

# Operations until End of August

**3 July:** Beam-based alignment of all 14 low-beta RPs in 1½ hours, afterwards 45 minutes of diagnostic data taking in quiet beams with pots @ 6–8  $\sigma$

**4 July:** Loss maps with RPs in very conservative positions  
~ 30  $\sigma$  horizontally, ~ 20.5  $\sigma$  vertically  
still nominal TCL configuration: TCL5 in (i.e. intercepting all physics protons), TCL6 out

**5 – 14 July:** successful RP insertions in all intensity steps of 50 ns intensity ramp-up  
3, 50, 152, 296, 476 bunches per beam → lumi up to  $1.3 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$

**12 August:** New loss maps with RPs closer by 1 mm (without safety margin)  
but agreed positions for 25ns ramp-up still with 0.5 mm safety margin:  
~ 25  $\sigma$  horizontally, ~ 19.5  $\sigma$  vertically  
final TCL configuration: TCL5 out (i.e. diffractive protons reach RPs), TCL6 @ 25  $\sigma$

**13 – 21 August:** successful RP insertions in first part of 25 ns intensity ramp-up  
2, 86, 157, 219, 315 bunches per beam → lumi up to  $0.7 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$   
450 bunches: still missing (fills did not live long enough)

# Example Insertion in 50ns Beam (XRPH @ $\sim 30 \sigma$ )

Fill 3996: 476 bunches, lumi @ insertion:  $1.3 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$

