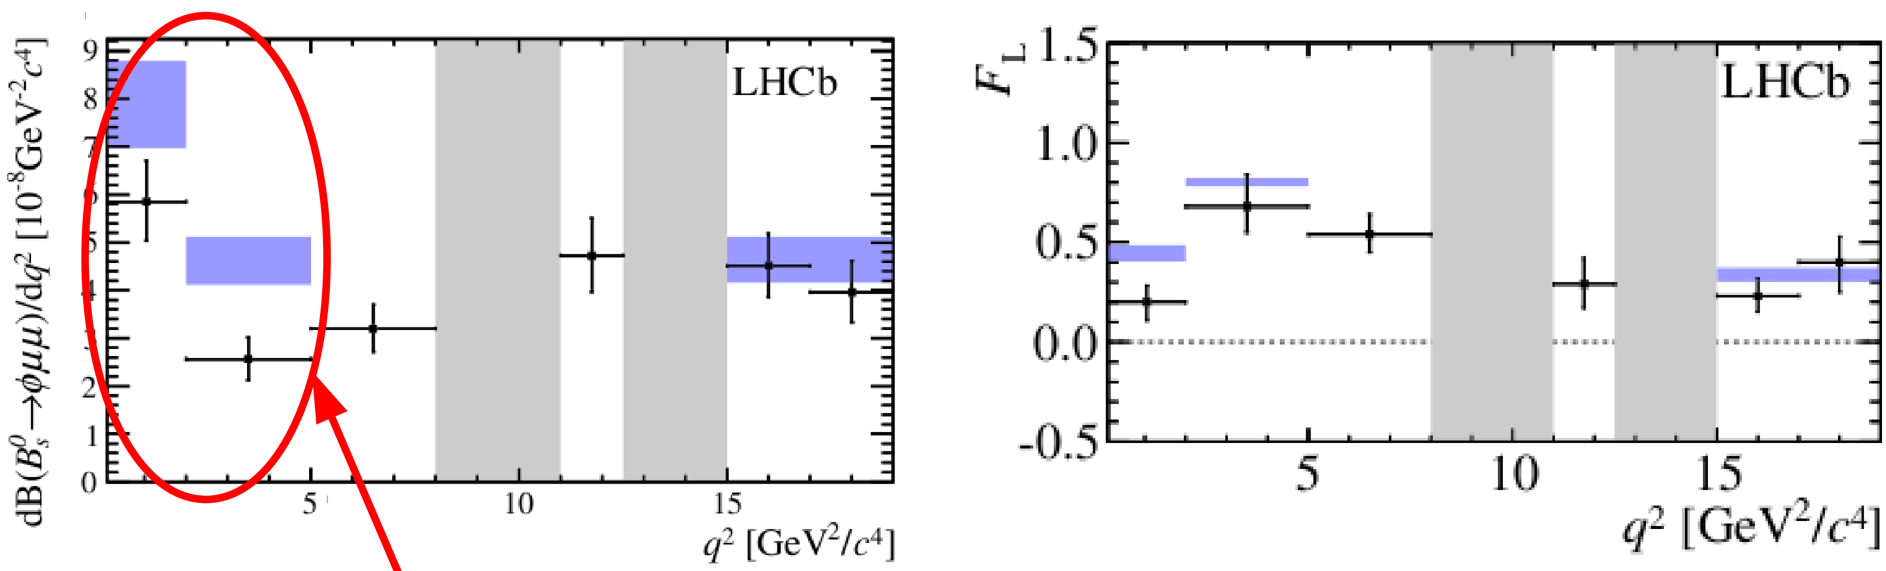
$$P_5' = \sqrt{2}\frac{\mathrm{Re}\left(A_0^L A_\perp^{L*} - A_0^R A_\perp^{R*}\right)}{\sqrt{\left(|A_0^L|^2 + |A_0^R|^2\right)\left(|A_\parallel^L|^2 + |A_\parallel^R|^2 + |A_\perp^L|^2 + |A_\perp^R|^2\right)}}$$

Sensitive to NP in V or A couplings (Wilson coefficients $C_9^{(\prime)}$ & $C_{10}^{(\prime)}$)

$B_s \to \varphi\mu^+\mu^-$

JHEP 09 (2015) 179

- Full angular analysis performed
- Not self-tagging → complementarity to $K^{*0}\mu^+\mu^-$
  - only a subset of many observables shown

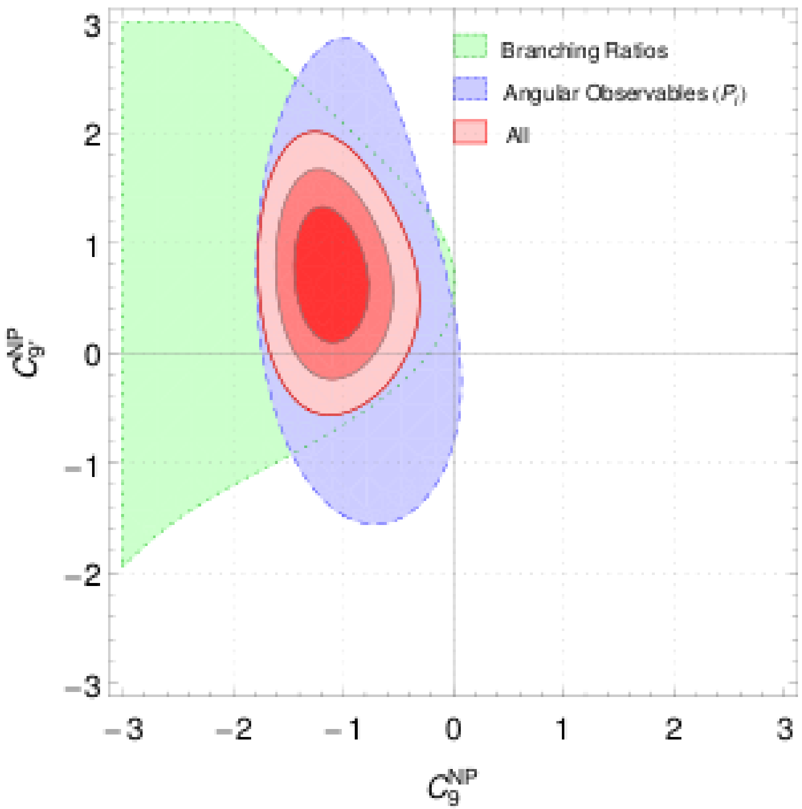


Tension in branching fraction, but angular observables consistent with SM

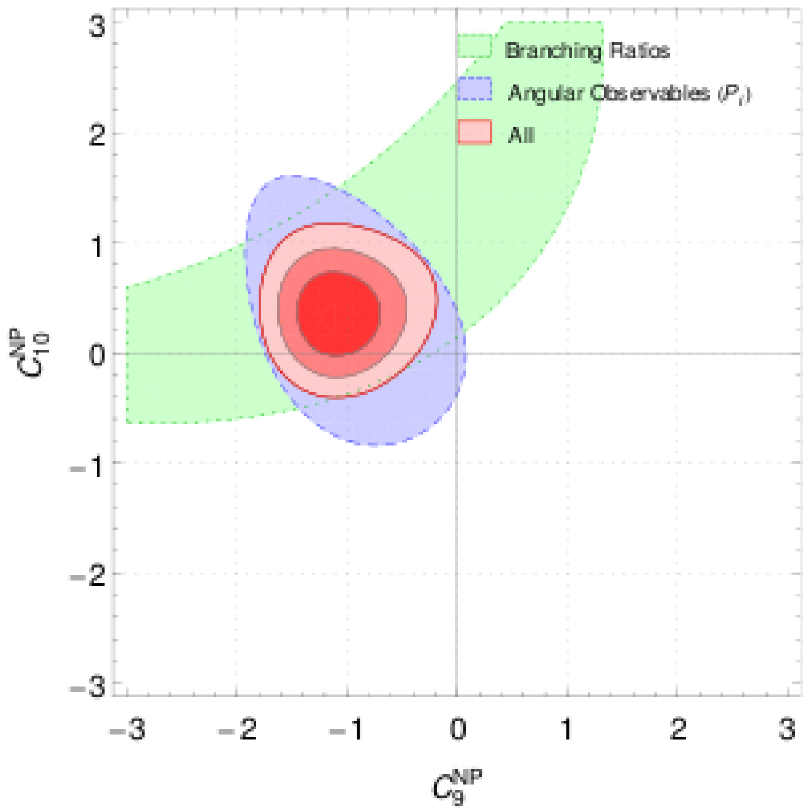
Consistent picture in $b \to sl^+l^-$ branching fractions

Global fit to Wilson coefficients

(slide from Sebastian Descotes-Genon @ FPCP 2016)



$\mathcal{C}_9^{\rm NP}, \mathcal{C}_{9'}^{\rm NP}$



$\mathcal{C}_9^{\rm NP}, \mathcal{C}_{10}^{\rm NP}$

- p-value=71% (goodness of fit), $\text{pull}_{SM} = 4.5\sigma$ (metrology)
- BRs and angular obs both favour $\mathcal{C}_9^{NP} \simeq -1$ in all “good” scenarios

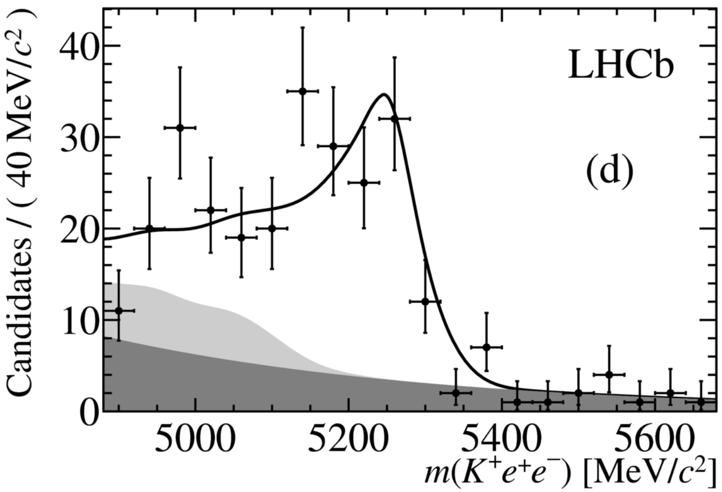
but does “NP” mean “new physics” or “non-perturbative”?

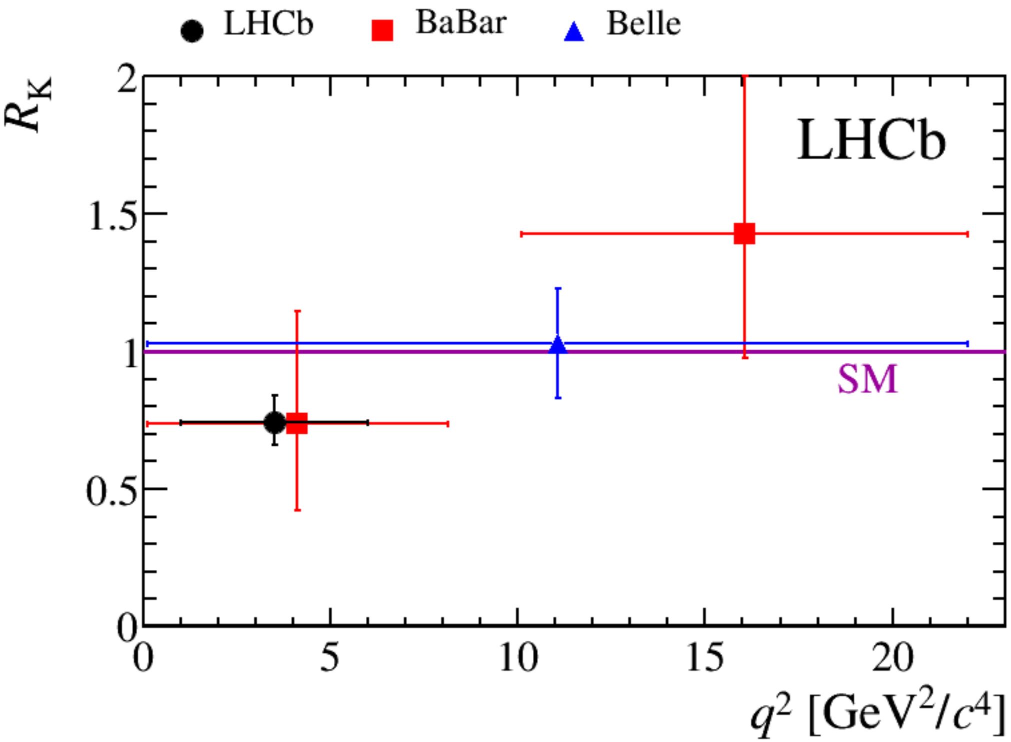
Lepton universality – R_K

PRL 113 (2014) 151601

Deficit of $B \to K\mu^+\mu^-$ compared to expectation also seen in $K\mu^+\mu^-/Ke^+e^-$ ratio (R_K)

