- ▶ PO beyond decays
- ▶ Conclusions

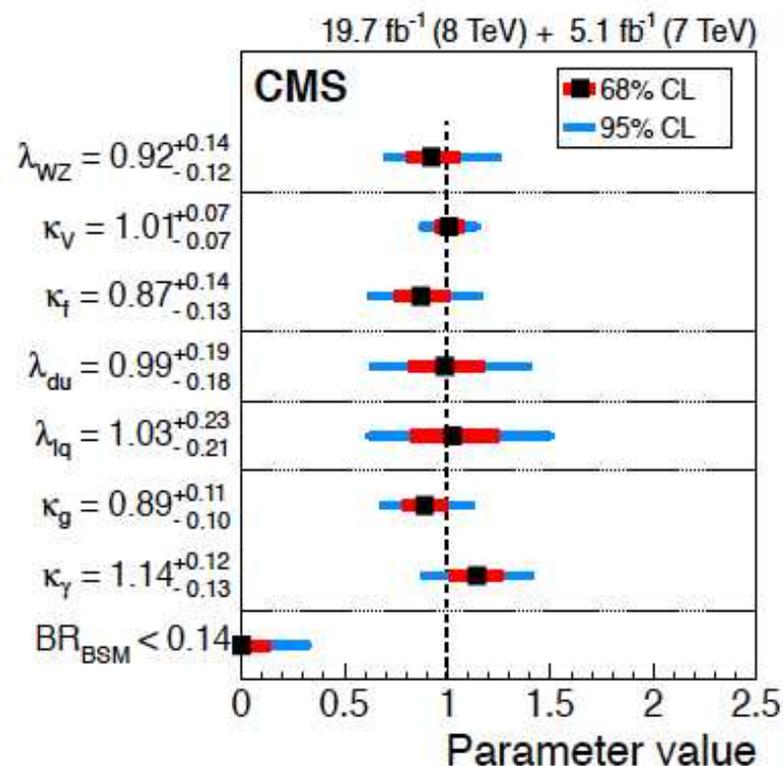

► Introduction

So far, possible non-standard properties of the Higgs boson (in process with a leading SM amplitude) have been analyzed from the experimental point of view using the so-called “kappa-formalism”:

$$\sigma(ii \rightarrow \mathbf{h} + \mathbf{X}) \times \text{BR}(\mathbf{h} \rightarrow ff) = \sigma_{ii} \frac{\Gamma_{ff}}{\Gamma_h} = \frac{\kappa_{ii}^2 \kappa_{ff}^2}{\kappa_h^2} \sigma_{\text{SM}} \times \text{BR}_{\text{SM}}$$

Main virtues:

- **Clean SM limit** [best up-to-date TH predictions recovered for $\kappa_i \rightarrow 1$]
- **Well-defined both on TH and EXP sides**
- **(almost) Model independent**

► Introduction

So far, possible non-standard properties of the Higgs boson (in process with a leading SM amplitude) have been analyzed from the experimental point of view using the so-called “kappa-formalism”:

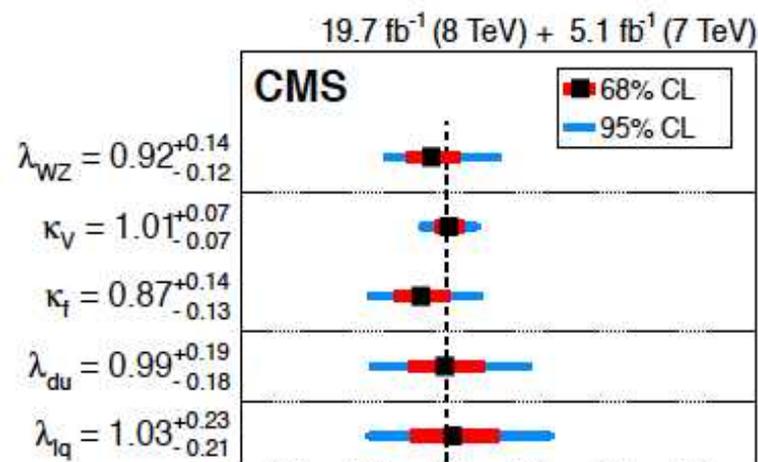

$$\sigma(ii \rightarrow \mathbf{h} + \mathbf{X}) \times \text{BR}(\mathbf{h} \rightarrow ff) = \sigma_{ii} \frac{\Gamma_{ff}}{\Gamma_h} = \frac{\kappa_{ii}^2 \kappa_{ff}^2}{\kappa_h^2} \sigma_{\text{SM}} \times \text{BR}_{\text{SM}}$$

Main virtues:

- **Clean SM limit** [best up-to-date TH predictions recovered for $\kappa_i \rightarrow 1$]
- **Well-defined both on TH and EXP sides**
- **(almost) Model independent**

Main problem:

- **Loss of information** on possible NP effects modifying the **kinematical distributions**

N.B.: easy to conceive NP effects showing up mainly in kin. effects rather than in total rates (e.g. CPV)

► Introduction

So far, possible non-standard properties of the Higgs boson (in process with a leading SM amplitude) have been analyzed from the experimental point of view using the so-called “kappa-formalism”:

$$\sigma(ii \rightarrow \mathbf{h} + \mathbf{X}) \times \text{BR}(\mathbf{h} \rightarrow ff) = \sigma_{ii} \frac{\Gamma_{ff}}{\Gamma_{\mathbf{h}}} = \frac{\kappa_{ii}^2 \kappa_{ff}^2}{\kappa_{\mathbf{h}}^2} \sigma_{\text{SM}} \times \text{BR}_{\text{SM}}$$

Main virtues:

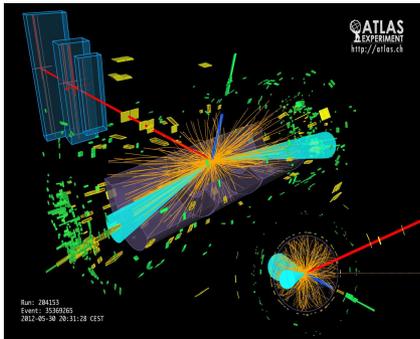

- **Clean SM limit** [best up-to-date TH predictions recovered for $\kappa_i \rightarrow 1$]
- **Well-defined both on TH and EXP sides**
- **(almost) Model independent**

Main problem:

- **Loss of information** on possible NP effects modifying the **kinematical distributions**

We need to identify a larger set of “pseudo-observables” able to characterize NP in the Higgs sector in general terms

General comments about Pseudo Observables

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi}\not{D}\psi + \text{h.c.} \\ & + \chi_i y_{ij} \chi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$

Experimental data

raw data,
fiducial cross-sections,
...

Pseudo Observables

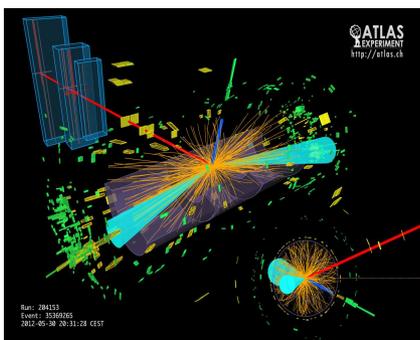

masses, widths,
slopes, ...

Lagrangian parameters

Wilson coefficients,
renormalization scale,
running masses, ...