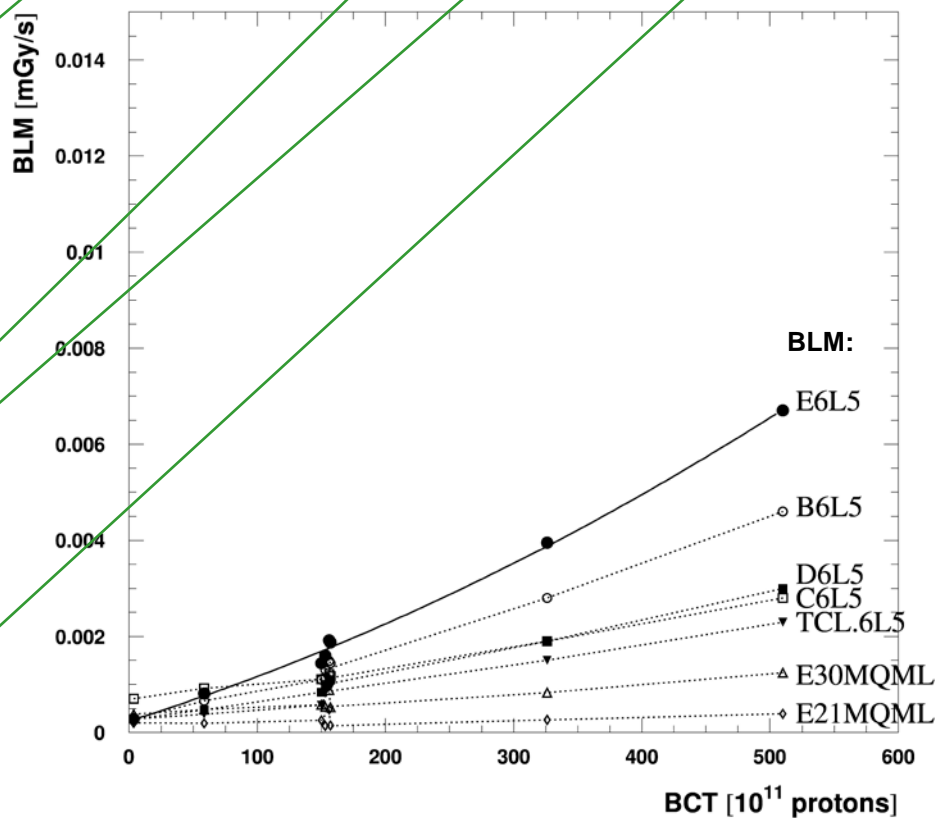

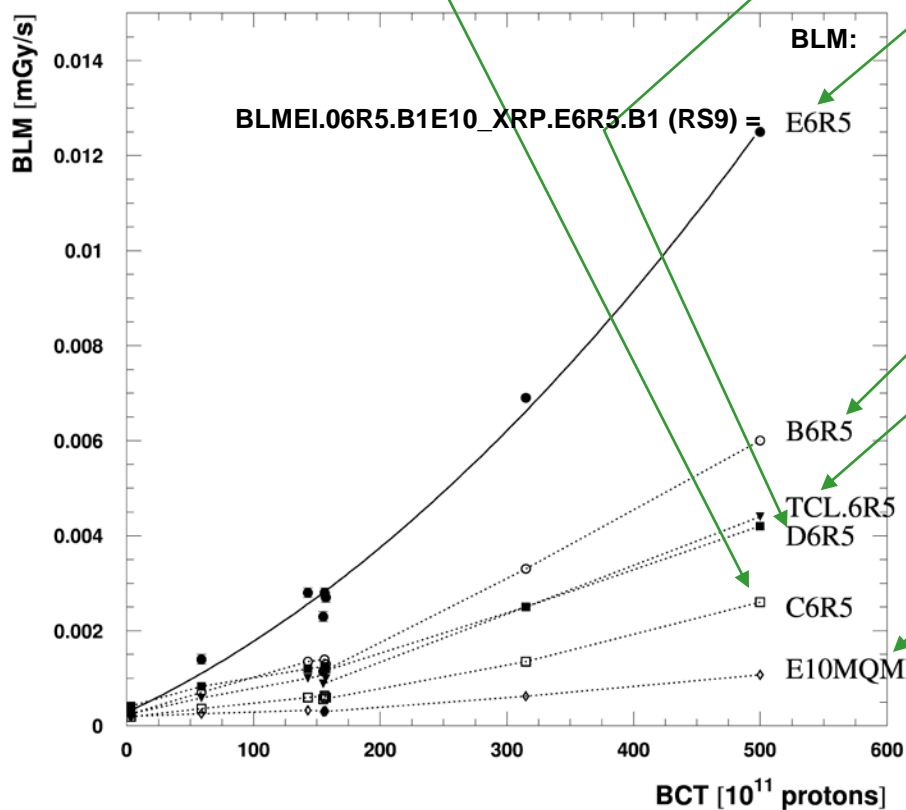

Timeseries Chart between 2015-07-14 00:23:04.191 and 2015-07-14 13:32:44.104 (LOCAL\_TIME)

Legend: BLMEI.06R5.B1E10\_XRP.B6R5.B1:LOSS\_RS09, BLMEI.06R5.B1E10\_XRP.C6R5.B1:LOSS\_RS09, BLMEI.06R5.B1E10\_XRP.D6R5.B1:LOSS\_RS09, BLMEI.06R5.B1E10\_XRP.E6R5.B1:LOSS\_RS09, BLMEI.06R5.B1E10\_XRP.L6R5.B1:LOSS\_RS09, BLMTI.06R5.B1E10\_TCL.6R5.B1:LOSS\_RS09, CMS:LUMI\_TOT\_INST, LHC.BCTDC.A6R4.B1:BEAM\_INTENSITY, TCL5R5.B1:MEAS\_MOTOR\_LU, TCL6R5.B1:MEAS\_MOTOR\_LU, XRPH.E6R5.B1:MEAS\_LVDT\_LU