Example mass fit for Ke^+e^-
Note huge tail due to energy loss





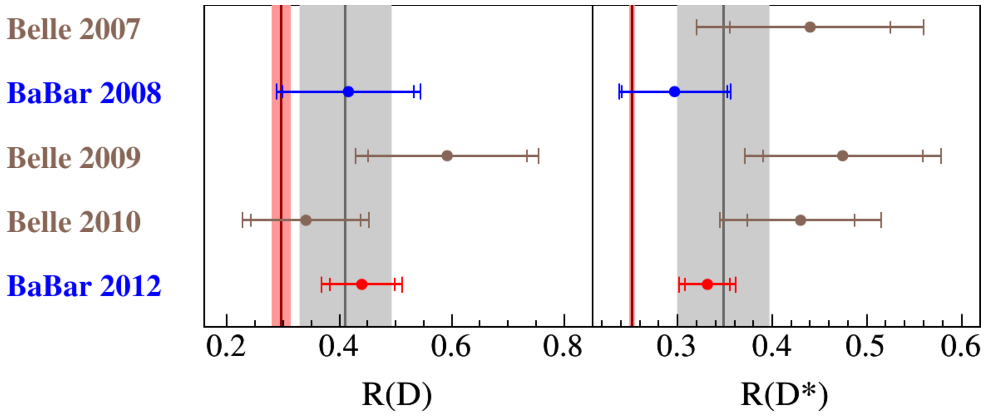
$$R_K(1 < q^2 < 6\ \text{GeV}^2) = 0.745\ ^{+0.090}_{-0.074} \pm 0.036$$

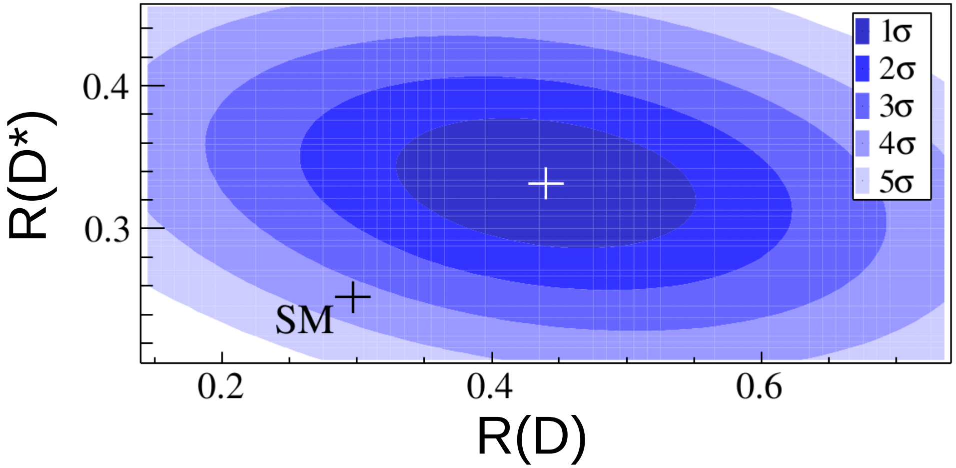
Only 2.6σ from SM but suggestive

$B \to D^{(*)}\tau\nu$

- Powerful channel to test lepton universality
  - ratios $R(D^{(*)}) = \mathcal{B}(B \to D^{(*)}\tau\nu)/\mathcal{B}(B \to D^{(*)}\mu\nu)$ could deviate from SM values, e.g. in models with charged Higgs
- Heightened interest in this area
  - anomalous results from BaBar
  - other hints of lepton universality violation, e.g. R_K , $H \to \tau\mu$

PRL 109 (2012) 101802
& PRD 88 (2013) 072012

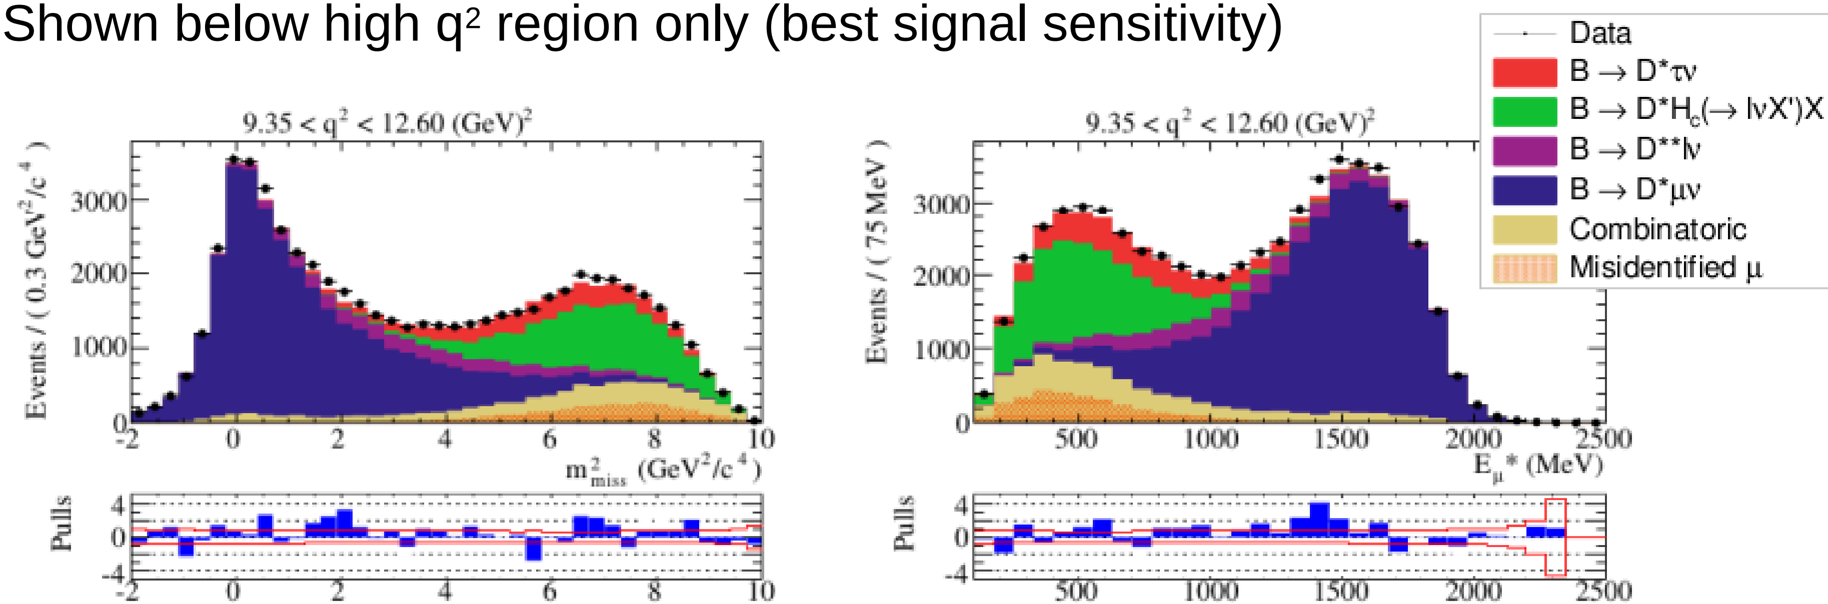




$B \to D^* \tau \nu$ at LHCb

PRL 115 (2015) 112001

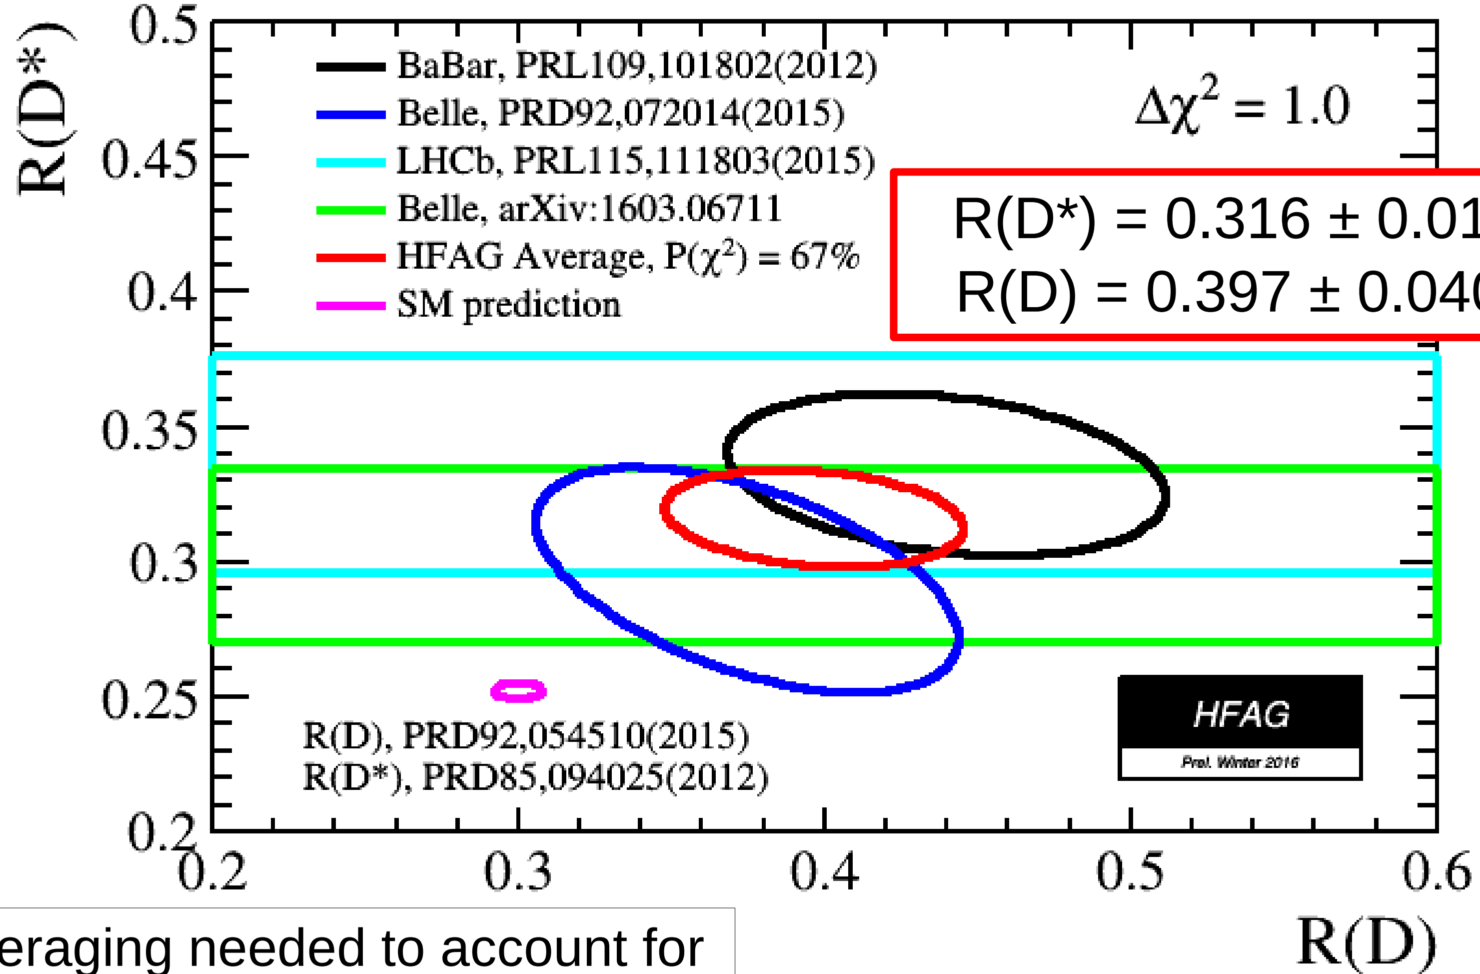
- Identify $B \to D^* \tau \nu$, $D^* \to D\pi$, $D \to K\pi$, $\tau \to \mu \nu \bar{\nu}$
  - Similar kinematic reconstruction to $\Lambda_b \to p \mu \nu$
    - Assume $p_{B,z} = (p_{D^*} + p_\mu)_z$ to calculate $M_{miss}^2 = (p_B - p_{D^*} - p_\mu)^2$
  - Require significant B, D, τ flight distances & use isolation MVA
- Separate signal from background by fitting in M_{miss}^2, q^2 and E_μ
  - Shown below high q^2 region only (best signal sensitivity)



