

**Antonio Uras – IPN Lyon (France)**

for the ALICE, ATLAS, CMS  
and LHCb Collaborations

# Heavy Ions at HL-LHC

**Thanks to:** J. Jowett (LHC), J. Jia & A. Trzupek (ATLAS), A. Dainese (ALICE), M. Nguyen & Y.-J. Lee (CMS),  
G. Manca & L. Massacrier (LHCb)

- ❖ **LHC Luminosity evolution and Heavy-Ion running timeline**
- ❖ **Heavy ion physics program at HL-LHC**
- ❖ **Experiment upgrades and strategies**
- ❖ **A selection of performance studies**

# Heavy-Ion Physics: Why at the LHC?

❖ **The high-energy frontier:** large and long-living QGP, large cross-sections for hard probes. Vanishing net baryon density: Early Universe conditions

❖ **The low-energy frontier:** focus on bulk observables. Energy scan: search of the critical point and characterization of the phase transition

## Main upgrades relevant for the Heavy-Ion physics (LS2: 2019-2020)

- LHC collimator upgrades: target  $L \approx 6 \times 10^{27} \text{ cm}^{-2} \text{ s}^{-1}$  for Pb-Pb (i.e. 50 kHz int. rate)
- Major ALICE and LHCb upgrades, important upgrades for ATLAS and CMS
- Focus on rare probes, their coupling with QGP medium and (medium-modified) hadronization

## Heavy-Ions in LHC Run 2 (2015): [\[J.M. Jowett, M. Schaumann – IPAC2016, Busan, Korea\]](#)

- Pb-Pb collisions at 5.02 TeV per nucleon pair (c.m. energy of the 2013 p-Pb run)
- 18 days of operation for physics, design luminosity surpassed by a factor of 3.6
- Integrated luminosity of up to  $0.7 \text{ nb}^{-1}$  per experiment
- Specific bunch patterns providing Pb-Pb collisions in LHCb, for the first time

## Heavy-Ions in LHC Runs 3+4 (2021 →):

- ❖ Experiments request for Pb-Pb:  $L_{\text{int}} > 10 \text{ nb}^{-1}$  (ALICE Lol:  $10 \text{ nb}^{-1}$  with nominal solenoidal field +  $3 \text{ nb}^{-1}$  with reduced solenoidal field)
  - ✧ ×100 larger min. bias sample for ALICE w.r.t. Run 2
  - ✧ ×10 larger rare trigger sample for ATLAS/CMS w.r.t. Run 2
- ❖ pp reference, p-A. Investigating feasibility for lighter nuclei collisions

- ❖ **Jets: characterization of the energy loss mechanism, both as a testing ground for the multi-particle aspects of QCD and as a probe of the medium density**
  - Differential studies of jets, b-jets, di-jets,  $\gamma$ /Z-jet at very high  $p_T$  (main focus of ATLAS and CMS)
  - Flavor-dependent in-medium fragmentation functions (main focus of ALICE)
  
- ❖ **Heavy flavors: mass dependence of energy loss, study of in-medium thermalization and hadronization as a probe of the medium transport properties**
  - Low- $p_T$  production and elliptic flow of several HF hadron species, with first measurements of beauty at forward rapidity down to zero  $p_T$  (main focus of ALICE)
  - B hadrons and b-jets (main focus of ATLAS and CMS)
  - LHCb: performance under investigation

- ❖ **Quarkonium: precision study of quarkonium dissociation pattern and regeneration, as probes of deconfinement and of the medium temperature**
  - Low- $p_T$  charmonium production and its elliptic flow (main focus of ALICE)
  - Multi-differential studies of  $\Upsilon$  states (main focus of ATLAS and CMS)
  - LHCb: performance under investigation
  
- ❖ **Prompt dilepton production: (i) thermal radiation** to map temperature during system evolution; **(ii) modification of  $\rho$  meson spectral function** as a probe of the chiral symmetry restoration; **(iii) analysis of the continuum** to study low-mass Drell-Yan production and put limits on low-mass dark  $\gamma'/Z'$  boson production
  - Improved background rejection for prompt dielectrons and dimuons down to low- $p_T$  (ALICE)

## ❖ Detector specificities (strengthened with the upgrades):

- Hadron and lepton identification
- Light-weight and precise trackers
- Low magnetic field

Talk by P. Antonioli  
Saturday 8:30

## ❖ Main observables...

- Low- $p_T$  Heavy Flavors
- Low- $p_T$  Charmonium
- Prompt dileptons down to low-mass and low- $p_T$