► General comments about PO

- The goal of the PO is to provide a general encoding of the exp. results in terms of a limited number of “simplified” (idealized) observables of easy th. interpretation [*old idea - heavily used and developed at LEP times*]
- The experimental determination of an appropriate set of PO will “help” and not “replace” any explicit NP approach to Higgs physics (*including the EFT*)

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi}\not{D}\psi + \text{h.c.} \\ & + \chi_i y_{ij} \chi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$

Experimental data

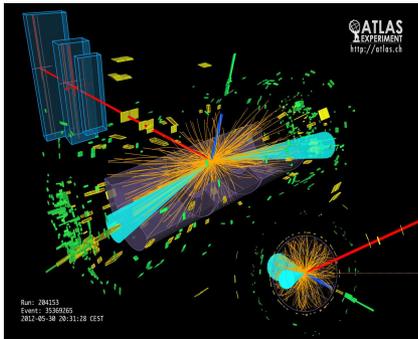

Pseudo Observables

Lagrangian parameters

The PO can be computed in terms of Lagrangian parameters in any specific th. framework (SM, SM-EFT, SUSY, ...)

► General comments about PO

- The goal of the PO is to provide a general encoding of the exp. results in terms of a limited number of “simplified” (idealized) observables of easy th. interpretation [*old idea - heavily used and developed at LEP times*]
- The experimental determination of an appropriate set of PO will “help” and not “replace” any explicit NP approach to Higgs physics (*including the EFT*)

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi + \text{h.c.} \\ & + \chi_i y_{ij} \chi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$

- The PO should be defined from kinematical properties of on-shell processes (*no problems of renormalization, scale dependence, ...*)
- The theory corrections applied to extract them should be universally accepted as “NP-free” (*soft QCD and QED radiation*)

► General comments about PO

Example I: The mass of a particle is a PO

Not always obvious how to extract it from data (\rightarrow *debate on Z line-shape*) and how to make it in a way that is useful for theoreticians (\rightarrow *top mass*).

The M_Z , M_W , M_h , determined by experiments are **3 well-defined PO** and not fundamental couplings of the SM Lagrangian (or BSM models)

Either we predict them (*at a certain order*) in terms of other couplings or we use them to extract the couplings (*at a given order and at a given scale....*). This does not affect their experimental determination, while the way they are defined from data affect the way we compute them.

► General comments about PO

Example II: The effective couplings of the Z boson

Parametrise the $Z \bar{f} f$ vertex as $\gamma_\mu (G_V^f + G_A^f \gamma_5)$

$$\Gamma_f \equiv \Gamma(Z \rightarrow f \bar{f}) = 4 c_f \Gamma_0 (|G_V^f|^2 R_V^f + |G_A^f|^2 R_A^f) + \Delta_{\text{EW/QCD}}$$

Radiators: final state radiation

non-factorizable corrections,
very small.

Bardin, Grunewald, Passarino, '99

The pseudo-observables are defined as

$$g_V^f = \text{Re } G_V^f, \quad g_A^f = \text{Re } G_A^f$$

To be model-independent it is important to work with **on-shell initial and final states**.

Then a theorist can take their model, or their EFT,
compute the contribution to these POs, and obtain the constraints on the model.

► General comments about PO

There are two main categories:

A) “Ideal observables”

$M_W, \Gamma(Z \rightarrow ll), \dots$

$M_h, \Gamma(h \rightarrow \gamma\gamma), \Gamma(h \rightarrow 4\mu), \dots$

but also $d\sigma(pp \rightarrow hZ)/dm_{hZ} \dots$

B) “Effective on-shell couplings”

g_Z^f, g_W^f, \dots

This is the category we want to “extend” in order to describe non-standard effects in the Higgs sector

- Both categories are useful
(*there is redundancy having both, but that's not an issue...*).
- For B) one can write an effective Feynman rule, not to be used beyond tree-level

► PO in Higgs decays

Multi-body modes

e.g. $h \rightarrow 4\ell, \ell\ell\gamma, \dots$

There is more to extract from data other than the κ_i

Two-body (on-shell) decays

[no polarization properties of the final state accessible]

e.g. $h \rightarrow \gamma\gamma, \mu\mu, \tau\tau, bb$

The κ_i ($\leftrightarrow \Gamma_i$) is all what one can extract from data

[+ one more parameter if the polarization is accessible]

► PO in Higgs decays

Multi-body modes

e.g. $h \rightarrow 4\ell, \ell\ell\gamma, \dots$

Form factors $\rightarrow f_i(\mathbf{s})$ [E.g.: $s = m_{\ell\ell}^2$]

Two-body (on-shell) decays

[no polarization properties of the final state accessible]

e.g. $h \rightarrow \gamma\gamma, \mu\mu, \tau\tau, bb$

E.g.: $\mathcal{A}(h \rightarrow Z ee) \sim$

$$\varepsilon_{\mu}^Z J_{\mu}^{e_L} [f_1^{Ze_L}(q^2) g^{\mu\nu} + f_3^{Ze_L}(q^2) (pq g^{\mu\nu} - q^{\mu} p^{\nu}) + \dots]$$

N.B.: There is nothing “wrong” or “dangerous” in using $f.f.$, provided

- they are defined from on-shell amplitudes
[*hill-defined for $h \rightarrow WW^*, ZZ^*$ but perfectly ok for $h \rightarrow 4\ell$*]
- no model-dependent assumptions are made on their functional form

► PO in Higgs decays

Multi-body modes

e.g. $h \rightarrow 4\ell, \ell\ell\gamma, \dots$

Form factors $\rightarrow f_i(\mathbf{s})$ [E.g.: $s = m_{\ell\ell}^2$]

Momentum expansion of the $f.f.$ around leading poles

$$\text{E.g.: } f_i^{\text{SM+NP}} = \frac{\kappa_i}{s - m_Z^2 + im_Z\Gamma_Z} + \frac{\varepsilon_i}{m_Z^2} + \mathcal{O}(s/m_Z^4)$$

Two-body (on-shell) decays

[no polarization properties of the final state accessible]

e.g. $h \rightarrow \gamma\gamma, \mu\mu, \tau\tau, bb$

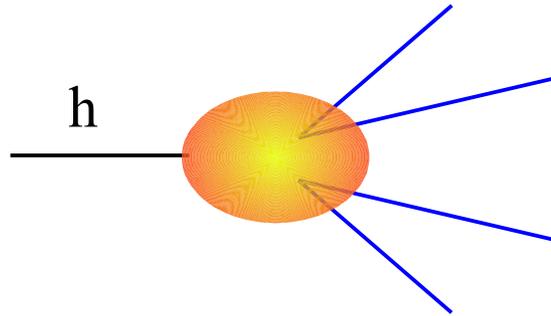

$\kappa_i (\leftrightarrow \Gamma_i)$

Gonzales-Alonso *et al.*
1412.6038

- No need to specify any detail about the EFT, but for the absence of light new particles \rightarrow momentum expansion very well justified by the Higgs kinematic
- The $\{\kappa_i, \varepsilon_i\}$ thus defined are well-defined **PO** \rightarrow systematic inclusion of higher-order QED and QCD (soft) corrections possible (and necessary...)