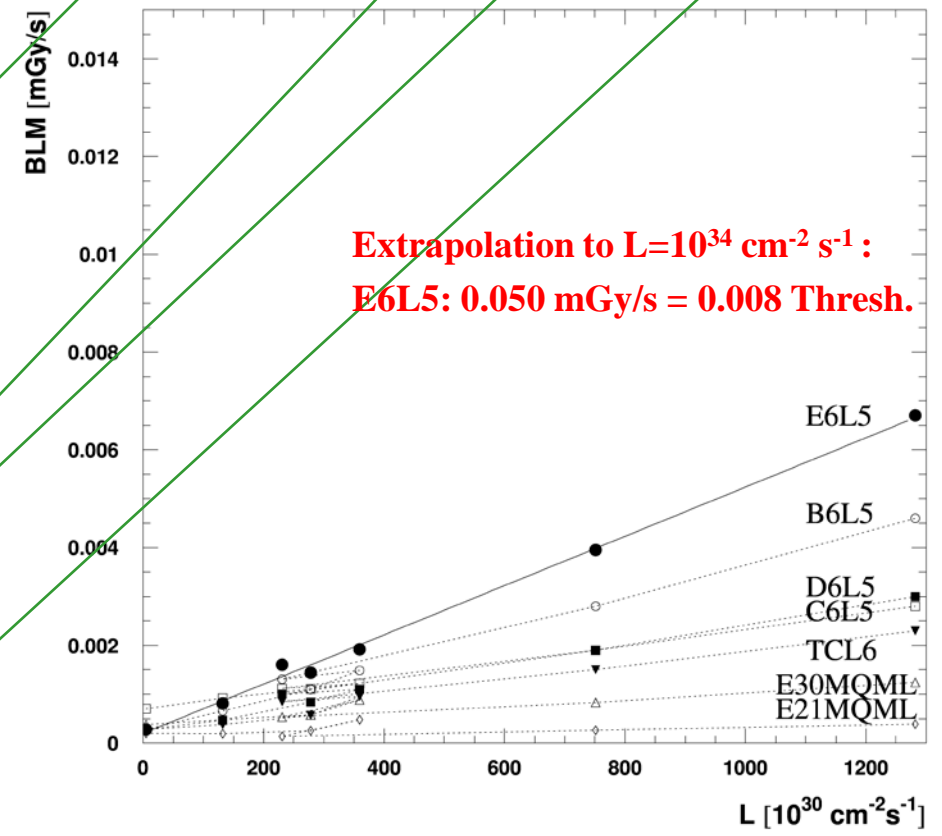

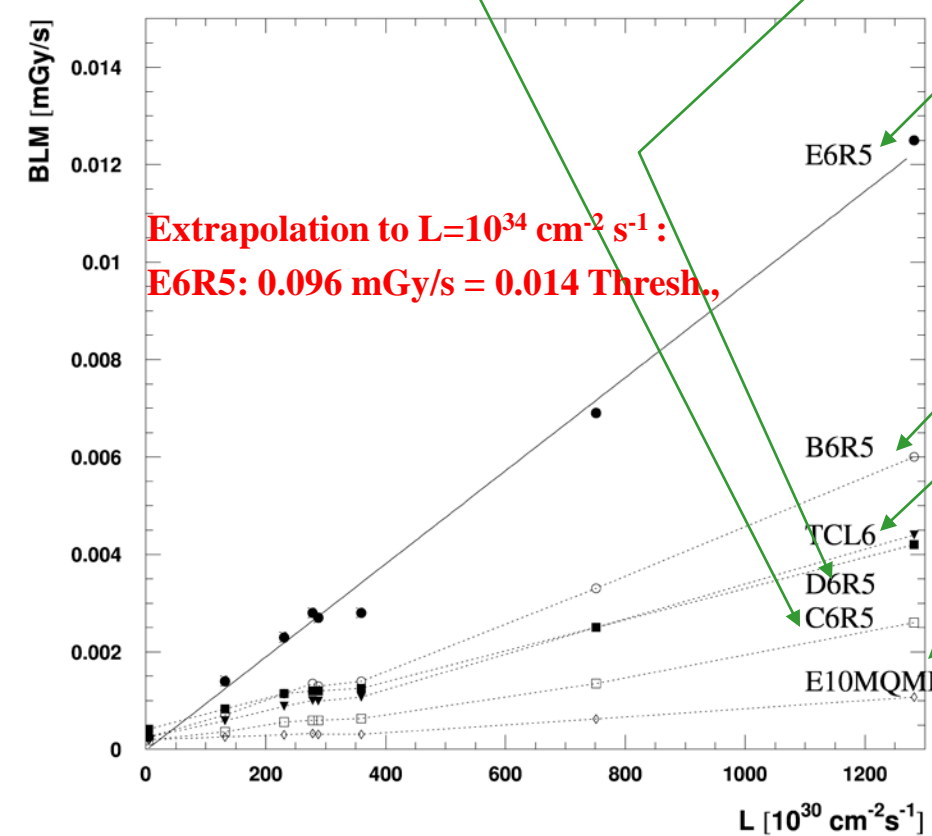

$\sim 1/3$  of XRP BLM rate comes from TCL5 (or further upstream)

# 50 ns Intensity Ramp: XRPH @ $\sim 30 \sigma$

Quadratic dependence on current  $\rightarrow$  try and plot vs. lumi

# 50 ns Intensity Ramp: XRPH @ $\sim 30 \sigma$

BLM dose rate linear with lumi  $\rightarrow$  collision debris, not single-beam background