ALICE Upgrade LOI + addendum: CERN-LHCC-2012-012,  
CERN-LHCC-2013-014

ALICE TPC Upgrade TDR: CERN-LHCC-2013-020

ALICE ITS Upgrade TDR: CERN-LHCC-2013-024

ALICE MFT TDR: CERN-LHCC-2015-001

ALICE Online-Offline Upgrade TDR: CERN-LHCC-2015-006

## ❖ ... are based on “untriggerable” signals!

- Record all events at up to 50 kHz in Pb-Pb (currently 0.5 kHz): strong data reduction needed (from 1 TB/s to 50 GB/s via online reconstruction)
- HL-HI-LHC: increase of minimum-bias sample  $\times 100$  w.r.t. Run 2

## New Inner Tracking System (ITS)

- New pixel technology: improved granularity and resolution, reduced material budget

## New Forward Muon Tracker (MFT)

- Vertex tracker for the forward muon spectrometer: heavy flavor vertices, prompt/displaced muon discrimination

## TPC Upgrade:

- Replacement of the MWPC-based readout by detectors employing GEMs to allow TPC operation in continuous mode

## Upgraded read-out for many detectors, new integrated Online-Offline (O<sup>2</sup>), new Fast Interaction Trigger detector

- Upgraded ALICE records Pb-Pb data at 50 kHz (< 0.5 kHz in Run I)

## ❖ CMS detector

- Lighter silicon tracker with extended coverage out to  $\eta = 4$
- GEM muon stations matching the  $\eta$  coverage of the tracker
- New high granularity calorimeter endcaps that together with the tracker will enable particle-flow reconstruction at large rapidity

## ❖ ATLAS detector

- Complete replacement of the internal tracker
- Level-I track trigger
- Calorimeter electronics upgrades
- Upgraded muon trigger system

**Main focus on triggerable signals (complementary strategy w.r.t. ALICE):**

muon, jet, displaced track triggers

- ✧ Trigger/DAQ approach: strong event recording reduction from 50 to 0.1 kHz
- ✧ HL-LHC: increase of sample  $\times 10$  w.r.t. Run 2

## ❖ Very successful participation to the 2013 p-Pb run. First Pb-Pb run in 2015!

- Detector performance and potential in heavy-ion (collider mode) will be clear after the analysis of the 2015 data

## ❖ Exploration of LHCb unique features: forward acceptance, vertexing, PID, calorimetry

- Cold nuclear matter effects on prompt/non-prompt quarkonia and open HF down to zero  $p_T$
- First observation of Z production in p-Pb

## ❖ SMOG system: LHCb data taking in fixed-target mode (currently unique at the LHC)

- Various gases can be injected.  $\sqrt{s_{NN}}$  up to  $\sim 100$  GeV
- To be continued after LS2 with possibly more noble gas species