$R(D^*) = 0.336 \pm 0.027 \pm 0.030$

$B \to D^{(*)}\tau\nu$

Tension with SM at 4.0σ



R(D*) = 0.316 ± 0.016 ± 0.010
R(D) = 0.397 ± 0.040 ± 0.028

Careful averaging needed to account for statistical and systematic correlations

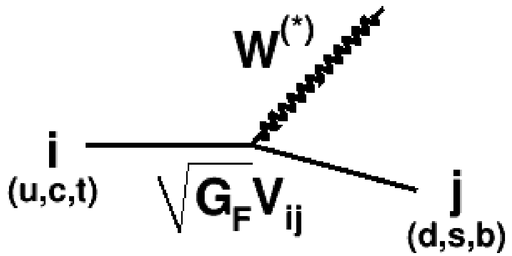
Prospects

- Data-taking progressing well
  - Expect to collect ~5/fb of 13 TeV data during Run II
  - Improve current precision by at least a factor of 2
- During LS2 (2019-20) will install upgraded detector
  - Will allow higher luminosity and improved trigger efficiency
  - Designed to accumulate 50/fb in ~5 years of operation
- Possibilities for subsequent upgrade under discussion
  - During LS3 (concomitant with HL-LHC upgrades) to extend capability (e.g. additional tracking coverage, calorimeter replacement)
  - During LS4 to allow significantly higher luminosity and/or alternative physics programme (e.g. $H \to c\bar{c}$)
  - Your ideas welcome!

- LHCb surpassed Run I performance expectations
  - huge physics output, in “core” flavour observables but also much more
  - modes with neutrinos, previously thought to be impossible
  - … and don't forget pentaquarks (and other topics not covered today)
  - several potential hints of BSM effects to be explored further
- Important improvements in the trigger for Run II
- Data taking going well so far
  - first physics papers on Run II data already submitted
  - much to look forward to!
- Beyond Run II will install LHCb upgrade to enable even high luminosity
  - also starting to think of even longer term possibilities

BACK UP!

Quark flavour mixing
a.k.a. CKM phenomenology



$$V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} = \begin{pmatrix} 1-\frac{1}{2}\lambda^2 & \lambda & A\lambda^3(\rho-i\eta) \\ -\lambda & 1-\frac{1}{2}\lambda^2 & A\lambda^2 \\ A\lambda^3(1-\rho-i\eta) & -A\lambda^2 & 1 \end{pmatrix} + O(\lambda^4)$$

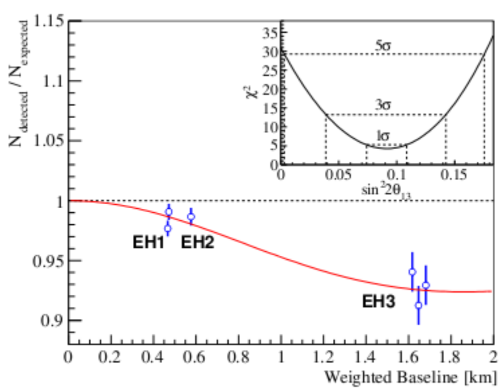
- CKM theory is highly predictive
  - huge range of phenomena over a massive energy scale predicted by only 4 independent parameters (+ G_F + m_q + QCD)
- CKM matrix is hierarchical
  - distinctive flavour sector of Standard Model not necessarily replicated in extended theories → strong constraints on NP models
- CKM mechanism introduces CP violation
  - only source of CP violation in the Standard Model ($m_\nu = \theta_{QCD} = 0$)

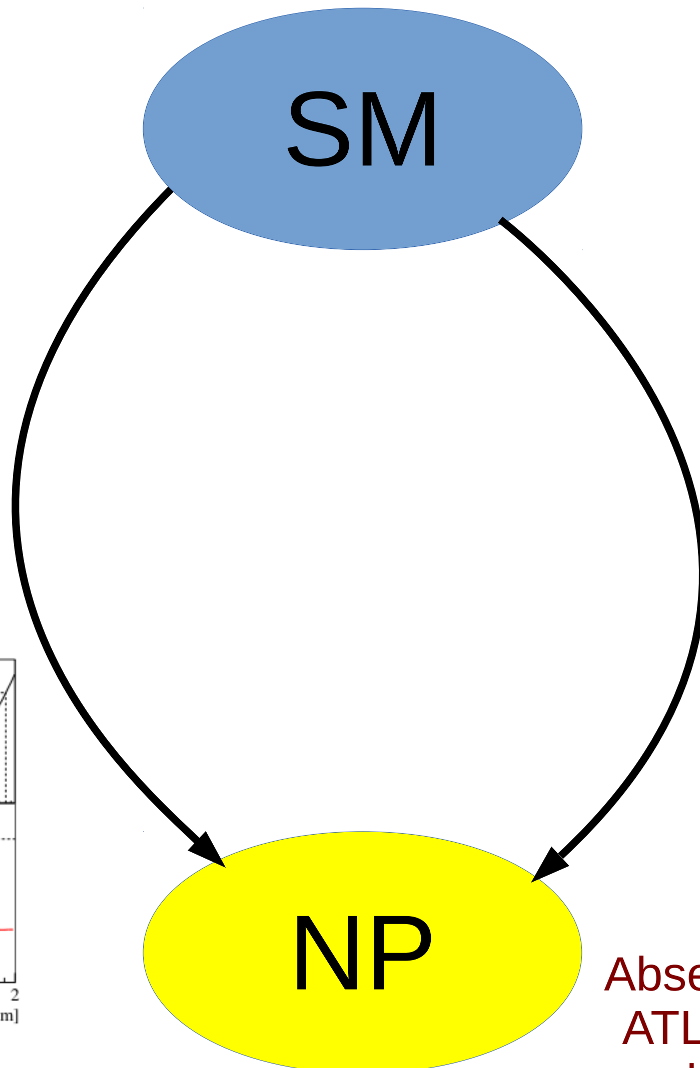
Two routes to heaven

for quark flavour physics

CP violation
(extra sources must exist)

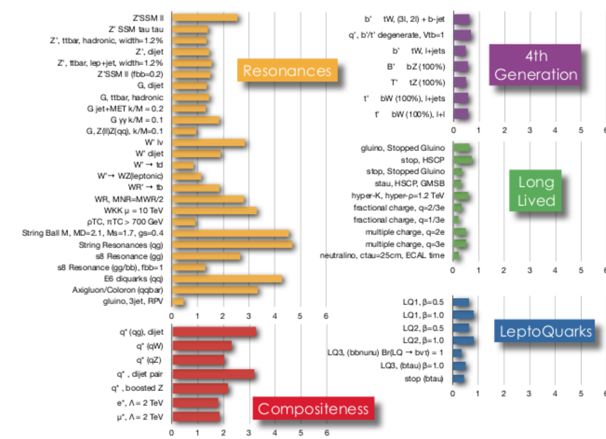
But
- No guarantee of the scale
- No guarantee of effects in the quark sector
- Realistic prospects for CPV measurement in νs due to large θ_{13}





Rare decays
(strong theoretical arguments)

But
- How high is the NP scale?
- Why have FCNC effects not been seen?

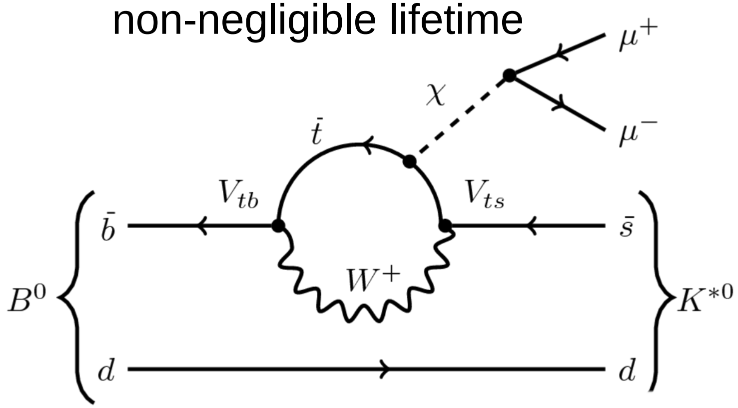


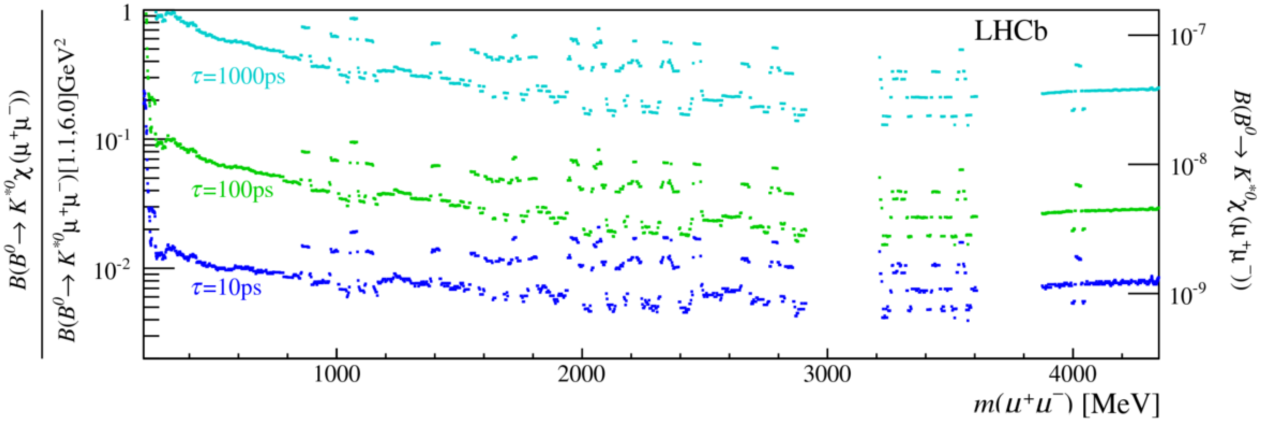
Absence of clear NP signals at ATLAS/CMS → argument for searches via rare decays stronger

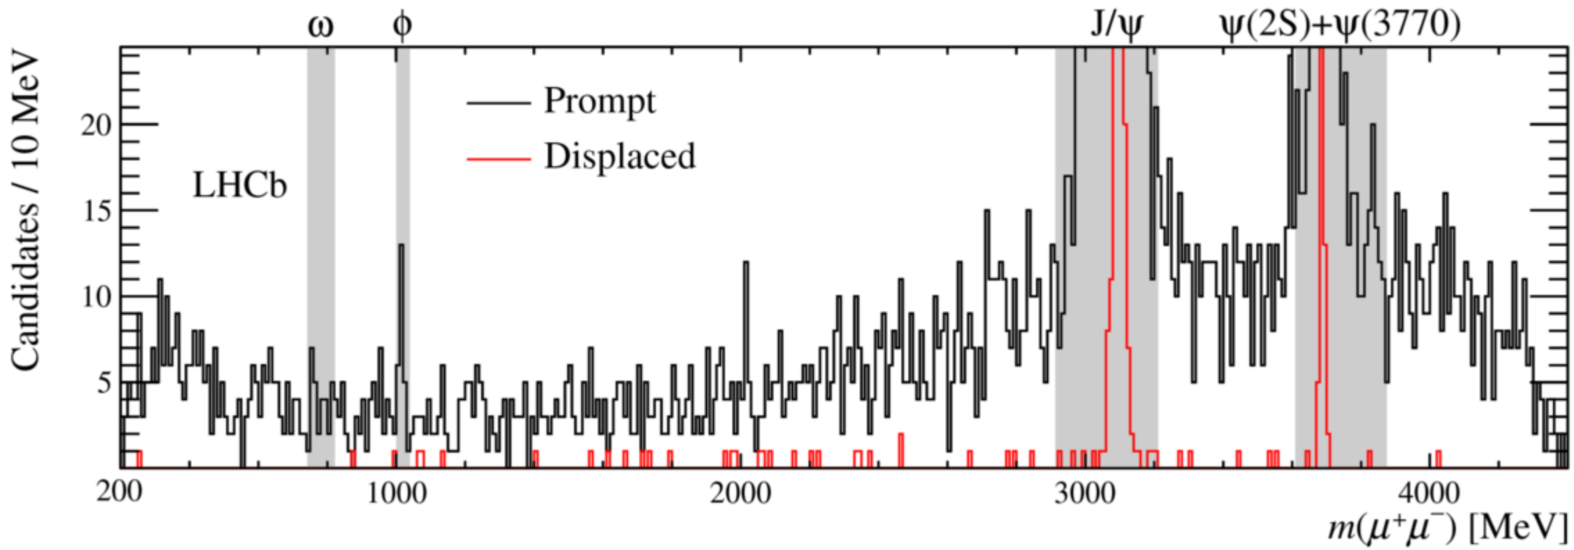
Search for hidden sector bosons

Search for narrow μμ peak in $B \to K^{*0}\mu\mu$ decays corresponding to χ with either negligible or non-negligible lifetime