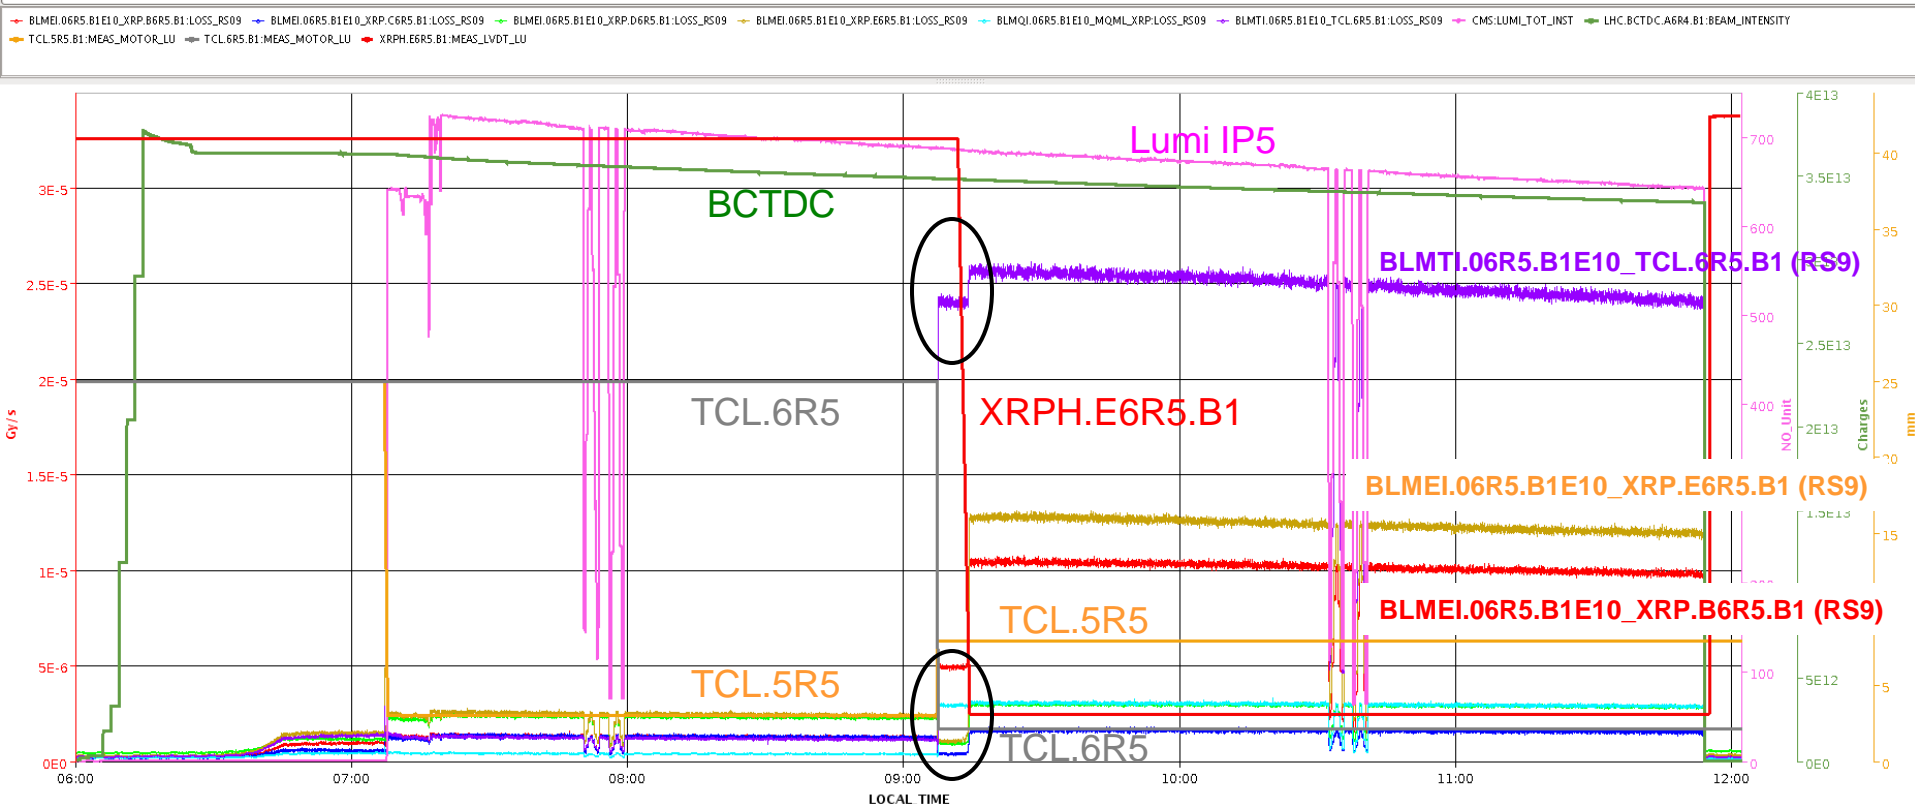

# Example Insertion in 25ns Beam (XRPH @ $\sim 25 \sigma$ )

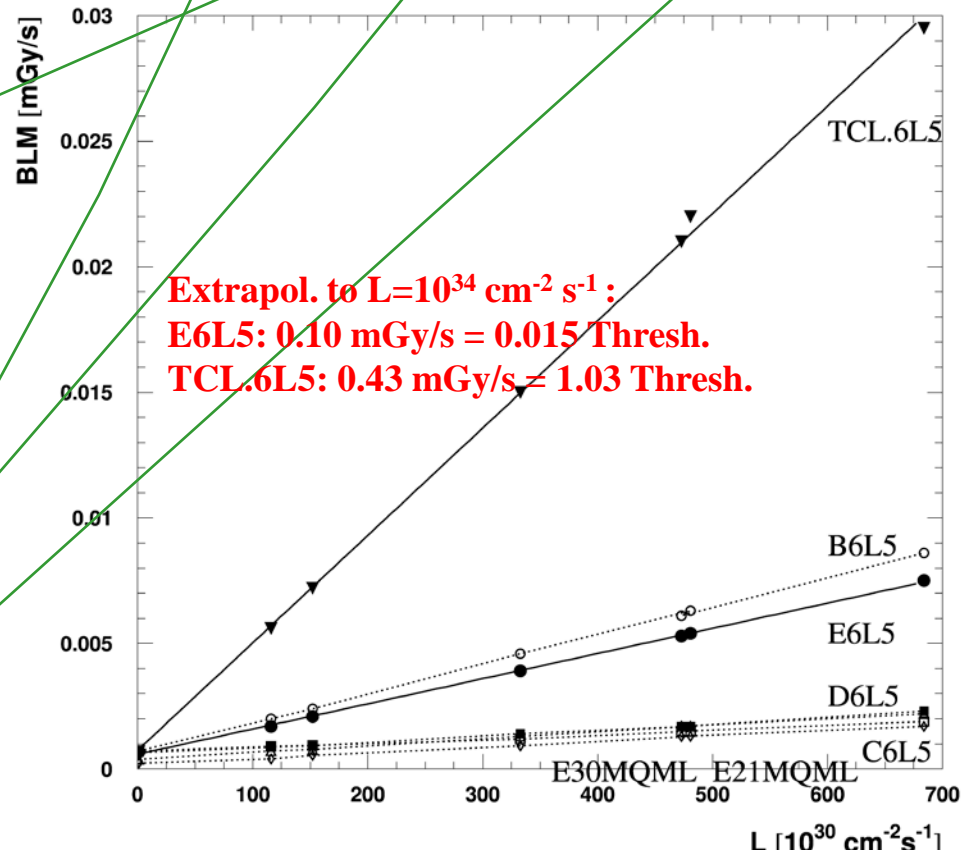

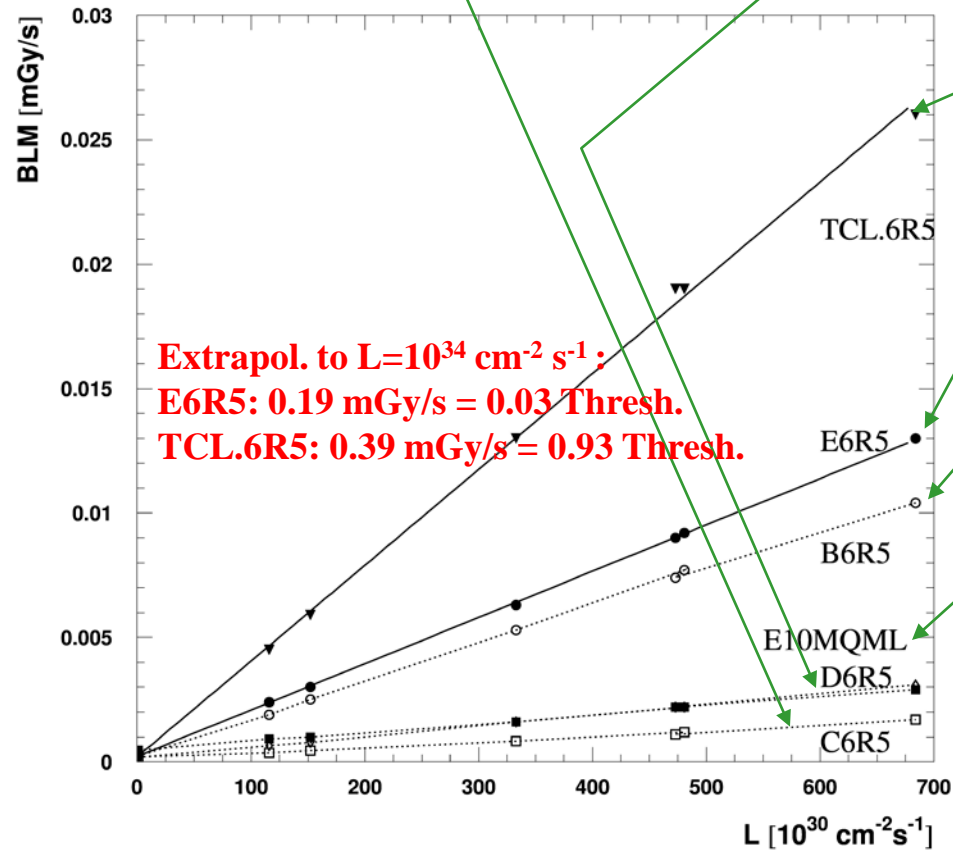

Fill 4243: 315 bunches, lumi @ insertion:  $0.7 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$

Timeseries Chart between 2015-08-21 04:20:37.624 and 2015-08-21 12:02:08.551 (LOCAL\_TIME)

- Retraction of TCL5  $\rightarrow$  rate decrease in all XRP BLMs except in the B6R5 BLM  $\rightarrow$  albedo from TCL6 ??
- BLM levels with: only TCL5 in, only TCL6 in, TCL6+XRP in  $\rightarrow$  disentangle contributions
- TCL6 BLM sees mainly the showers from TCL6, very small contrib. from XRPs