## ❖ Upgrades (LS2) most relevant to Heavy-Ions:

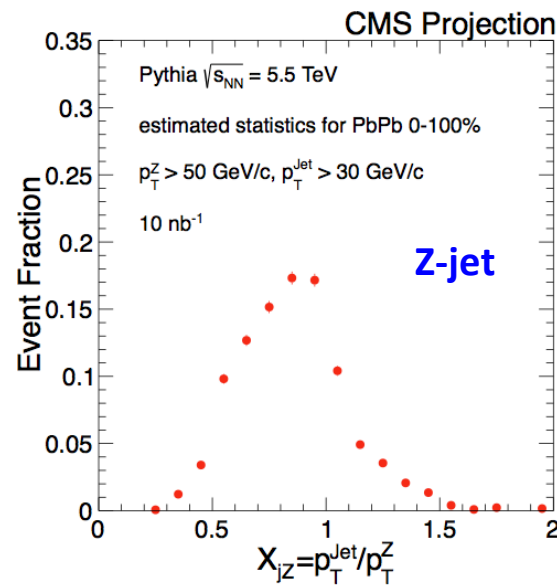

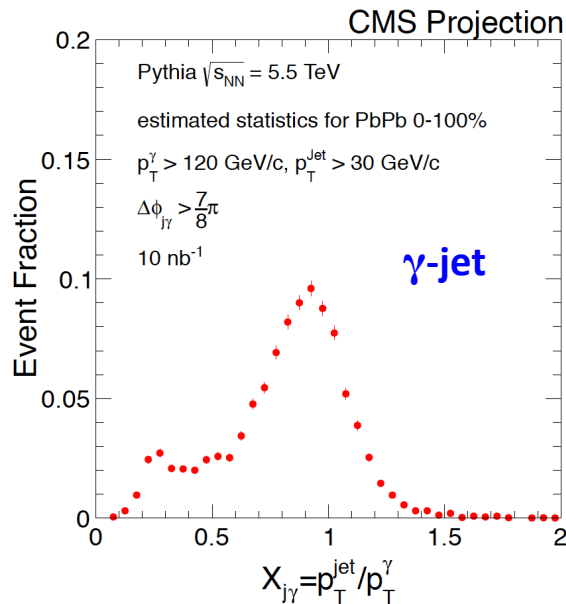

- New trackers (pixel, strip, scintillating fiber)
- Readout upgrade: exploiting full delivered p-Pb luminosity

- ❖ High precision  $\gamma$ -jet, Z-jet correlations ( $E^{\gamma/Z} = E^{\text{jet}}$  before medium effects), di-jets, with dedicated b-jet triggering
  - 10M di-jets with  $p_{T,1} > 120 \text{ GeV}/c$  (CMS,  $10 \text{ nb}^{-1}$ )
  - 140k b-jets with  $p_T > 120 \text{ GeV}/c$  (CMS,  $10 \text{ nb}^{-1}$ )
- ❖ Understand medium response and energy radiation details, map path-length dependence (radiative  $\sim L^2$ , collisional  $\sim L$ )

CMS Projection:  
CMS-PAS-FTR-13-025

❖ **Yield and elliptic flow in Heavy-Ion collisions** accessible at mid- and forward-rapidity for both charm and beauty sectors:

- **Central barrel:** prompt charm mesons/baryons; D mesons and  $J/\psi$  from B + full B reconstruction
- **Muon arm:** single muons from D;  $J/\psi$  from B + single muons from B

❖ **Baryon/meson ratio:** only available at mid-rapidity thanks to the upgraded ITS (upgrade especially needed for  $\Lambda_c \rightarrow pK\pi$  with  $c\tau \approx 60 \mu\text{m}$ )

**Improved discrimination of prompt/displaced dileptons thanks to the upgraded ITS (central dielectrons) and MFT (forward dimuons)**

- ❖ **Isolation of forward prompt  $J/\psi$**   
(not possible without the MFT)
- ❖ **S/B improvement for  $\psi(2S)$  in central Pb-Pb (dimuon channel)**  
by a factor 6-7

- ❖ **Isolation of medium-modified  $\rho$ ; thermal radiation from QGP**
- ❖ **Excellent performance in the dielectron channel with a dedicated low magnetic field (low- $p_T$  acceptance)**

# Light BSM Bosons from QGP: a Case for HL-LHC?

Light scalar or vector BSM bosons could be observed in **high-energy** (with large QGP volumes produced), **high-luminosity nuclear collisions**

J. Ellis & P. Salati, Nuclear Physics B342 (1990)

J. Davis & C. Böhm, arXiv:1306.3653

❖ **Resonance in the thermal dilepton production from the QGP** for masses up to  $3 \text{ GeV}/c^2$ : dilepton measurements in ALICE could set limits on quark- and lepton-couplings of light BSM bosons

❖ **Heavier bosons** would mainly decay into multiparticle states involving  $cc$  and  $\tau\tau$  pairs, and are **no longer detectable in the  $ee$  or  $\mu\mu$  channels**

❖ **ALICE: feasibility studies on dark photons of mass  $< 100 \text{ MeV}/c^2$**

[http://www.ge.infn.it/~ldma2015/presentations/wednesday-morning/05\\_gunji.pdf](http://www.ge.infn.it/~ldma2015/presentations/wednesday-morning/05_gunji.pdf)

❖ **“HL-HI-LHC” (Heavy-Ions in LHC Runs 3+4): fully exploit the potential of the machine as a high-luminosity HI collider**

- Pb-Pb  $> 10\text{nb}^{-1}$  : rare triggers  $\times 10$  w.r.t. Run 2 (CMS, ATLAS),  $\times 100$  for minimum bias (ALICE)
- pp reference at Pb-Pb energy; p-Pb; possibly light ions

❖ **Rich physics program being prepared by the experiments**

- Upgraded detectors and data acquisition systems to cope with the high interaction rate
- **ALICE:** focus on untriggerable probes by recording all events after online data volume reduction
- **CMS/ATLAS:** focus on triggerable probes with L1 and High-Level Triggers to reduce the rate of recorded events
- **LHCb:** potential for the HL-HI-LHC will be clear once the results of the 2015 Pb-Pb run are available