PRL 115 (2015) 161802



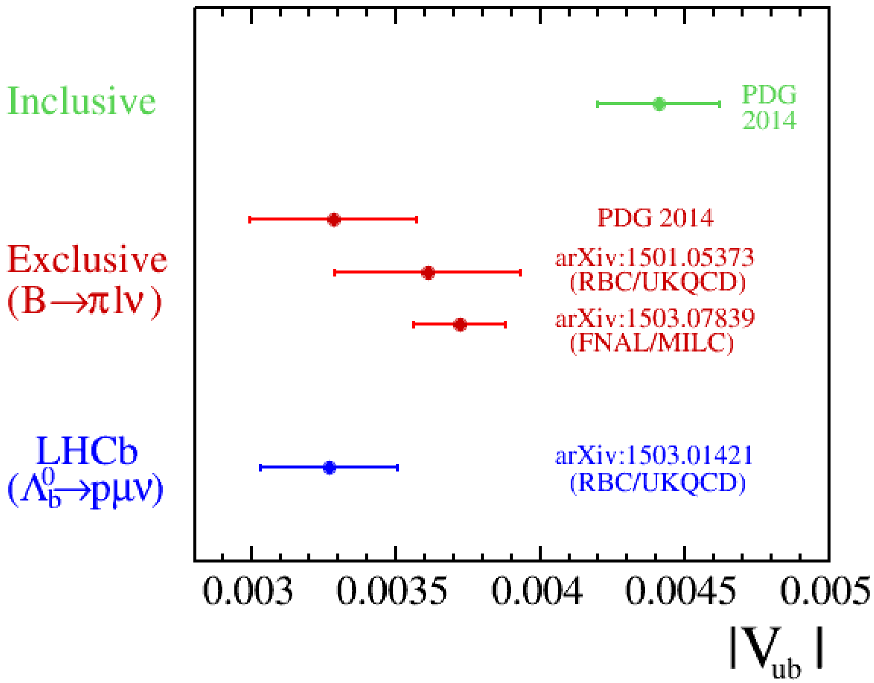


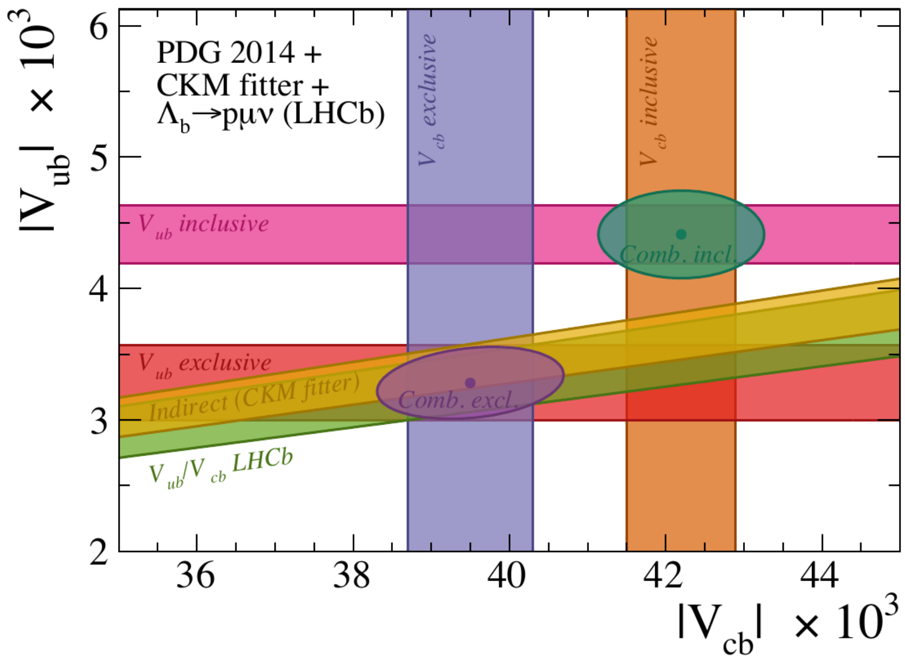


No significant peak away from known resonances

$|V_{ub}/V_{cb}|$ from $\Lambda_b \to p\mu\nu / \Lambda_b \to \Lambda_c \mu\nu$

Nature Phys. 11 (2015) 743





$$\frac{\mathcal{B}(\Lambda_b \to p\mu^-\overline{\nu}_\mu)_{q^2>15\,\mathrm{GeV}^2/c^4}}{\mathcal{B}(\Lambda_b \to \Lambda_c\mu\nu)_{q^2>7\,\mathrm{GeV}^2/c^4}} = (1.00 \pm 0.04(stat) \pm 0.08(syst)) \times 10^{-2}$$

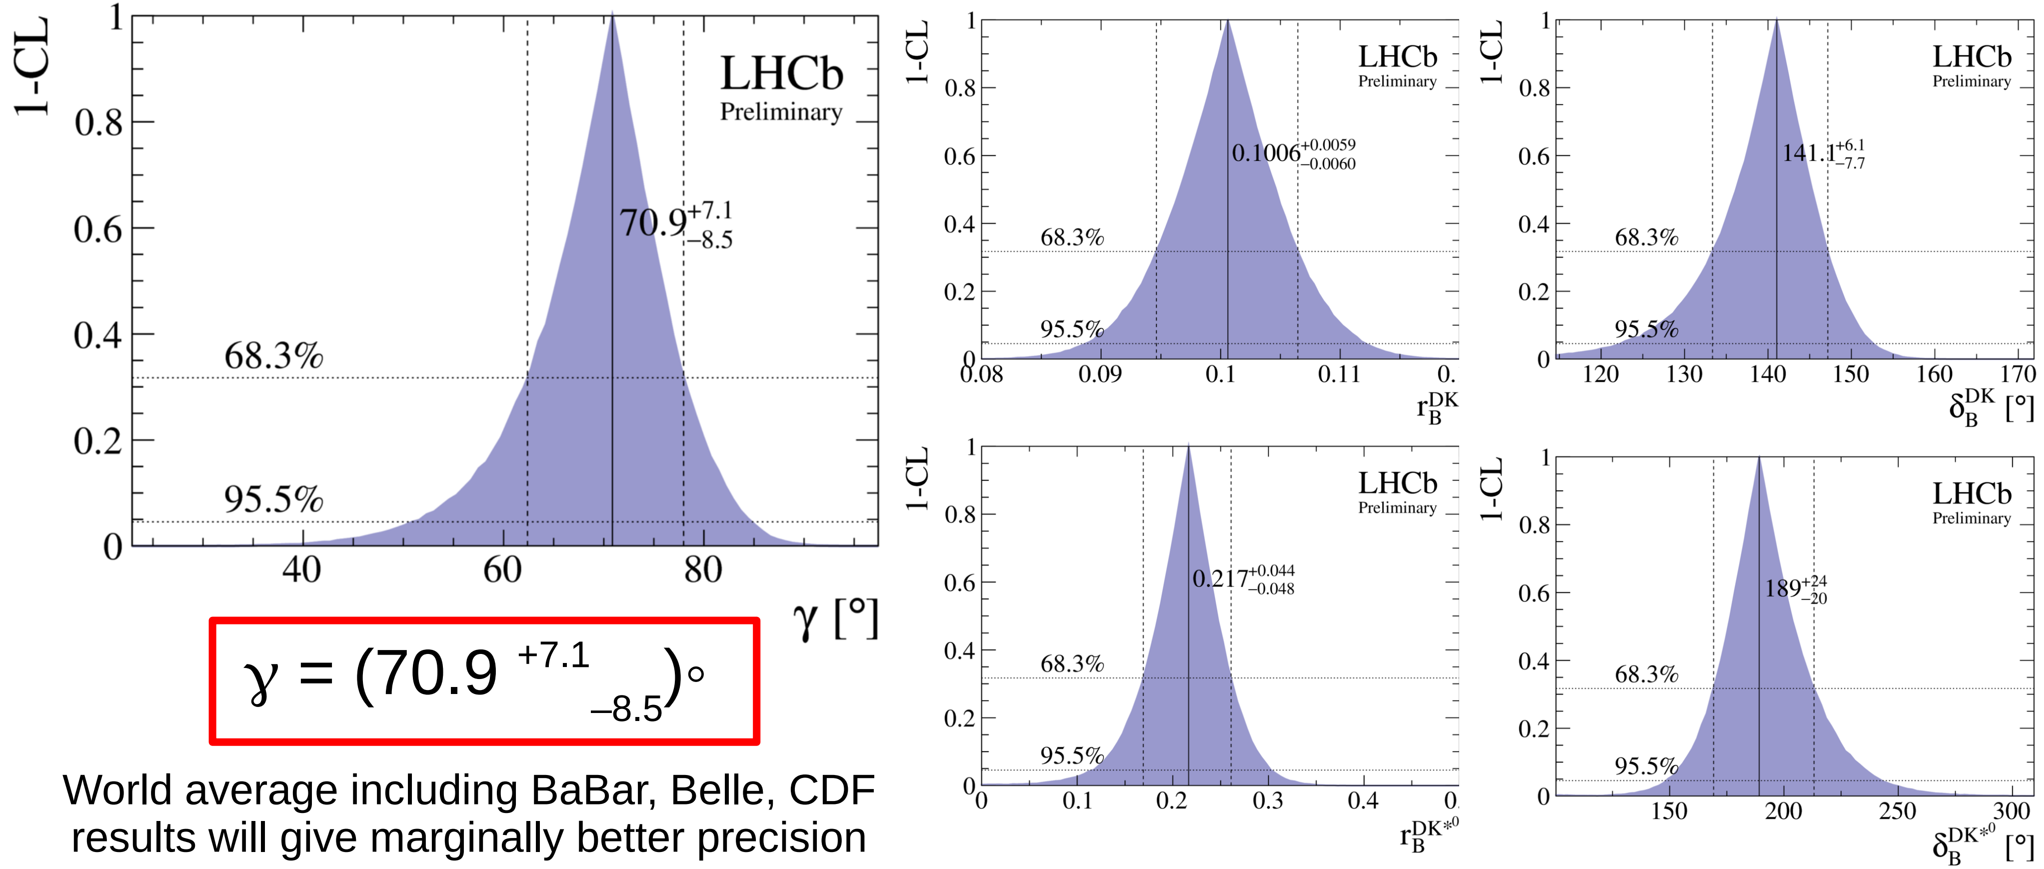
$$\frac{|V_{ub}|}{|V_{cb}|} = 0.083 \pm 0.004(\mathrm{expt}) \pm 0.004(\mathrm{lattice})$$

- Rules out models with RH currents
- Compatible with UT fit (β,γ)