# 25 ns Intensity Ramp: XRPH @ $\sim 25 \sigma$

No data from BLMQI.06R5.B2I30\_MQML (on other beam, but very close to TCL6); still there ?

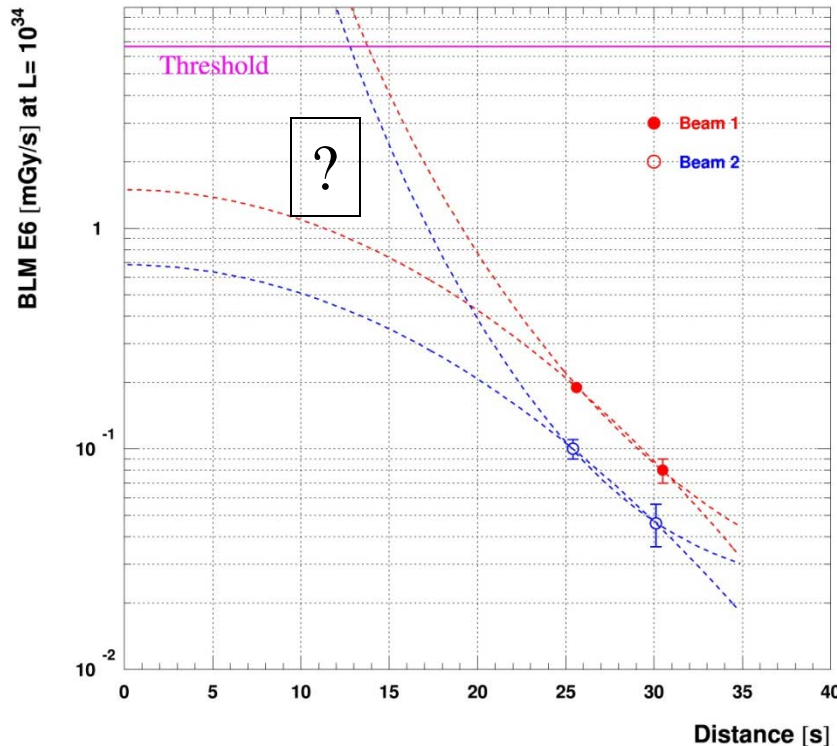

# Can we reach 20 $\sigma$ Distance ? (or even closer from 2016 on)

1. Extrapolate the 25  $\sigma$  and 30  $\sigma$  BLM data to  $L=10^{34}$   $\text{cm}^{-2} \text{s}^{-1}$  (see previous slides)
2. In 30  $\sigma$  data: remove TCL5 contribution, add background (losses with RP and TCL5 out)

**Problem: functional form? Only 2 points!**

Hypothesis: dominance by diffraction

$\rightarrow d\sigma/dx \sim 1/x + \text{background}$

Incompatible with the 2 points

Empirical parameterisation with  
 $1/x^n + \text{background}$

gives  $n = 5.8$  (B1),  $6.5$  (B2)

Or gaussian ? But why ?

