Search for supersymmetry in events with two or more leptons in pp collisions at 13 TeV at CMS

Monday 4 July 2016 16:50 (20 minutes)

A search for supersymmetry is performed using events with two or more isolated leptons and jets in the final state using the CMS detector. Results are based on a sample of protonproton collisions at a centre-of-mass energy of 13 TeV at the LHC corresponding to an integrated luminosity of 2.3 fb⁻¹. Constraints are set on the gluino and sbottom pair production cross section; model independent limits and selection efficiencies are also provided for additional model testing.