The $h \rightarrow 4f$ case

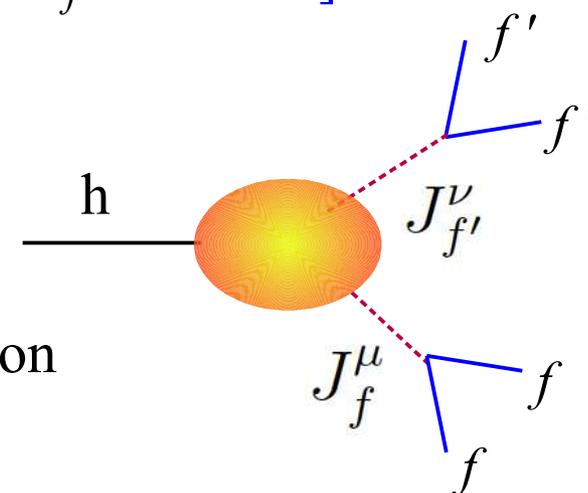

► The $h \rightarrow 4f$ case

Two main hypotheses:

- I. Fermion couples to the Higgs via helicity-conserving local currents
 [↔ neglect helicity-violating interactions, naturally linked to m_f also BSM]

$$G_{[JJh]} = \langle 0 | \mathcal{T} \{ J_f^\mu(x), J_{f'}^\nu(y), h(0) \} | 0 \rangle$$

The amplitude is fully determined by this Green function that contains **long-distance modes** (↔ **non-local terms** in x and y due to the exchange of EW gauge bosons) & **short-distance modes** (↔ **contact terms** for x or $y \rightarrow 0$)

Only 3 Lorentz structures allowed, e.g.:

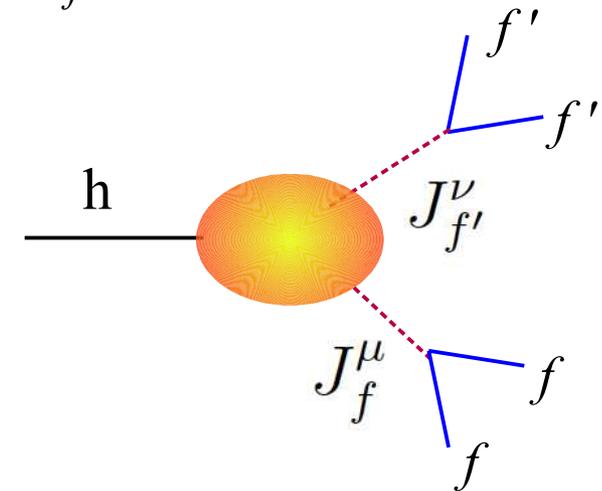

$$\mathcal{A} = i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e} \gamma_\alpha e) (\bar{\mu} \gamma_\beta \mu) \times \left[F_1^{e\mu}(q_1^2, q_2^2) g^{\alpha\beta} + F_3^{e\mu}(q_1^2, q_2^2) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + F_4^{e\mu}(q_1^2, q_2^2) \frac{\varepsilon^{\alpha\beta\rho\sigma} q_{2\rho} q_{1\sigma}}{m_Z^2} \right]$$

► The $h \rightarrow 4f$ case

Two main hypotheses:

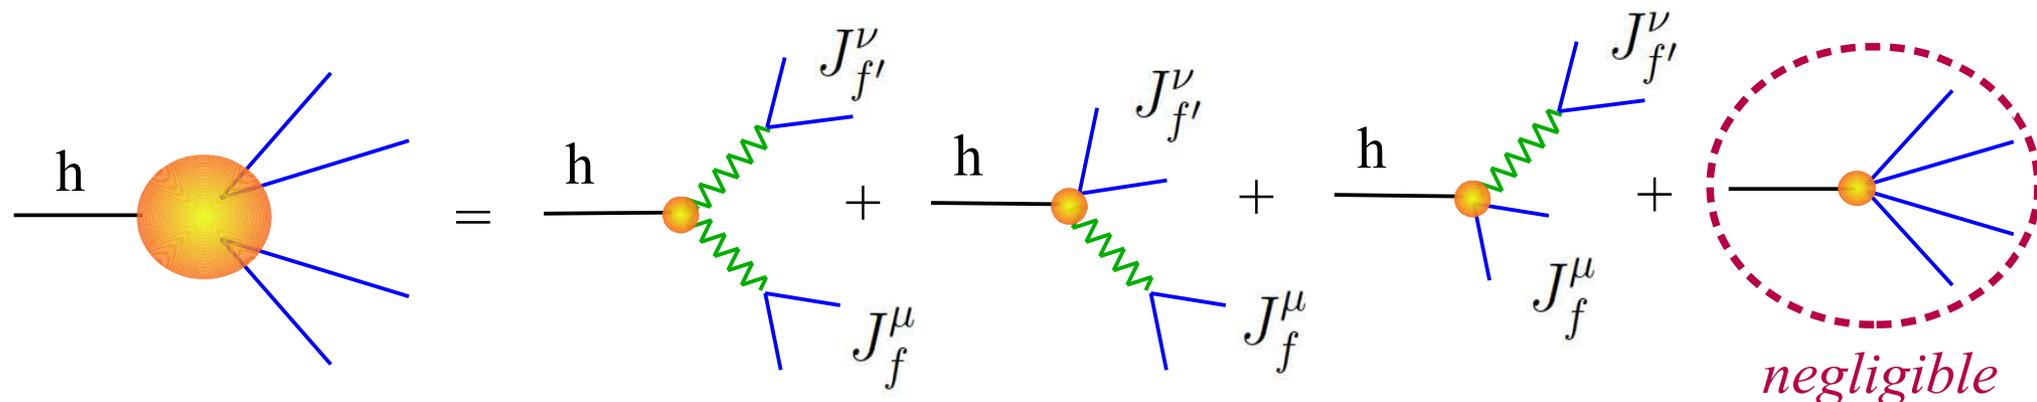

- I. Fermion couples to the Higgs via helicity-conserving local currents
 [↔ neglect helicity-violating interactions, naturally linked to m_f also BSM]

$$G_{[JJh]} = \langle 0 | \mathcal{T} \{ J_f^\mu(x), J_{f'}^\nu(y), h(0) \} | 0 \rangle$$

- II. Expansion of $G_{[JJh]}$ neglecting short-distance modes corresponding to local operators with $d > 6$

*non-local amplitude
at the EW scale:*

► The $h \rightarrow 4f$ case

Following these hypotheses we can expand the form factors around the physical poles and retain only the leading terms (in the momentum expansion), e.g.:

$$\mathcal{A} = i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e}\gamma_\alpha e)(\bar{\mu}\gamma_\beta \mu) \times$$

$$\left[\left(\kappa_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \frac{\epsilon_{Ze}}{m_Z^2} \frac{g_Z^\mu}{P_Z(q_2^2)} + \frac{\epsilon_{Z\mu}}{m_Z^2} \frac{g_Z^e}{P_Z(q_1^2)} \right) g^{\alpha\beta} + \right.$$

$$\left. + \left(\epsilon_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \kappa_{Z\gamma}^{\text{SM-1L}} \left(\frac{eQ_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{eQ_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \kappa_{\gamma\gamma}^{\text{SM-1L}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + \right.$$

$$\left. + \left(\epsilon_{ZZ}^{\text{CP}} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \epsilon_{Z\gamma}^{\text{CP}} \left(\frac{eQ_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{eQ_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \epsilon_{\gamma\gamma}^{\text{CP}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{\epsilon^{\alpha\beta\rho\sigma} q_{2\rho} q_{1\sigma}}{m_Z^2} \right]$$

$$P_Z(q^2) = q^2 - m_Z^2 + im_Z \Gamma_Z$$

$$\epsilon_{\gamma\gamma}^{\text{SM-1L}} \simeq 3.8 \times 10^{-3}$$

$$\epsilon_{Z\gamma}^{\text{SM-1L}} \simeq 6.7 \times 10^{-3}$$

- The $\{\kappa_i, \epsilon_i\}$ are defined from the residues of the amplitude on the physical poles \rightarrow well-defined **PO** that can be extracted from data and computed to desired accuracy in a given BSM framework
- By construction, the g_Z^f are the PO from Z-pole measurements, while $\kappa_{\gamma\gamma}$ and $\kappa_{Z\gamma}$ are the standard “kappas” from on-shell $h \rightarrow \gamma\gamma$ and $h \rightarrow Z\gamma$