**Very speculative  $\rightarrow$  more measurements needed**

## Strategy:

- A. Complete the 25ns intensity ramp-up to highest lumi,  
Measure BLM response at different distances: after automatic insertion retract in steps  
from 25  $\sigma$  to 50  $\sigma$   $\rightarrow$  more constraints for empirical extrapolation
- B. Direct measurement: If orbit reliability allows, remove (or reduce further) the 0.5 mm margin

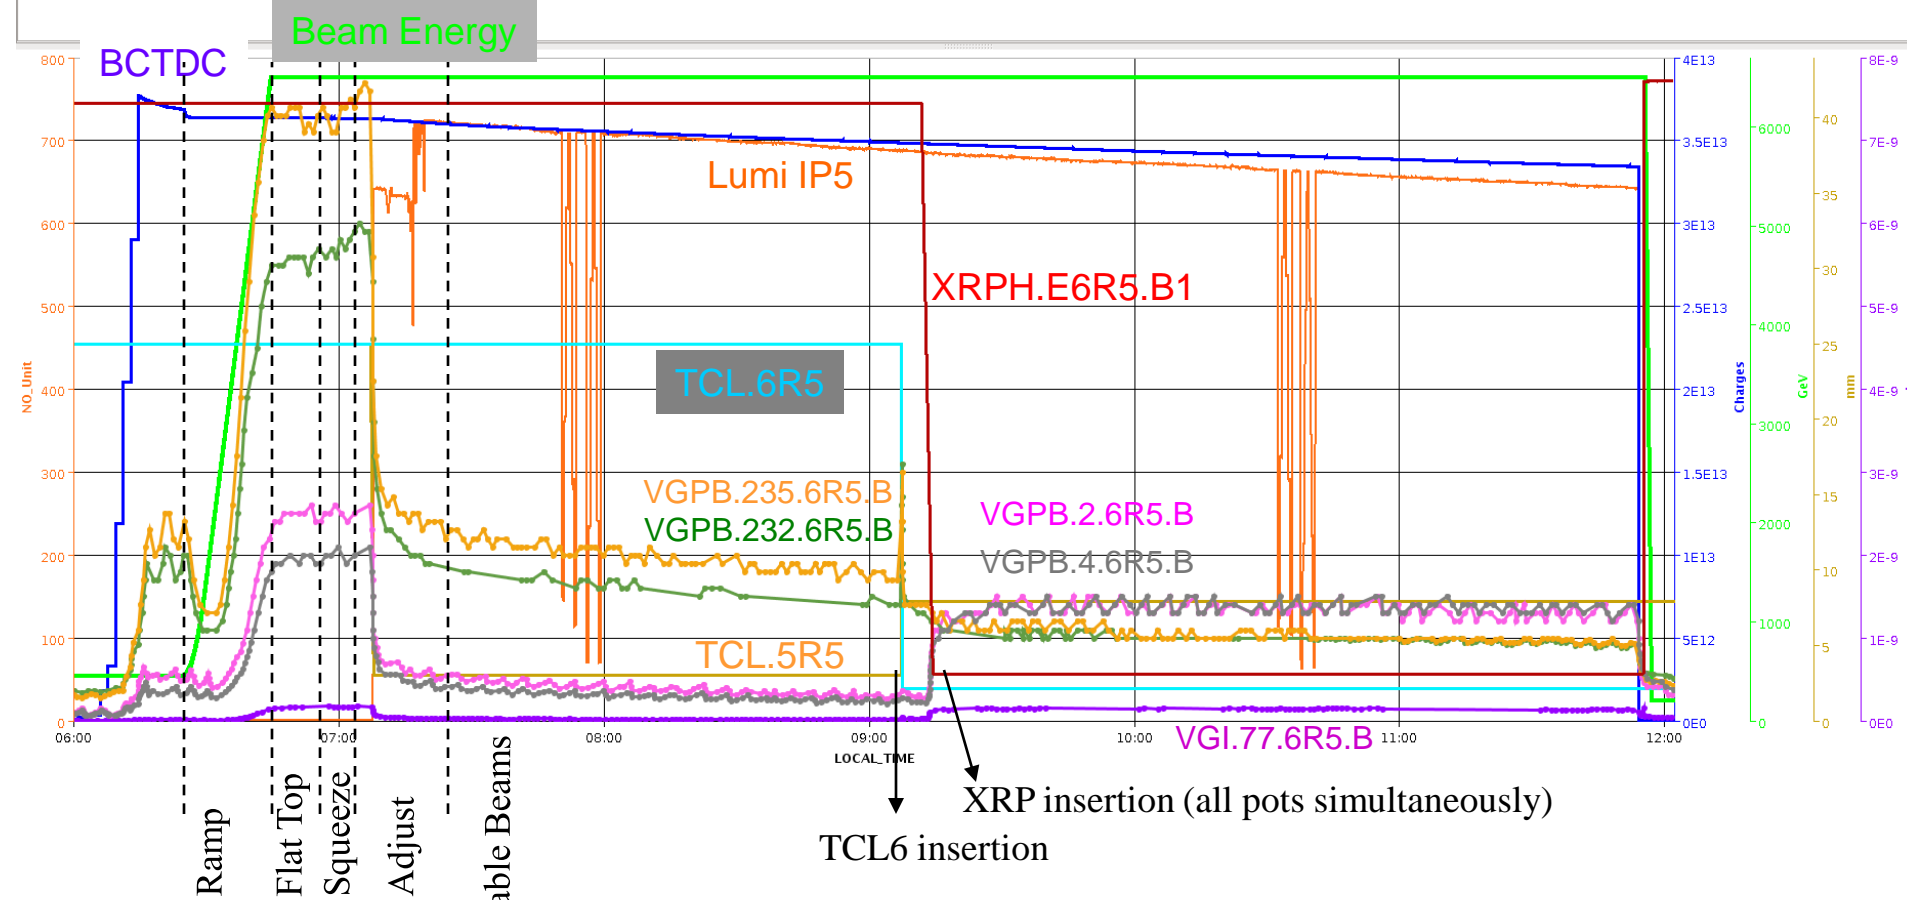

# Vacuum during a Fill with XRP Insertion

(Fill 4243, 25 ns Ramp, highest lumi of the series)