γ combination

LHCb-CONF-2016-001

Many observables with sensitivity to γ



$$\gamma = (70.9\ ^{+7.1}_{-8.5})^\circ$$

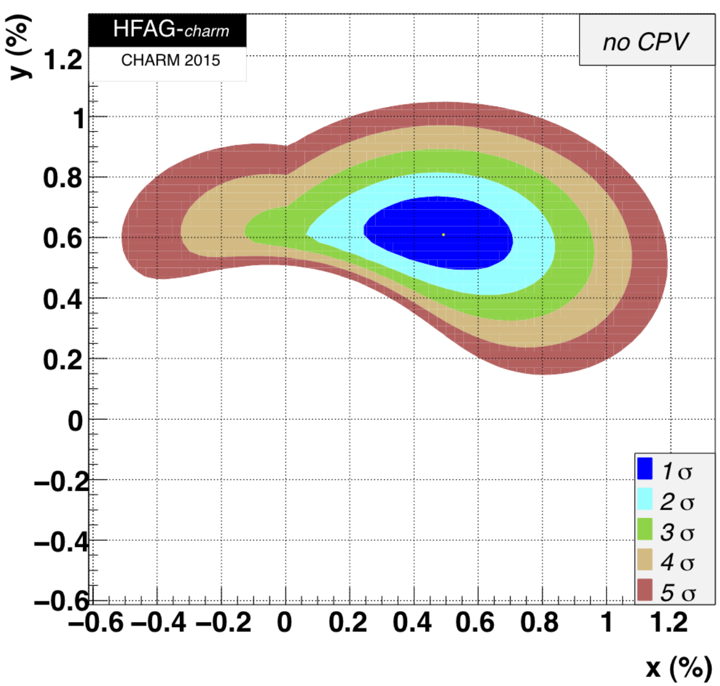
World average including BaBar, Belle, CDF results will give marginally better precision

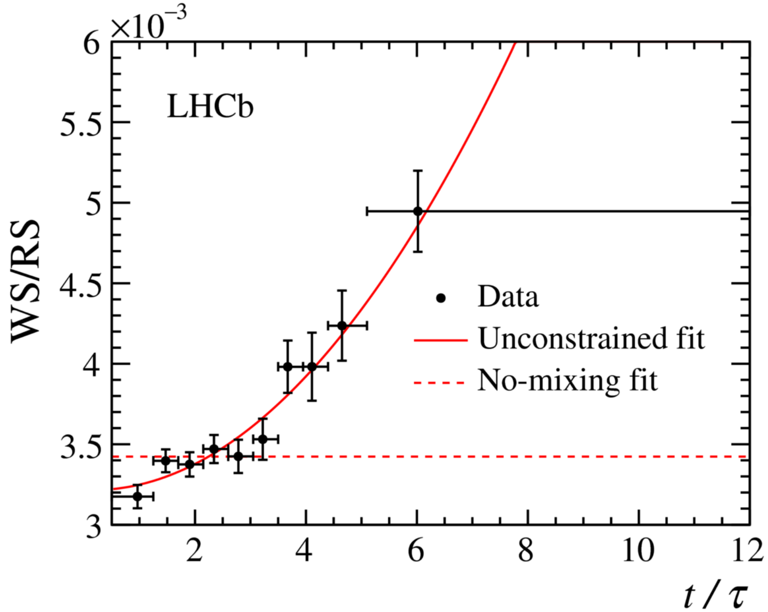
Not yet at desired precision, but great progress

Charm mixing with D→Kπππ

LHCb-PAPER-2015-057

Multibody charm decays also of interest to study charm oscillations (also to constrain hadronic parameters needed in the γ fit)





Charm mixing parameters <1%

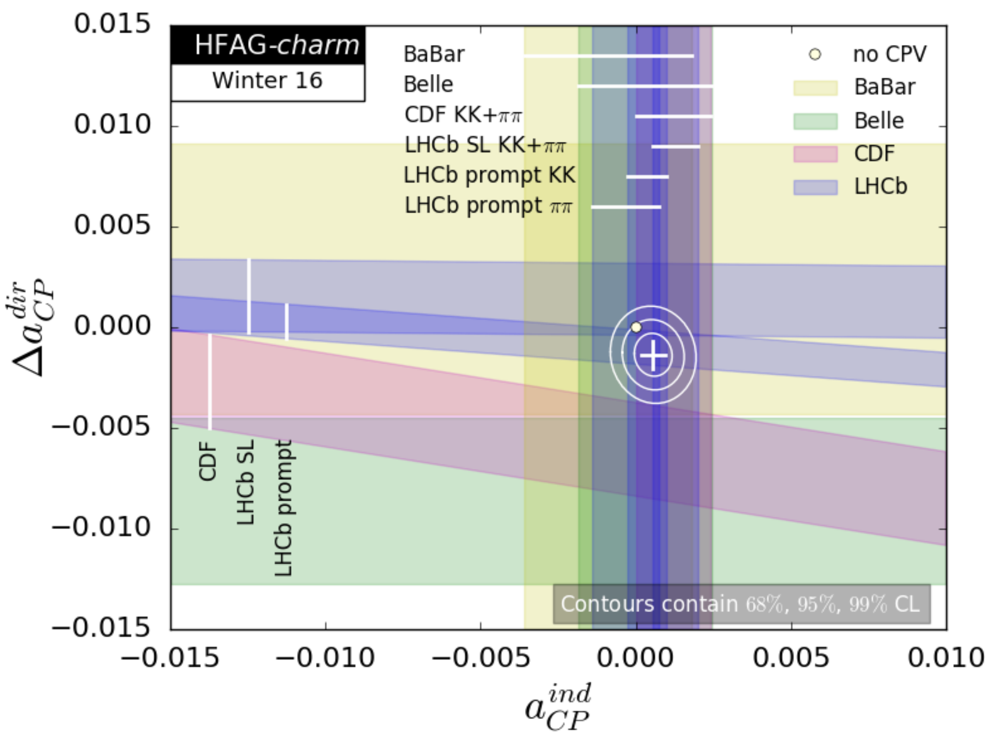
Still not established whether $x \equiv \Delta m_D/\Gamma_D \neq 0$

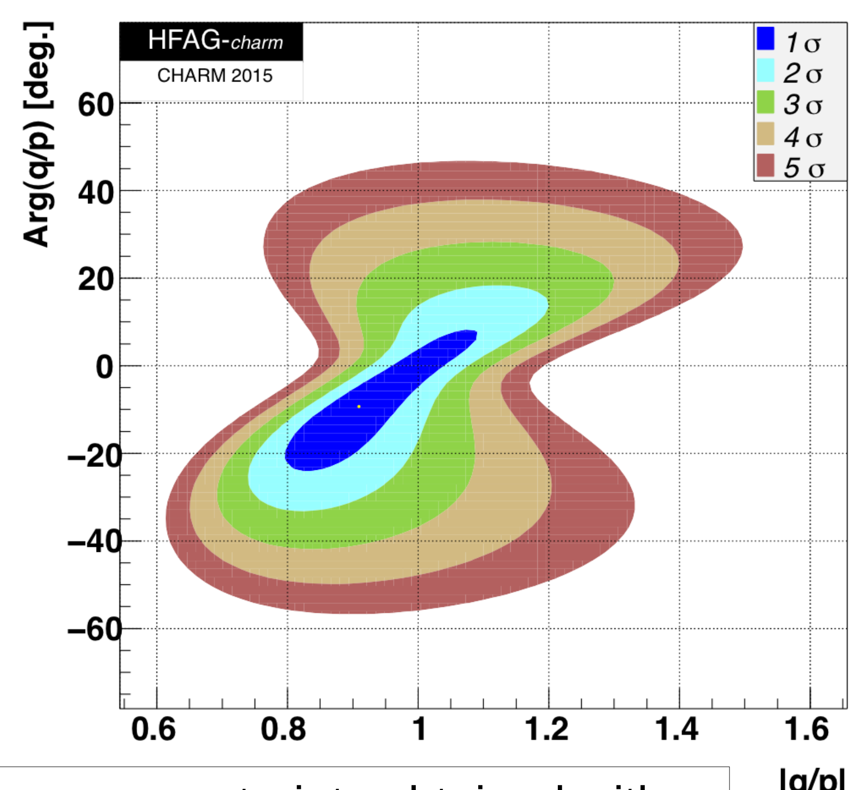
Charm CP violation

LHCb-PAPER-2015-055

No evidence for CP violation in the charm system, whether in mixing, decay or mixing-decay interference

Latest: $\Delta A_{CP} \equiv A_{CP}(D \rightarrow KK) - A_{CP}(D \rightarrow \pi\pi) = (-0.10 \pm 0.08 \pm 0.03)\ \%$





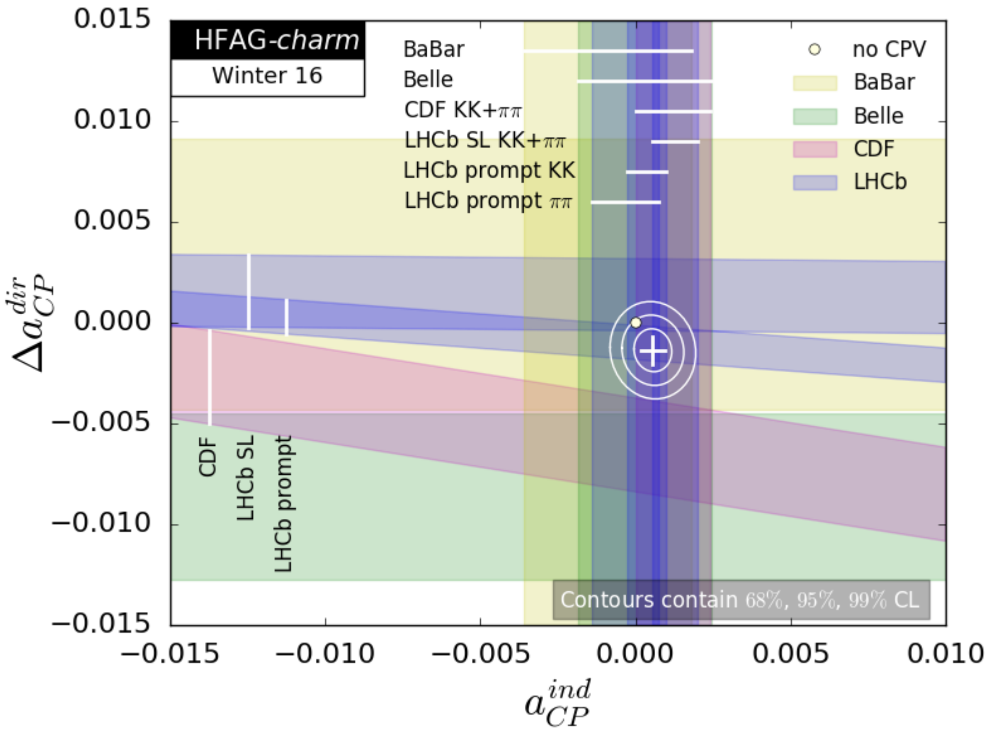
Much stronger constraints obtained with minimal assumption on CPV in decays

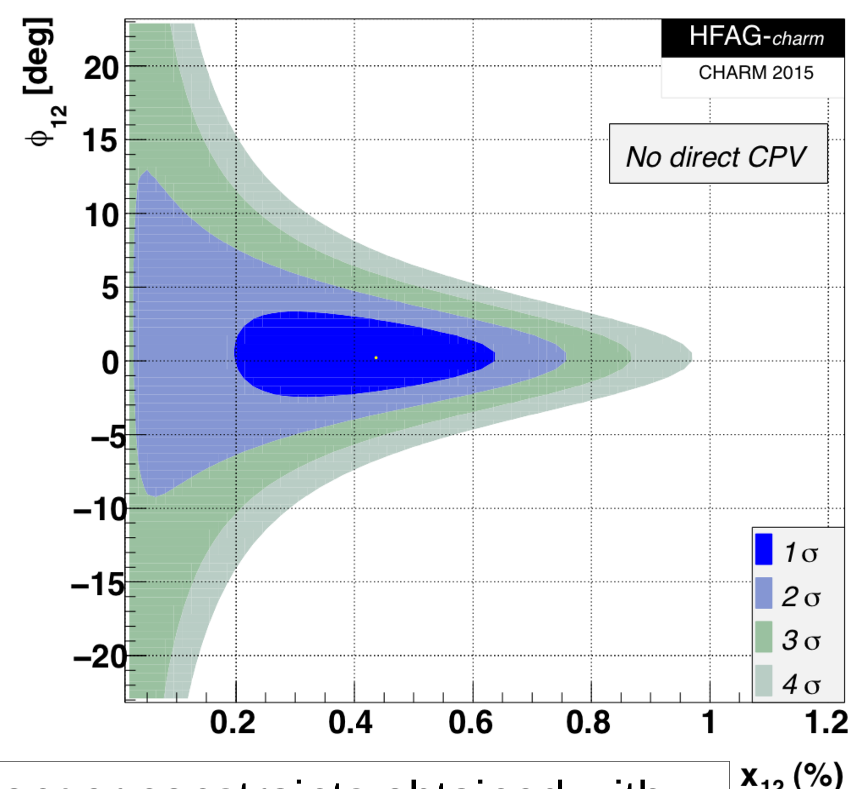
Charm CP violation

LHCb-PAPER-2015-055

No evidence for CP violation in the charm system, whether in mixing, decay or mixing-decay interference