► The $h \rightarrow 4f$ case

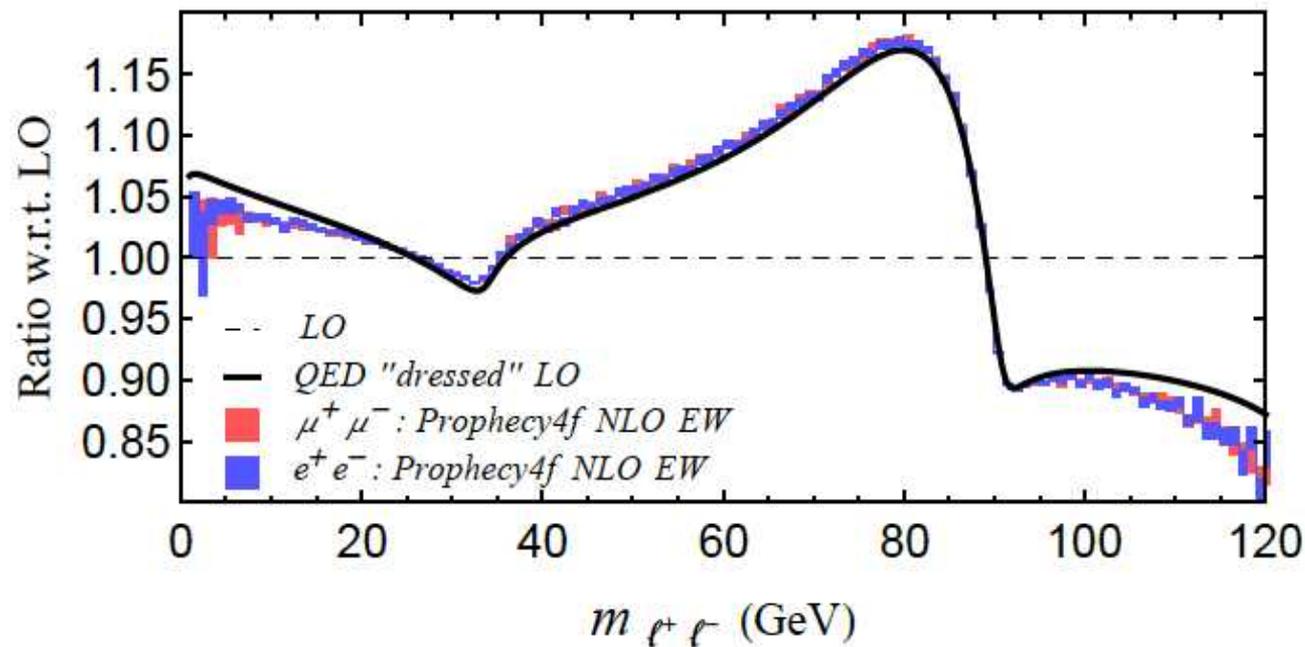

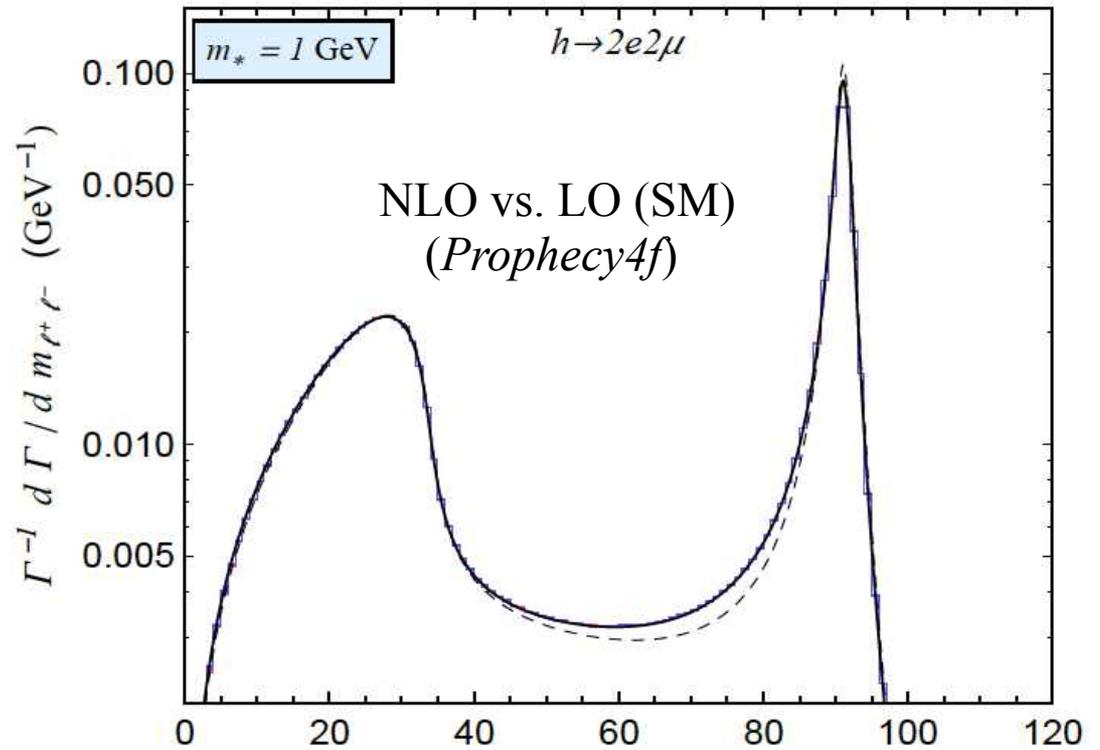

Following these hypotheses we can expand the form factors around the physical poles and retain only the leading terms (in the momentum expansion), e.g.:

$$\begin{aligned}
 \mathcal{A} = & i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e}\gamma_\alpha e)(\bar{\mu}\gamma_\beta \mu) \times & \epsilon_{\gamma\gamma}^{\text{SM-1L}} \simeq 3.8 \times 10^{-3} \\
 & \left[\left(\kappa_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \frac{\epsilon_{Ze}}{m_Z^2} \frac{g_Z^\mu}{P_Z(q_2^2)} + \frac{\epsilon_{Z\mu}}{m_Z^2} \frac{g_Z^e}{P_Z(q_1^2)} \right) g^{\alpha\beta} + & \epsilon_{Z\gamma}^{\text{SM-1L}} \simeq 6.7 \times 10^{-3} \\
 & + \left(\epsilon_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \kappa_{Z\gamma} \epsilon_{Z\gamma}^{\text{SM-1L}} \left(\frac{eQ_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{eQ_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \kappa_{\gamma\gamma} \epsilon_{\gamma\gamma}^{\text{SM-1L}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + \\
 & + \left(\epsilon_{ZZ}^{\text{CP}} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \epsilon_{Z\gamma}^{\text{CP}} \left(\frac{eQ_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{eQ_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \epsilon_{\gamma\gamma}^{\text{CP}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{\epsilon^{\alpha\beta\rho\sigma} q_{2\rho} q_{1\sigma}}{m_Z^2} \Big] + \Delta_{\text{non-loc}}(q_1, q_2)
 \end{aligned}$$

- The κ_i are normalized such that the SM is recovered in the limit $\kappa_i \rightarrow 1$
- The ϵ_i describe terms not present in the SM at the tree level (*and always sub-leading*): SM recovered for $\epsilon_i^{\text{(SM)}} = \mathcal{O}(10^{-3}) \rightarrow 0$
- To this amplitude we can apply a “radiation function” to take into account QED radiation \rightarrow excellent description of SM (and NP) beyond the tree level.