Backup Slides

# ALICE Muon Physics: Current Items

- **Low-mass dimuons.** Non-perturbative aspects of QCD through Dalitz and 2-body decays of light narrow resonances close to freeze-out. (Hidden) strangeness production. Thermal emission mediated by the broad vector meson  $\rho$  in the form  $\pi^+\pi^- \rightarrow \rho \rightarrow \mu^+\mu^-$
- **Quarkonium states.** Dissociation/recombination in the QGP phase (and in smaller systems?). Thermal charm production at low  $p_T$ . Test of perturbative QCD hadro-production mechanisms in pp collisions. Photo-production in ultra-peripheral heavy-ion “collisions”
- **Heavy-flavor single muons.** Energy loss and coupling of charm and beauty quarks with the deconfined medium
- **Single muons and dimuons from W/Z bosons.** Standard candle reference for in-medium effects. Probes of nucleons and nuclei parton structure

# ALICE Upgrade Strategy

- **ALICE will run at 50 kHz in Pb-Pb** (i.e.  $L = 6 \times 10^{27} \text{ cm}^{-2} \text{ s}^{-1}$ ) with minimum bias (pipeline) readout (max readout with present ALICE set-up:  $\approx 0.5 \text{ kHz}$ )
  - ❖ Gain a factor of 100 in statistics over current program:  **$\times 10$**  from the integrated luminosity ( $1 \text{ nb}^{-1} \rightarrow 10 \text{ nb}^{-1}$ ) and  **$\times 10$**  from the pipelined readout allowing inspection of all collisions. Inspect  $\mathcal{O}(10^{10})$  central collisions instead of  $\mathcal{O}(10^8)$
- **Improve vertexing and tracking at low  $p_T$** : better spatial resolution is needed on track reconstruction to improve secondary vertex reconstruction
- **This entails a major upgrade of the whole apparatus:**
  - ❖ New, smaller radius beam pipe
  - ❖ New inner tracking system: upgraded ITS + MFT
  - ❖ High-rate upgrade for the readout of the TPC, TRD, TOF, CALs, DAQ/HLT, Muons and Trigger detectors

ALICE

# ALICE Upgrade Strategy

## LHC roadmap: ion runs

$$\text{Run2} : \mathcal{L}_{integrated}^{Pb-Pb} = 1.0 \text{ nb}^{-1}$$

$$\text{Run3} : \mathcal{L}_{integrated}^{Pb-Pb} = 6.0 \text{ nb}^{-1}$$

$$\text{Run4} : \mathcal{L}_{integrated}^{Pb-Pb} = 7.0 \text{ nb}^{-1}$$

# MFT Upgrade Physics Program

**As a vertex tracker for the Muon Spectrometer**, the MFT will have a major impact on several items of the ALICE muon physics

## ➤ Open heavy flavors

- ❖ Charm measurement down to  $p_T = 1$  GeV/c in the single muon channel
- ❖ Beauty measurement down to  $p_T = 0$  in the non-prompt  $J/\psi$  channel

## ➤ Prompt Charmonium production

- ❖ Prompt/non-prompt  $J/\psi$  separation down to  $p_T = 0$
- ❖  $\psi(2S)$  measurement in central Pb-Pb collisions, down to  $p_T = 0$

## ➤ Low-mass dimuons

- ❖ Improved mass resolution for resonances
- ❖ Sensitivity to prompt continuum

## ➤ And also:

- ❖ Event plane measurement and azimuthal correlations at forward rapidity
- ❖ Isolation of any prompt signal involving  $p_T > 1$  GeV/c (Drell-Yan, limits on light BSM bosons?)

# Charm Measurement with Single Muons

## ➤ Systematic sources considered:

- Residual MFT-ITS misalignment
- MC assumption for the  $p_T$  distributions of HF muons
- Systematics on the description of the MFT response

➤ **Charm yield** accessible starting from  $p_T(\mu) = 1 \text{ GeV/c}$  (at least)

➤ **Important baseline** for charmonium measurements

## Beauty Measurement with non-prompt J/ψ

- **Prompt/displaced J/ψ discriminating variable:** longitudinal projection of the primary-secondary vertex distance considered for the analysis

$$t_z = \frac{(z_{J/\psi} - z_{\text{vtx}}) \cdot M_{J/\psi}}{p_z}$$

- **Analysis Strategy: double (possibly simultaneous) fit** on the dimuon invariant mass spectrum and the  $t_z$  distribution of the dimuons falling within the chosen J/ψ mass window
  - ❖ **The fit on the invariant mass spectrum** fixes the normalization of the background and the inclusive J/ψ signal. **The fit on the  $t_z$  distribution** then separates the two J/ψ contributions