Timeseries Chart between 2015-08-21 04:20:37.624 and 2015-08-21 12:02:08.551 (LOCAL\_TIME)

Legend: CMS:LUMI\_TOT\_INST, LHC:BCTDC.A6R4.B1:BEAM\_INTENSITY, MSD:UA63.MKCB1.B1:E\_CHI, TCL5R5.B1:MEAS\_MOTOR\_LU, TCL6R5.B1:MEAS\_MOTOR\_LU, VGI.77.6R5.B.PR, VGPB.2.6R5.B.PR, VGPB.232.6R5.B.PR, VGPB.235.6R5.B.PR, VGPB.4.6R5.B.PR, XRPH.E6R5.B1:MEAS\_LVDT\_LU

# Vacuum in 50ns Intensity Ramp

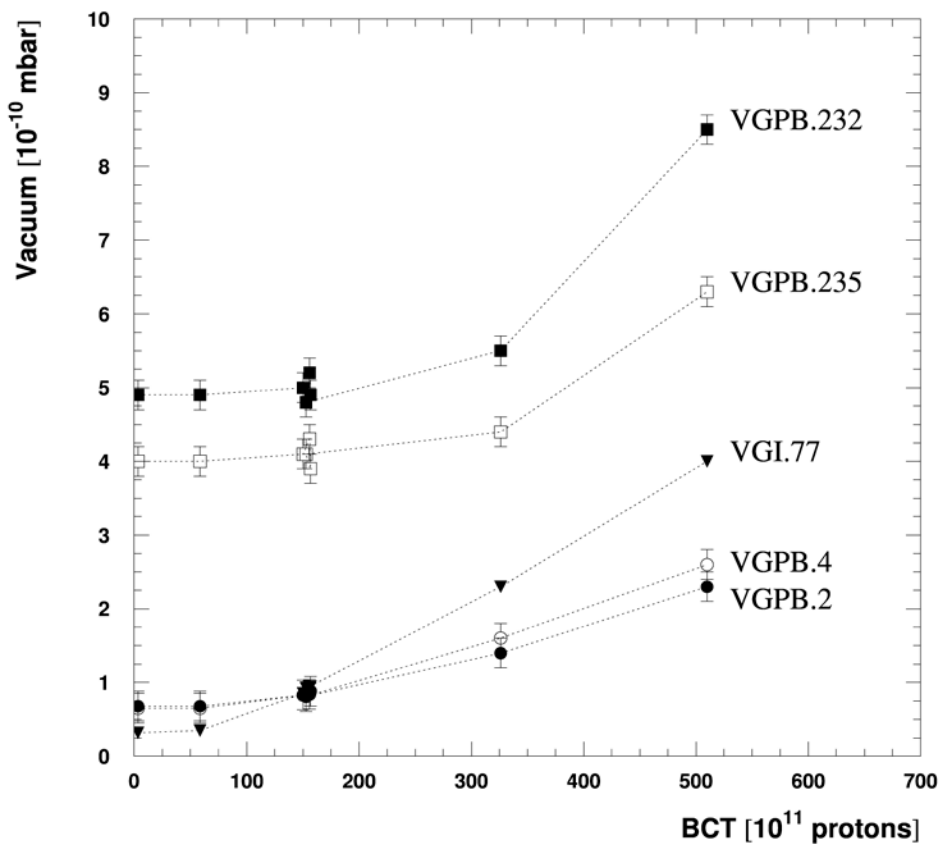

XRPH @  $\sim 30 \sigma$

Equilibrium pressure after RP insertion:

Beam 1, 50ns

Beam 2, 50ns

VGPB.232, VGPB.235: almost no effect from XRP insertion, but general pressure rise with beam current and lumi