► The $h \rightarrow 4f$ case

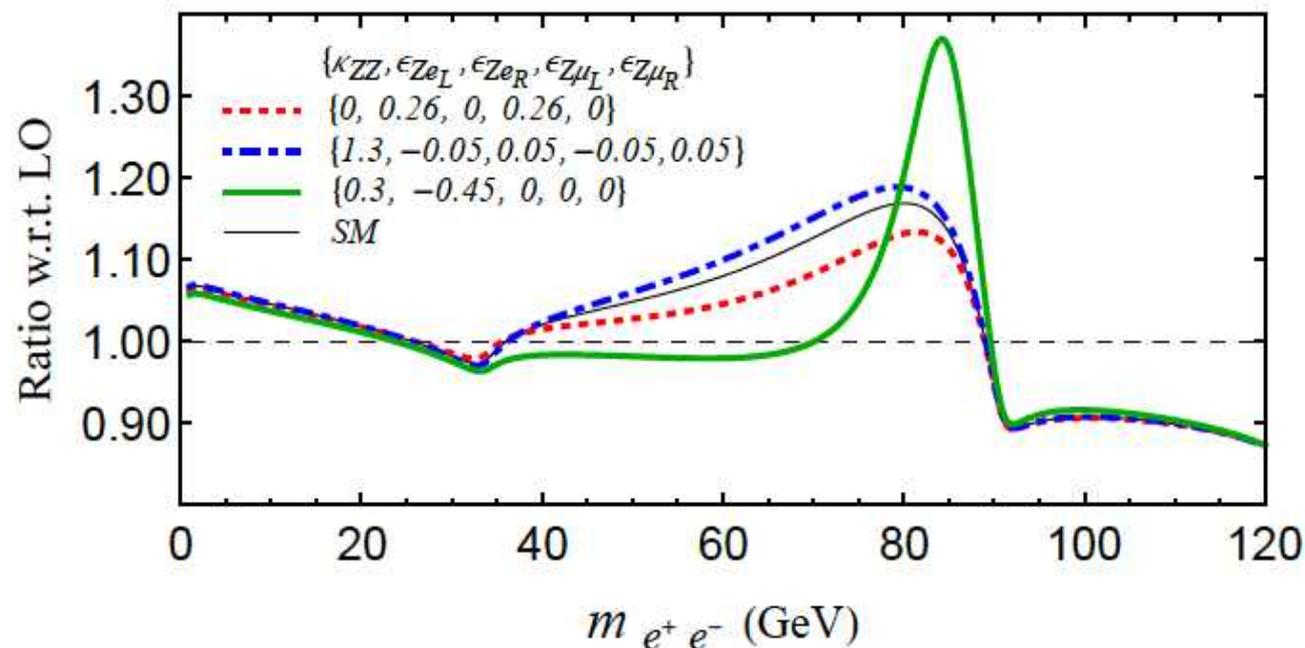

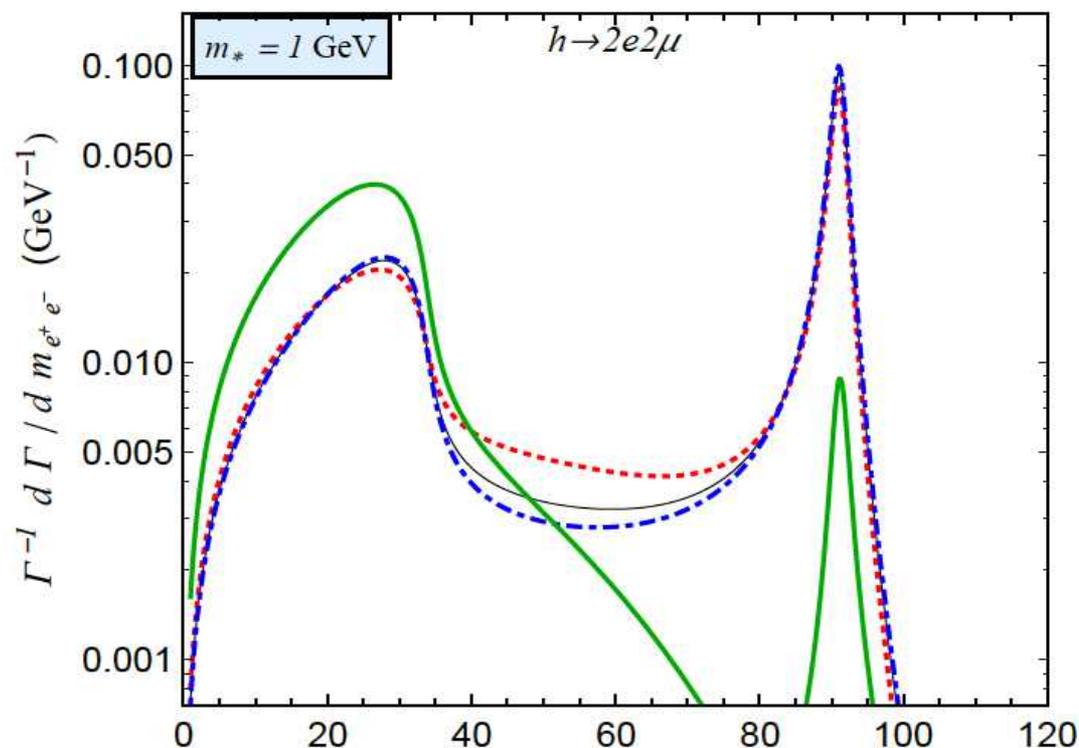

“Dressing” with QED radiation → **excellent description of SM beyond the tree level**

Bordone, Greljo, G.I., Marzocca, Patteri, arXiv: 1507.02555

► The $h \rightarrow 4f$ case

“Dressing” with QED radiation \rightarrow excellent description of SM beyond the tree level & relevant impact for BSM @ NLO

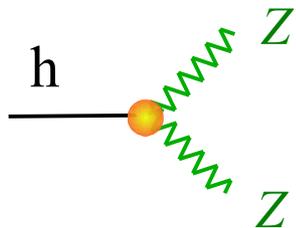

Bordone, Greljo, G.I., Marzocca, Patteri, arXiv: 1507.02555

► The $h \rightarrow 4f$ case

The “physical meaning” of the parameters appearing in this decomposition is not obvious at first sight, but it is actually quite simple:

$$\begin{aligned}
 \mathcal{A} = & i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e} \gamma_\alpha e) (\bar{\mu} \gamma_\beta \mu) \times \\
 & \left[\left(\kappa_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \frac{\epsilon_{Ze}}{m_Z^2} \frac{g_Z^\mu}{P_Z(q_2^2)} + \frac{\epsilon_{Z\mu}}{m_Z^2} \frac{g_Z^e}{P_Z(q_1^2)} \right) g^{\alpha\beta} + \right. \\
 & \left. + \left(\epsilon_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \kappa_{Z\gamma}^{\text{SM-1L}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \kappa_{\gamma\gamma}^{\text{SM-1L}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + \right. \\
 & \left. + \left(\epsilon_{ZZ}^{\text{CP}} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \epsilon_{Z\gamma}^{\text{CP}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \epsilon_{\gamma\gamma}^{\text{CP}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{\epsilon^{\alpha\beta\rho\sigma} q_{2\rho} q_{1\sigma}}{m_Z^2} \right]
 \end{aligned}$$