Latest: $\Delta A_{CP} \equiv A_{CP}(D \rightarrow KK) - A_{CP}(D \rightarrow \pi\pi) = (-0.10 \pm 0.08 \pm 0.03)$ %

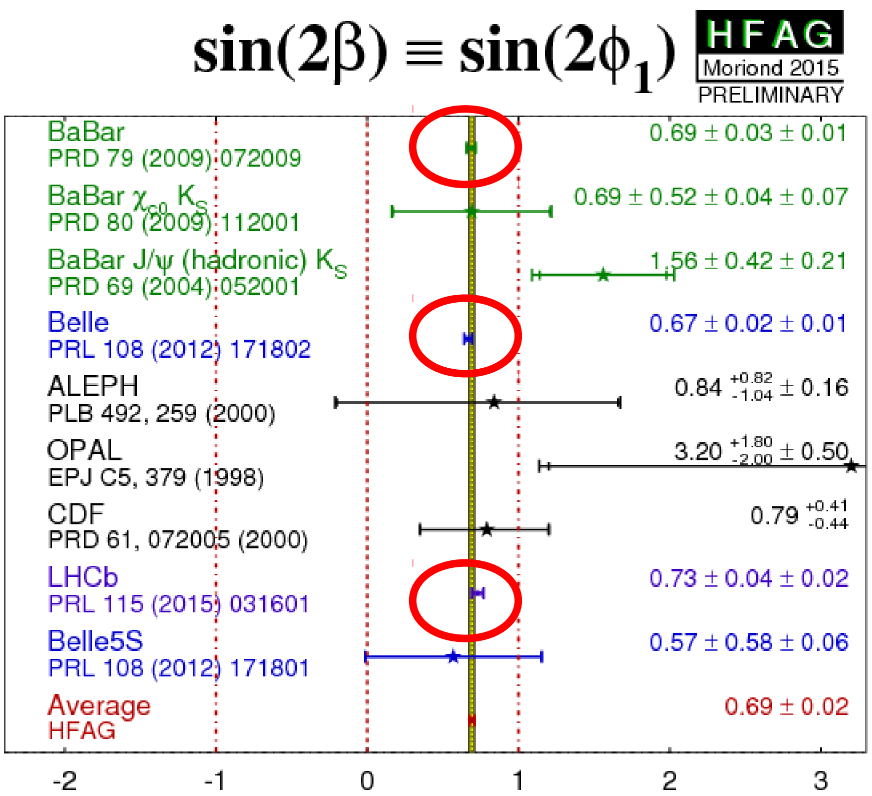


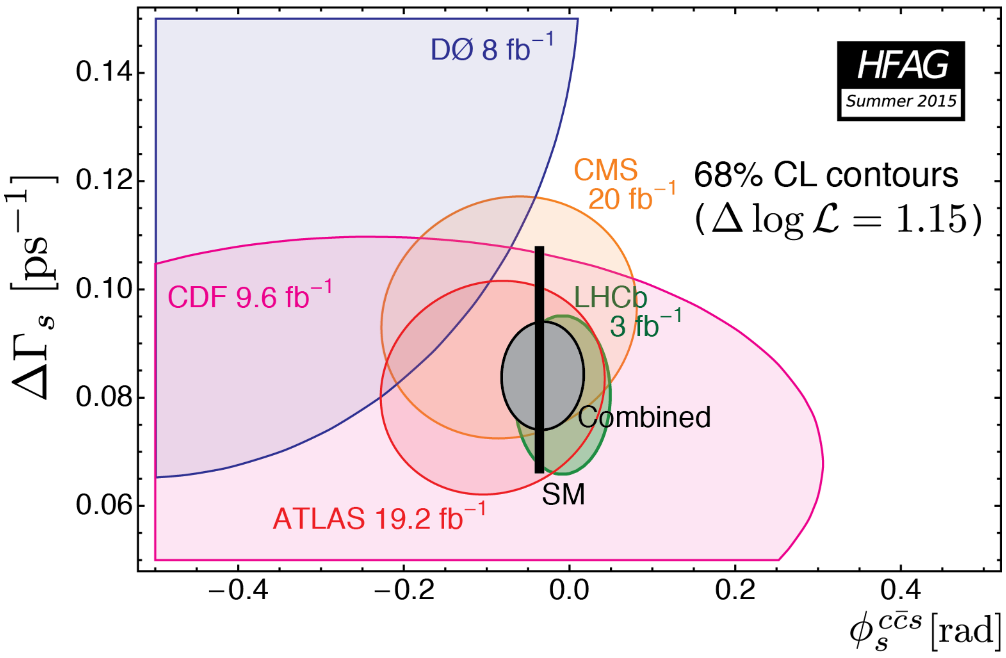


Much stronger constraints obtained with minimal assumption on CPV in decays

B^0 and B_s^0 mixing phases: sin(2β) & φ_s

PRL 115 (2015) 031601



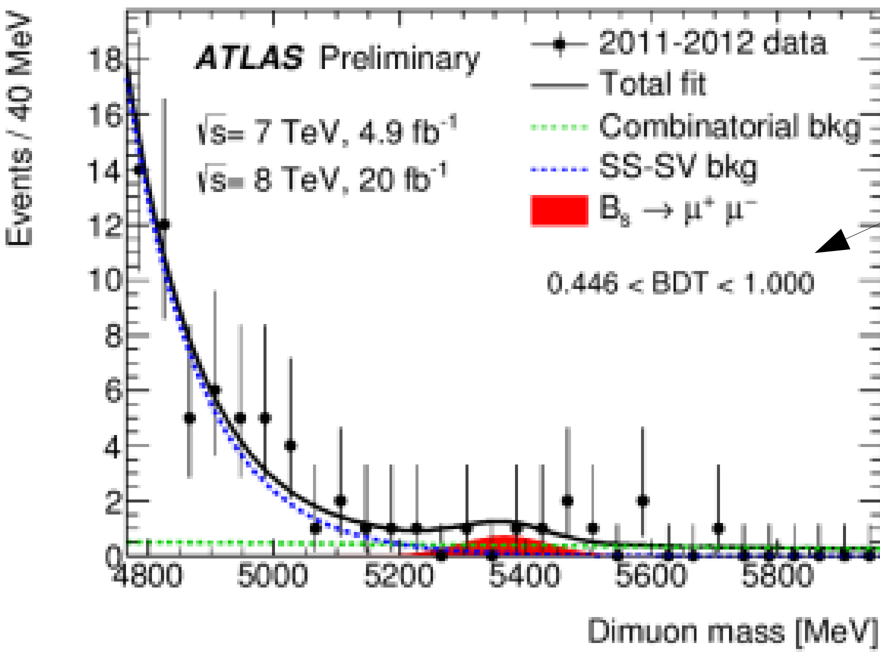


LHCb: PRL 114 (2015) 041801;
PL B736 (2014) 186;
ATLAS: arXiv:1601.03297;
CMS: PL B757 (2016) 97

Possible penguin pollution controlled by SU(3) partners
LHCb: PL B742 (2015) 38, JHEP 11 (2015) 082

$B_s \to \mu^+\mu^-$

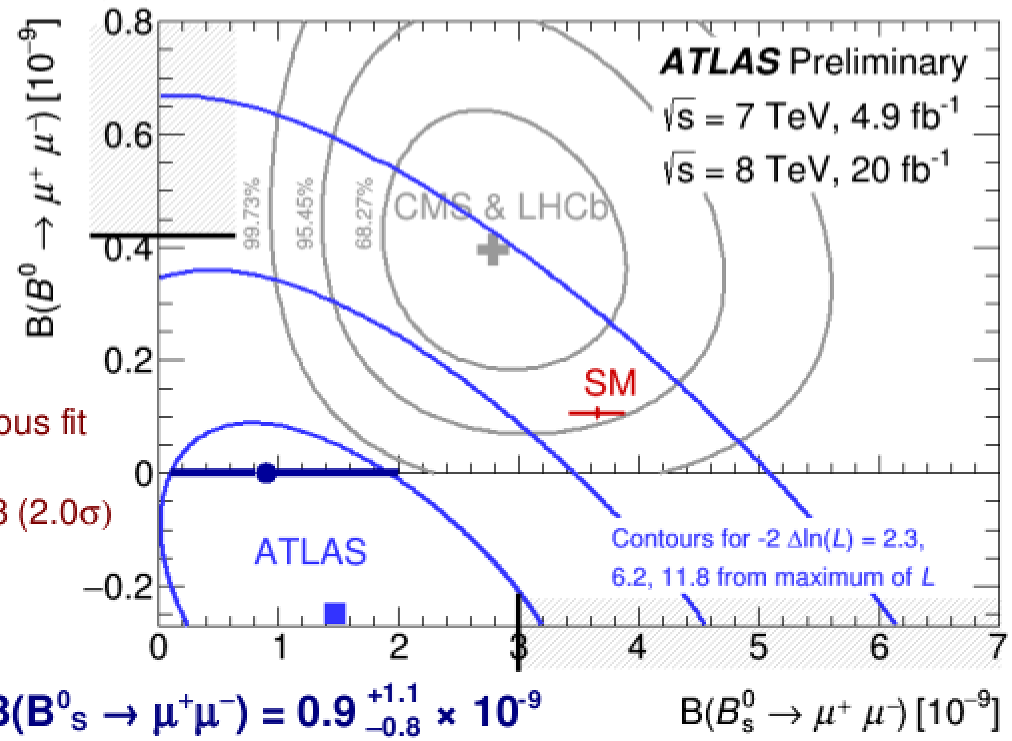
ATLAS preliminary
Moriond 2016



Cleanest of 3 BDT bins

Able to distinguish B^0 and B_s^0 peaks

$\mathcal{B}(B^0 \to \mu^+\mu^-) < 4.2 \times 10^{-10}$ at 95% CL



$\mathcal{B}(B^0_s \to \mu^+\mu^-) = 0.9^{+1.1}_{-0.8} \times 10^{-9}$

compatibility of the simultaneous fit with the SM:
p-value = 0.048 (2.0σ)