# Vacuum in 25ns Intensity Ramp

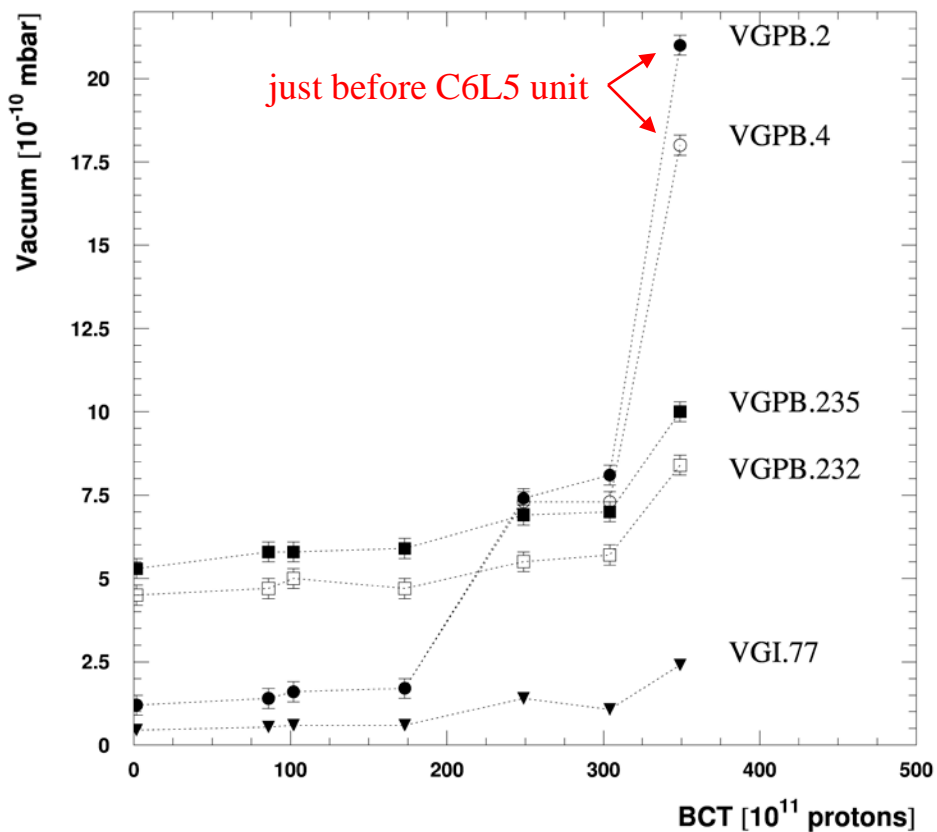

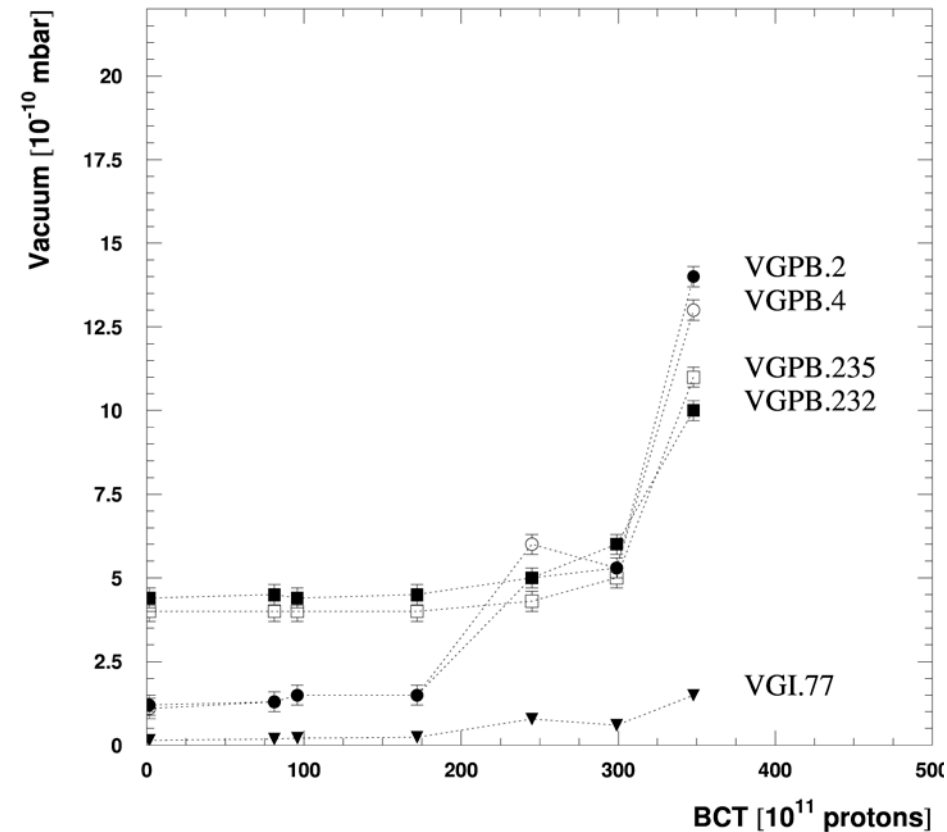

XRPH @  $\sim 25 \sigma$

Equilibrium pressure after RP insertion:

Beam 1, 25ns

Beam 2, 25ns

VGPB.232, VGPB.235: pressure rise with beam current, but not at XRP insertion

Functional dependence on current or lumi still unclear (non-linear in both)  $\rightarrow$  no extrapolation possible

**VGPB.2 and VGPB.4: very steep in last point  $\rightarrow$  do we have to worry ?**

# Temperatures during a Fill with XRP Insertion

(Fill 4243, 25 ns Ramp, highest lumi of the series)

Temperature rise [°C] from 9:15 to 11:15 :

	C6L5 (45-210-N)	E6L5 (cyl.)	C6R5 (56-210-N)	E6R6 (cyl.)
flange out	1.5	2.9 1.2	2.5	1.5
flange in	1.7			
in the pot	0 (cooled)	3.2 3.1 2.3 2.2	0 (cooled)	

no dramatic temperature rise  
in C6L5 at time of pressure rise

# Conclusions

- XRP BLMs do not indicate any show stopper for the 25ns intensity ramp with XRPH @  $25\sigma$
- MQML BLMs see almost nothing
- TCL6 BLMs will probably reach their thresholds at  $L = 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$
- Distances  $< 25 \sigma$  : study of BLM dose rate dependence on distance needed for extrapolation, then direct test
- Possible upcoming vacuum problem at higher intensities near C6 units, but no indications from temperatures  
→ in next intensity step consider sequential insertion:  
XRPH.E6 → XRPH.D6 → XRPH.C6 → XRPV.D6 → XRPV.C6