“double Z-pole”

$$\Gamma(h \rightarrow Z_L Z_L) \equiv \frac{\Gamma(h \rightarrow 2e2\mu) [\kappa_{ZZ}]}{\mathcal{B}(Z \rightarrow 2e) \mathcal{B}(Z \rightarrow 2\mu)} = 0.209 |\kappa_{ZZ}|^2 \text{ MeV}$$

$$\Gamma(h \rightarrow Z_T Z_T) \equiv \frac{\Gamma(h \rightarrow 2e2\mu) [\epsilon_{ZZ}]}{\mathcal{B}(Z \rightarrow 2e) \mathcal{B}(Z \rightarrow 2\mu)} = 0.0189 |\epsilon_{ZZ}|^2 \text{ MeV}$$

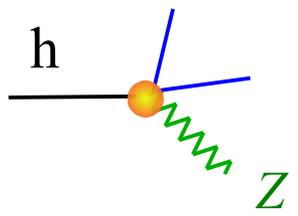

$$\Gamma^{\text{CPV}}(h \rightarrow Z_T Z_T) \equiv \frac{\Gamma(h \rightarrow 2e2\mu) [\epsilon_{ZZ}^{\text{CP}}]}{\mathcal{B}(Z \rightarrow 2e) \mathcal{B}(Z \rightarrow 2\mu)} = 0.00799 |\epsilon_{ZZ}^{\text{CP}}|^2 \text{ MeV}$$

► The $h \rightarrow 4f$ case

The “physical meaning” of the parameters appearing in this decomposition is not obvious at first sight, but it is actually quite simple:

$$\begin{aligned}
 \mathcal{A} = & i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e} \gamma_\alpha e) (\bar{\mu} \gamma_\beta \mu) \times \\
 & \left[\left(\kappa_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \frac{\epsilon_{Ze}}{m_Z^2} \frac{g_Z^\mu}{P_Z(q_2^2)} + \frac{\epsilon_{Z\mu}}{m_Z^2} \frac{g_Z^e}{P_Z(q_1^2)} \right) g^{\alpha\beta} + \right. \\
 & + \left(\epsilon_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \kappa_{Z\gamma}^{\text{SM-1L}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \kappa_{\gamma\gamma}^{\text{SM-1L}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + \\
 & \left. + \left(\epsilon_{ZZ}^{\text{CP}} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \epsilon_{Z\gamma}^{\text{CP}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \epsilon_{\gamma\gamma}^{\text{CP}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{\epsilon^{\alpha\beta\rho\sigma} q_{2\rho} q_{1\sigma}}{m_Z^2} \right]
 \end{aligned}$$

“single Z-pole”

$$\Gamma(h \rightarrow Z l^+ l^-) = 0.0366 |\epsilon_{Zl}|^2 \text{ MeV}$$

► The $h \rightarrow 4f$ case

The PO are **calculable** in the (various) **Higgs-EFT approaches** (both linear and non-linear EFT)

$$\begin{aligned}
 \mathcal{A} = & i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e} \gamma_\alpha e) (\bar{\mu} \gamma_\beta \mu) \times \\
 & \left[\left(\kappa_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \frac{\epsilon_{Ze}}{m_Z^2} \frac{g_Z^\mu}{P_Z(q_2^2)} + \frac{\epsilon_{Z\mu}}{m_Z^2} \frac{g_Z^e}{P_Z(q_1^2)} \right) g^{\alpha\beta} + \right. \\
 & + \left(\epsilon_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \kappa_{Z\gamma} \epsilon_{Z\gamma}^{\text{SM-1L}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \kappa_{\gamma\gamma} \epsilon_{\gamma\gamma}^{\text{SM-1L}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + \\
 & \left. + \left(\epsilon_{ZZ}^{\text{CP}} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \epsilon_{Z\gamma}^{\text{CP}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \epsilon_{\gamma\gamma}^{\text{CP}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{\epsilon^{\alpha\beta\rho\sigma} q_{2\rho} q_{1\sigma}}{m_Z^2} \right]
 \end{aligned}$$

In the limit where we work at the tree-level in the EFT there is a simple linear relation between PO and EFT couplings: each PO represent a unique linear combination of couplings of the most general Higgs EFT (*non-linear EW symm. breaking, no custodial symm., no flavor symm., no CP symmetry*).

► The $h \rightarrow 4f$ case

The PO are **calculable** in the (various) **Higgs-EFT approaches** (both linear and non-linear EFT)

$$\begin{aligned}
 \mathcal{A} = & i \frac{2m_Z^2}{v_F} \sum_{e=e_L, e_R} \sum_{\mu=\mu_L, \mu_R} (\bar{e} \gamma_\alpha e) (\bar{\mu} \gamma_\beta \mu) \times \\
 & \left[\left(\kappa_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \frac{\epsilon_{Ze}}{m_Z^2} \frac{g_Z^\mu}{P_Z(q_2^2)} + \frac{\epsilon_{Z\mu}}{m_Z^2} \frac{g_Z^e}{P_Z(q_1^2)} \right) g^{\alpha\beta} + \right. \\
 & + \left(\epsilon_{ZZ} \frac{g_Z^e g_Z^\mu}{P_Z(q_1^2) P_Z(q_2^2)} + \kappa_{Z\gamma} \epsilon_{Z\gamma}^{\text{SM-1L}} \left(\frac{e Q_\mu g_Z^e}{q_2^2 P_Z(q_1^2)} + \frac{e Q_e g_Z^\mu}{q_1^2 P_Z(q_2^2)} \right) + \kappa_{\gamma\gamma} \epsilon_{\gamma\gamma}^{\text{SM-1L}} \frac{e^2 Q_e Q_\mu}{q_1^2 q_2^2} \right) \frac{q_1 \cdot q_2 g^{\alpha\beta} - q_2^\alpha q_1^\beta}{m_Z^2} + \\

 \end{aligned}$$

In the limit where we work at the tree-level in the EFT there is a simple linear relation between PO and EFT couplings: each PO represent a unique linear combination of couplings of the most general Higgs EFT (*non-linear EW symm. breaking, no custodial symm., no flavor symm., no CP symmetry*).

N.B.: this does not hold beyond the tree-level.

The PO do not change, but their relation to EFT couplings is more involved...