Sensitivity comparable to CMS and LHCb

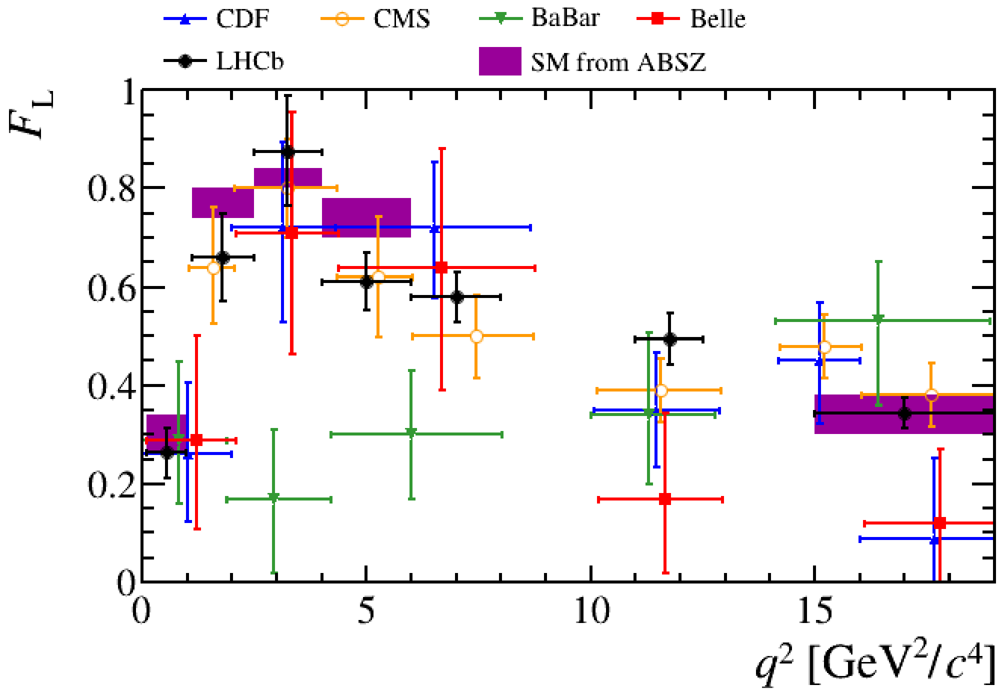
One to watch in Run 2

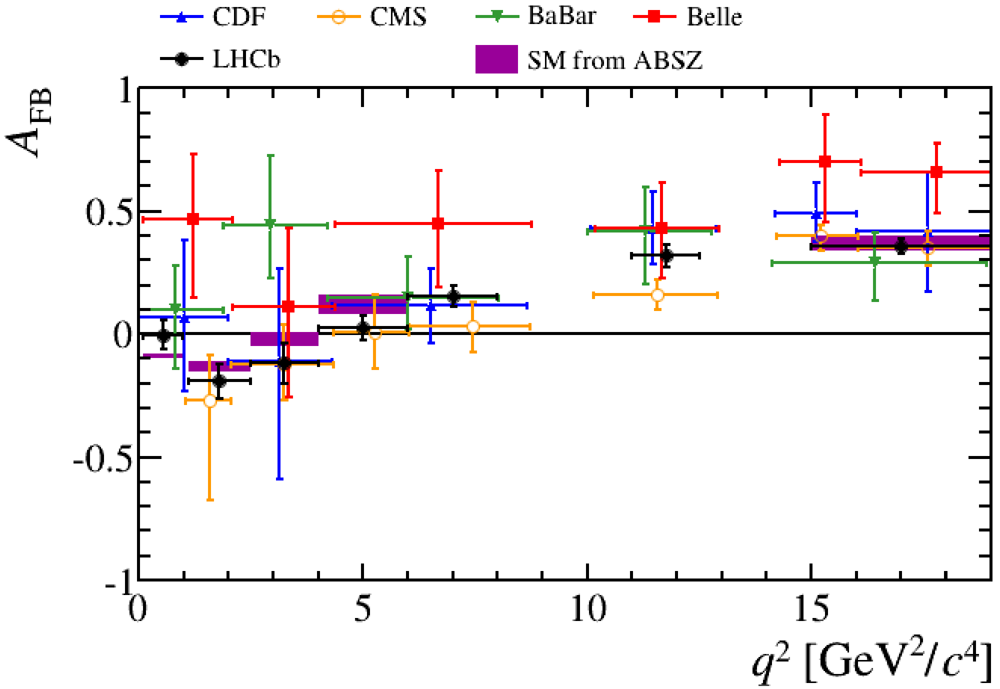
Full angular analysis of $B^0 \to K^{*0}\mu^+\mu^-$

JHEP 02 (2016) 104

Comparison to other experiments
(until now, only LHCb does a full angular analysis)

CMS (PLB 753 (2016) 424) quite competitive, especially at high q^2

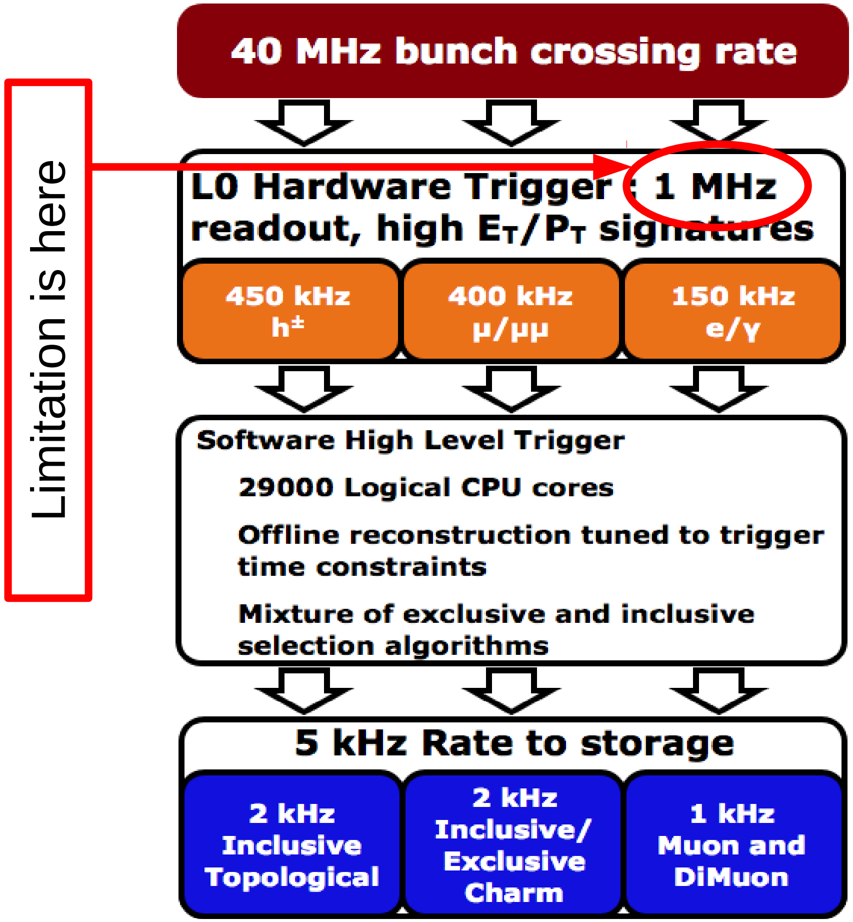




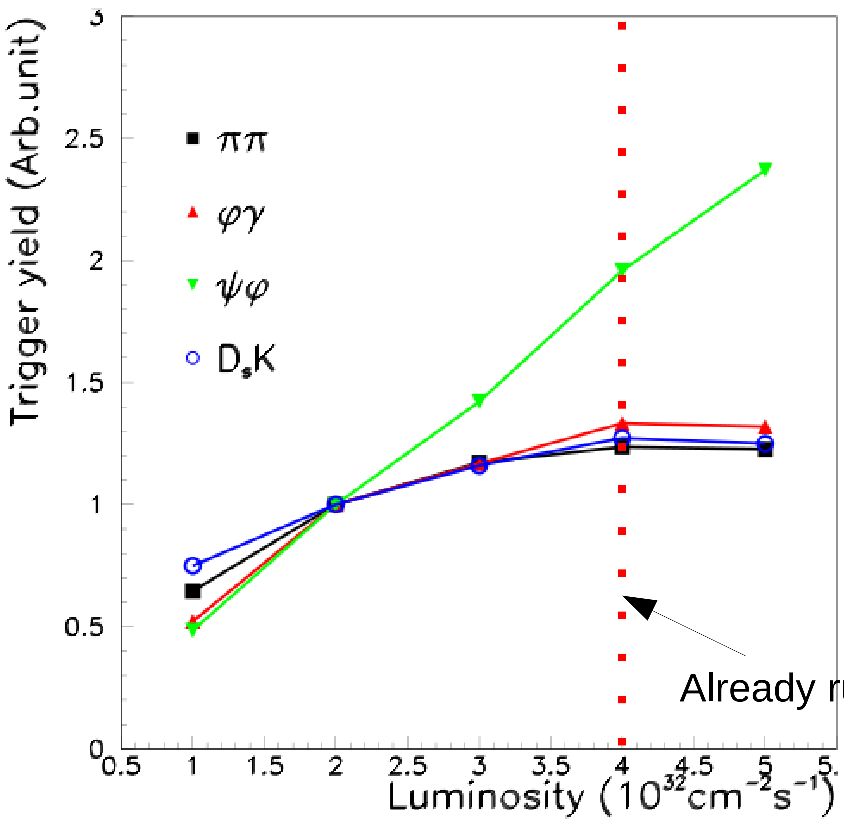
Beyond Run II – the LHCb Upgrade

- Beyond LHC Run II, the data-doubling time for LHCb becomes too long
  - Due to 1 MHz readout limitation and associated hardware (L0) trigger
- However, there is an excellent physics case to push for improved precision and an ever-broader range of observables
- Will upgrade the LHCb detector in the LHC LS2 (2018-20)
  - Upgrade subdetector electronics to 40 MHz readout
  - Make all trigger decisions in software
  - Operation at much higher luminosity with improved efficiency
    - order of magnitude improvement in precision (compared to today)
- Upgrade will be performed during LSII (now expected to be 2019-20)
  - Restart data taking in 2021 at instantaneous luminosity up to 2 10^{33}/cm^2/s
  - Upgrade detector qualified to accumulate 50/fb

LHC upgrade and the all important trigger

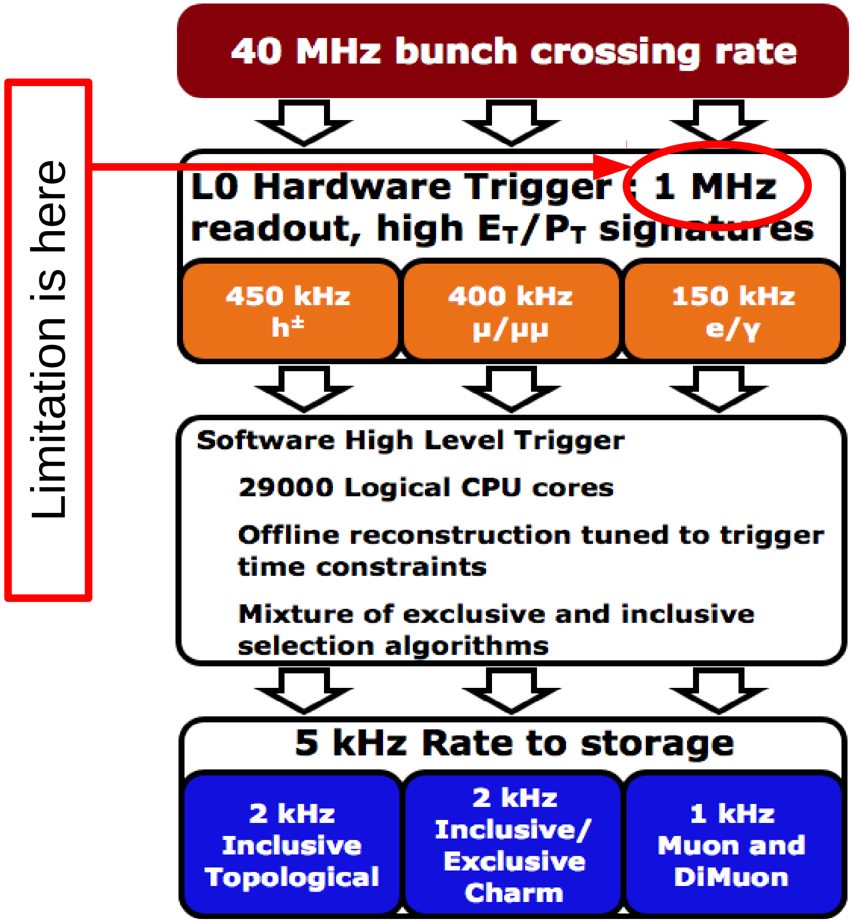


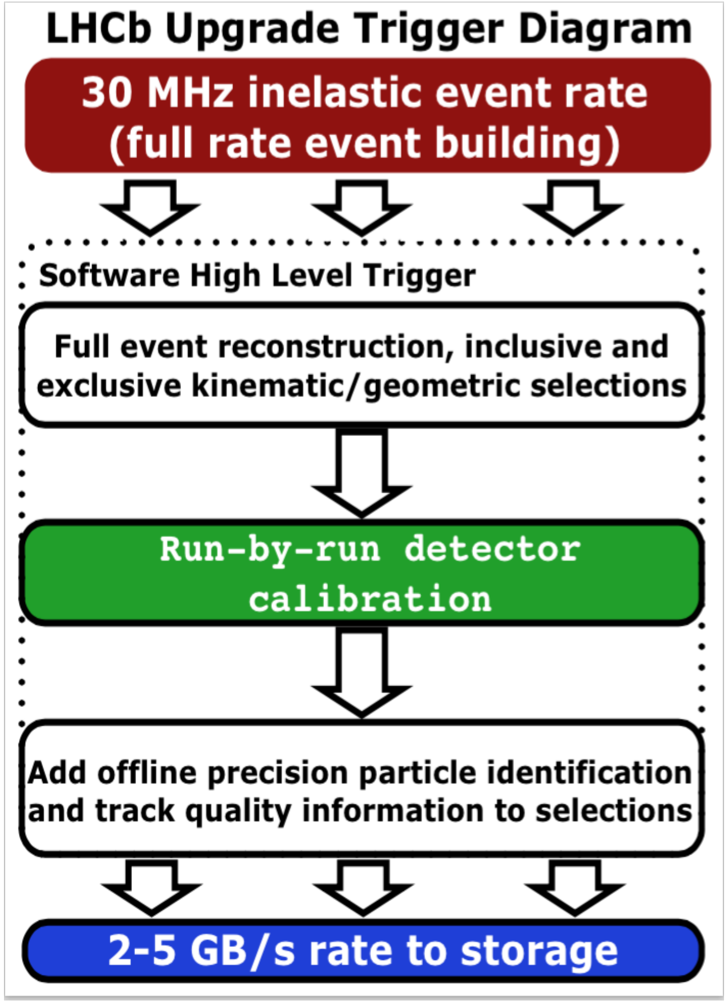
higher luminosity
→ need to cut harder at L0 to keep rate at 1 MHz
→ lower efficiency