# Non-prompt J/ψ: $t_z$ Template Fits

- **Weak  $p_T$  dependence of the  $t_z$  templates:** prompt/non-prompt J/ψ effective down to zero  $p_T$
- **Background template:** cross-check possible between mixed event technique and data-driven side-band method. Normalization fixed by the fit on the invariant mass spectrum

# Beauty Measurement with non-prompt J/ψ

- **Displaced/prompt separation** possible down to zero  $p_T(\text{J}/\psi)$  within 5% stat + syst uncertainties
- **Beauty  $R_{AA}$  measurement** possible down to zero  $p_T(\text{J}/\psi)$  within 7% stat + syst uncertainties even in central Pb-Pb

MFT TDR

❖ **Precision measurement for  $J/\psi$  at forward rapidity already in LHC Run 2, but:**

- No insight on  $\psi'$  physics in central Pb-Pb
- Only inclusive measurement available at forward rapidity

**MFT**

**PCA:** Point of Closest Approach between two muon tracks

**PCA Quality:** Estimates the probability that both muons are coming from the PCA

**Powerful tool to improve the S/B when the tracks have  $p_T > 1 \text{ GeV}/c$**

$$f_i(\vec{v}) = \exp \left[ -0.5(\vec{v} - \vec{r}_i)^T V_i^{-1} (\vec{v} - \vec{r}_i) \right]$$

where  $\vec{r}_i$  is the point of closest approach of track  $i$  to the point  $\vec{v}$ .  $V_i$  is the covariance matrix of the track  $i$  at  $\vec{r}_i$

Probability that the two tracks come from the same vertex  $\vec{v}$

$$P(\vec{v}) = \frac{2f_1(\vec{v})f_2(\vec{v})}{f_1(\vec{v}) + f_2(\vec{v})}$$

# Low Mass & Continuum Dileptons

- ❖ **Low and intermediate mass dileptons** both in the dielectron (mid rapidity) and dimuon (forward rapidity) channels
- ❖ Isolation of prompt sources needs **precise measurement of dilepton offset**
- ❖ In addition, **MFT will improve the mass resolution** for light resonances in dimuons

# Low Mass & Continuum Dileptons

- ❖ **Precise measurement of dilepton offset** to remove charm and  $\pi/K$  continuum
- ❖ **Dielectron channel advantaged** thanks to the excellent offset resolution of the upgraded ITS, but dedicated low magnetic field needed for low  $p_T$  acceptance
- ❖ Charm rejection strategy for the MFT must be optimized for the intermediate masses

## Other Items & Outlook

# Reaction Plane Measurement

ALI-SIMUL-96184

- ❖ **Excellent reaction plane resolution**, thanks to the high-granularity and the possibility to perform a standalone tracking (excluding contaminations from noisy clusters)

# Low-Mass Drell-Yan Measurement

**Low-mass ( $< 10 \text{ GeV}/c^2$ ) Drell-Yan lepton-pair production** at forward rapidity: important source of information on the partonic structure of protons

- ❖ Constraints on the gluon distribution and its nuclear dependence through the transverse momentum distributions
- ❖ Information about the onset of (gluon) saturation at small- $x$

**Drell-Yan: main source of prompt dimuons between  $J/\psi$  and  $\Upsilon$  at the LHC**

- Easily identifiable with a mass-offset combined fit on MFT-matched dimuons
- Due to the relatively large mass, a strong single- $\mu$   $p_T$  cut ( $p_T > 2 \text{ GeV}/c$ ) can be imposed to improve the quality of the sample

# Beyond Standard Model Searches?

- ❖ **A low-mass dark  $\gamma'$  or  $Z'$  will generate a resonant enhancement of the dilepton spectrum produced thermally by the QGP, at an energy corresponding to the dark gauge boson mass.**
- ❖ **Analysis recently proposed by D. Pagano on the Run2 data:** feasibility studies will start in the next weeks. First attempt in [arXiv:1306.3653](https://arxiv.org/abs/1306.3653) on the PHENIX data. ALICE already studies limits on light dark photon production below 100 MeV/c<sup>2</sup>

As a positive signal would appear

Exclusion plot for the q-l coupling

- ❖ **With the MFT:** rejection of non-prompt background (single- $\mu$  cut at 1.5 GeV/c should be affordable) and better mass resolution