Parameter counting, symmetry limits, dynamical constraints

► Parameter counting, symmetry limits, dynamical constraints

Number of independent PO for $h \rightarrow 4\ell$ ($\ell=e,\mu,\nu$) + $\ell\ell\gamma$ + $\gamma\gamma$:

| Decay modes | <i>flavor + CP symm.</i> | <i>flavor non univ.</i> | <i>CP violation</i> |
|--|---|---|---|
| $h \rightarrow \gamma\gamma, 2e\gamma, 2\mu\gamma$ $4e, 4\mu, 2e2\mu$ | $\kappa_{ZZ}, \kappa_{Z\gamma}, \kappa_{\gamma\gamma}$ (6) $\epsilon_{ZZ}, \epsilon_{Ze_L}, \epsilon_{Ze_R}$ | $\epsilon_{Z\mu_L}, \epsilon_{Z\mu_R}$ (2) | $\epsilon_{ZZ}^{CP}, \epsilon_{Z\gamma}^{CP}, \epsilon_{\gamma\gamma}^{CP}$ (3) |
| $h \rightarrow 2e2\nu, 2\mu2\nu, e\nu\mu\nu$ | κ_{WW} (4) $\epsilon_{WW}, \epsilon_{Z\nu_e}, \text{Re}(\epsilon_{We_L})$ | $\epsilon_{Z\nu_\mu}, \text{Re}(\epsilon_{W\mu_L})$ $\text{Im}(\epsilon_{W\mu_L})$ (5) | $\epsilon_{WW}^{CP}, \text{Im}(\epsilon_{We_L})$ |
| all modes <i>with custodial symmetry</i> | $\kappa_{ZZ}, \kappa_{Z\gamma}, \kappa_{\gamma\gamma}$ $\epsilon_{ZZ}, \epsilon_{Ze_L}, \epsilon_{Ze_R}$ $\text{Re}(\epsilon_{We_L})$ (7) | $\epsilon_{Z\mu_L}, \epsilon_{Z\mu_R}$ | $\epsilon_{ZZ}^{CP}, \epsilon_{Z\gamma}^{CP}, \epsilon_{\gamma\gamma}^{CP}$ |

20 (no symmetries) \rightarrow 7 (CP + Lepton Univ + Custodial)

The symmetry assumptions can be directly tested from data, focusing on specific kinematical distributions sensitive to the relevant PO's [e.g. **CPV-violating observables** & **LFU tests** → key role played by the “contact terms” (ϵ_{Zl})]

► Parameter counting, symmetry limits, dynamical constraints

Computing the PO in specific EFT (e.g.: *the linear EFT*) we get additional dynamical constraints dictated by the specific extra dynamical assumption of the EFT employed (e.g.: *h belongs to the $SU(2)_L$ doublet breaking the EW symmetry*)

The most powerful of such constraints is the link between the contact terms and EW precision measurements performed at LEP:

EPWO + Linear EFT \longrightarrow small (tiny) & flavor-universal ϵ_{Zl}

Contino *et al.*, 1303.3876
Pomarol & Riva, 1308.2803

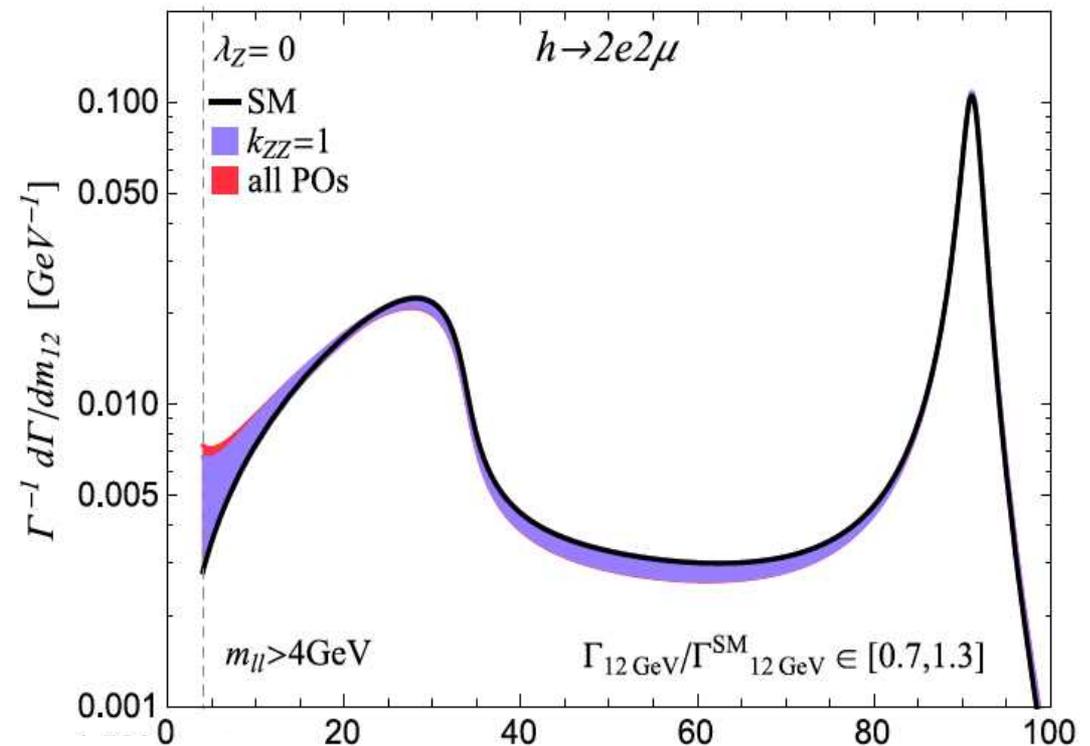

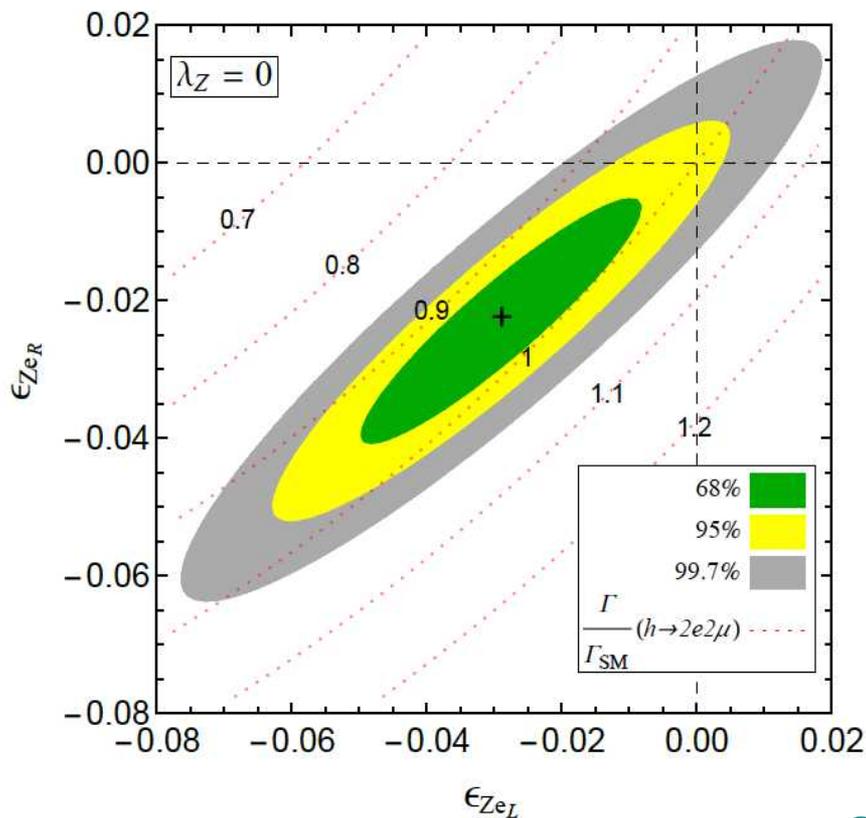

Excellent opportunity to test from data (via $h \rightarrow 4l$)
if h belongs to a pure $SU(2)_L$ doublet

The most powerful of such constraints is the link between the contact terms and EW precision measurements performed at LEP.