- readout detector at 40 MHz
- implement trigger fully in software → efficiency gains
- run at L_{inst} up to 2 $10^{33}/cm^2/s$

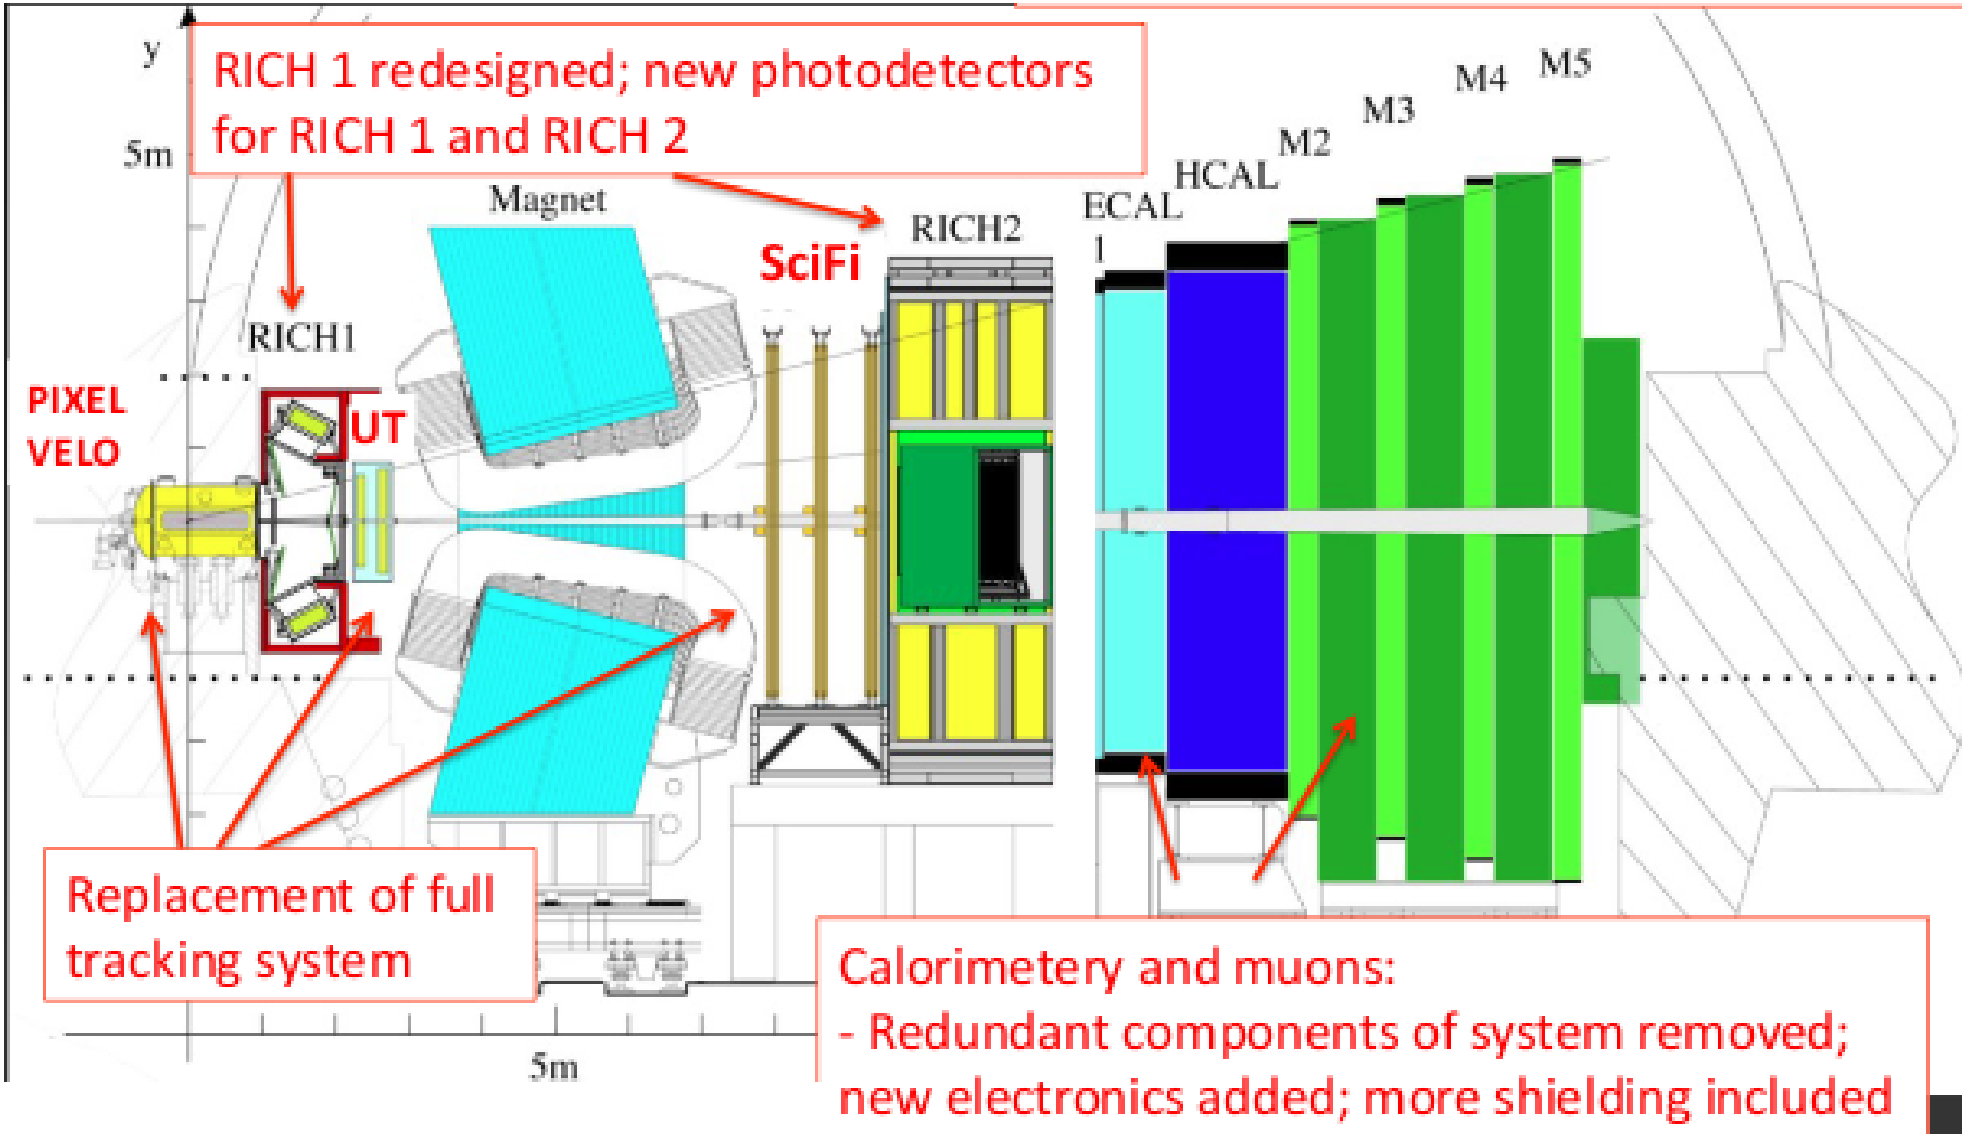
LHC upgrade and the all important trigger





- readout detector at 40 MHz
- implement trigger fully in software → efficiency gains
- run at L_{inst} up to 2 10^{33}/cm^2/s

LHCb detector upgrade



+ novel trigger and offline data management strategies

LHCb & upgrade sensitivities

Table 28: Statistical sensitivities of the LHCb upgrade to key observables. For each observable the expected sensitivity is given for the integrated luminosity accumulated by the end of LHC Run 1, by 2018 (assuming $5\,\text{fb}^{-1}$ recorded during Run 2) and for the LHCb Upgrade ($50\,\text{fb}^{-1}$). An estimate of the theoretical uncertainty is also given – this and the potential sources of systematic uncertainty are discussed in the text.

Type	Observable	LHC Run 1	LHCb 2018	**LHCb upgrade**	Theory
B_s^0 mixing	$\phi_s(B_s^0 \to J/\psi\,\phi)$ (rad)	0.050	0.025	**0.009**	~ 0.003
	$\phi_s(B_s^0 \to J/\psi\ f_0(980))$ (rad)	0.068	0.035	**0.012**	~ 0.01
	$A_{\rm sl}(B_s^0)$ (10^{-3})	2.8	1.4	**0.5**	0.03
Gluonic penguin	$\phi_s^{\rm eff}(B_s^0 \to \phi\phi)$ (rad)	0.15	0.10	**0.023**	0.02
	$\phi_s^{\rm eff}(B_s^0 \to K^{*0}\bar{K}^{*0})$ (rad)	0.19	0.13	**0.029**	< 0.02
	$2\beta^{\rm eff}(B^0 \to \phi K_S^0)$ (rad)	0.30	0.20	**0.04**	0.02
Right-handed currents	$\phi_s^{\rm eff}(B_s^0 \to \phi\gamma)$	0.20	0.13	**0.030**	< 0.01
	$\tau^{\rm eff}(B_s^0 \to \phi\gamma)/\tau_{B_s^0}$	5%	3.2%	**0.8%**	0.2 %
Electroweak penguin	$S_3(B^0 \to K^{*0}\mu^+\mu^-; 1 < q^2 < 6\,\text{GeV}^2/c^4)$	0.04	0.020	**0.007**	0.02
	$q_0^2\,A_{\rm FB}(B^0 \to K^{*0}\mu^+\mu^-)$	10%	5%	**1.9%**	$\sim 7\%$
	$A_{\rm I}(K\mu^+\mu^-; 1 < q^2 < 6\,\text{GeV}^2/c^4)$	0.09	0.05	**0.017**	~ 0.02
	$\mathcal{B}(B^+ \to \pi^+\mu^+\mu^-)/\mathcal{B}(B^+ \to K^+\mu^+\mu^-)$	14%	7%	**2.4%**	$\sim 10\%$
Higgs penguin	$\mathcal{B}(B_s^0 \to \mu^+\mu^-)$ (10^{-9})	1.0	0.5	**0.19**	0.3
	$\mathcal{B}(B^0 \to \mu^+\mu^-)/\mathcal{B}(B_s^0 \to \mu^+\mu^-)$	220%	110%	**40%**	$\sim 5\,\%$
Unitarity triangle angles	$\gamma(B \to D^{(*)}K^{(*)})$	7°	4°	**1.1°**	negligible
	$\gamma(B_s^0 \to D_s^{\mp}K^{\pm})$	17°	11°	**2.4°**	negligible
	$\beta(B^0 \to J/\psi\,K_S^0)$	1.7°	0.8°	**0.31°**	negligible
Charm *CP* violation	$A_\Gamma(D^0 \to K^+K^-)$ (10^{-4})	3.4	2.2	**0.5**	–
	ΔA_{CP} (10^{-3})	0.8	0.5	**0.12**	–