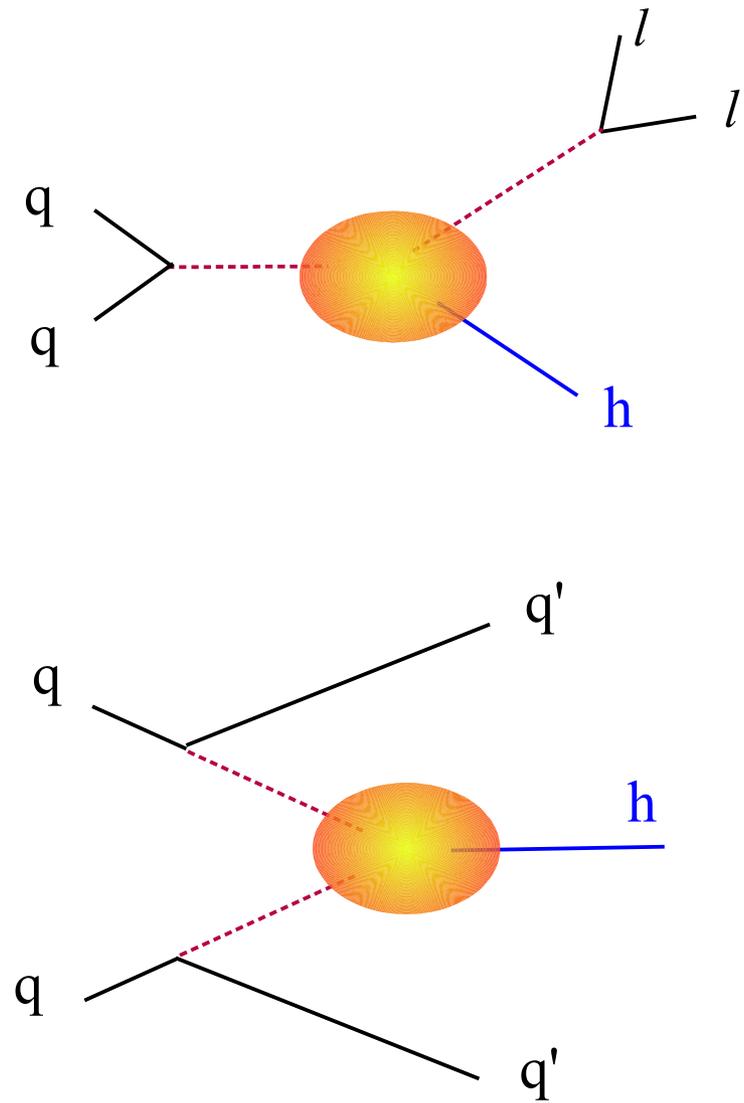

Main message: full complementary between PO approach and EFT.

- PO → inputs for EFT coupling fits
- EFT → predictions of relations between different PO sets (that can be tested)

PO beyond decays

vs.

► PO beyond decays

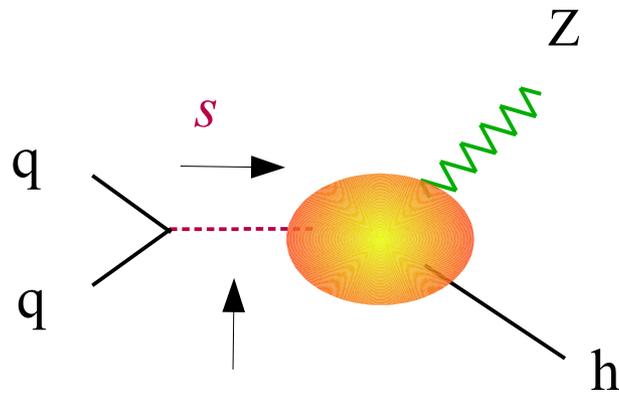

The same Green Function controlling $h \rightarrow 4f$ decays is accessible also in $pp \rightarrow hV$ and $pp \rightarrow h$ via VBF, i.e. the two leading EW-type Higgs production processes (*N.B.: this follows from “plain QFT” no need to invoke any EFT...*)

$$G_{[JJh]} = \langle 0 | \mathcal{T} \{ J_f^\mu(x), J_{f'}^\nu(y), h(0) \} | 0 \rangle$$

But for two important differences:

- different flavor composition ($q \leftrightarrow \ell$) \rightarrow 6 more parameters for $hZ+hW+VBF$ (with flavor & CP symm.) \rightarrow only a subset easily accessible
- different kinematical regime: momentum exp. not always justified (*large momentum transfer*)

► PO beyond decays

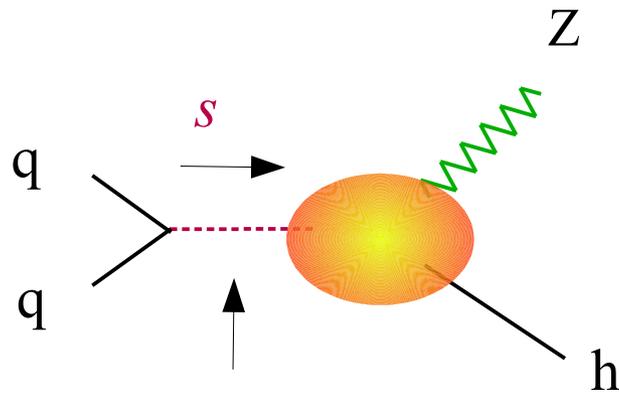

The new parameters (contact terms) to be introduced are related to the momentum transfer associated to the quark-current \leftrightarrow kinematical variable related to the possible break-down of the momentum expansion.

$$\frac{1}{s - m_Z^2} \left[g_q^Z \kappa_{ZZ} + \epsilon_{Zq} (s - m_Z^2)/m_Z^2 + \dots \right] \quad s = (m_{hZ})^2$$

In VBF the “dangerous” kinematical variables are the p_T of the two outgoing (VBF-tag) jets

► PO beyond decays

The new parameters (contact terms) to be introduced are related to the momentum transfer associated to the quark-current \leftrightarrow kinematical variable related to the possible break-down of the momentum expansion.

$$\frac{1}{s - m_Z^2} \left[g_{qZ}^Z \kappa_{ZZ} + \frac{\epsilon_{Zq} (s - m_Z^2)/m_Z^2 + \dots}{\epsilon_{Zq}(s)} \right] \quad s = (m_{hZ})^2$$

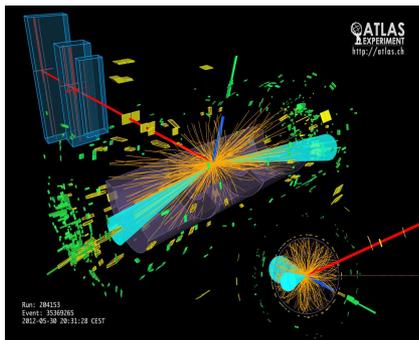

Most general procedure to deal with this problem:

- Measure the contact terms (ϵ_{Zq} , ϵ_{Wq}) as a function of the “dangerous” kinematical variable defining different kinematical bins \rightarrow a-posteriori data-driven (unbiased) check of the validity of the momentum expansion
- Note that, by construction (because of unitarity), the pole terms (κ 's) are momentum independent

Conclusions

The 125 GeV scalar is certainly compatible with the properties of the SM Higgs boson, but we are still far from having explored its properties in great detail.

The **PO** represent a general tool for the exploration of such properties (in view of high-statistics data), with minimum loss of information and minimum theoretical bias.

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi + \text{h.c.} \\ & + \chi_i y_{ij} \chi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$
