# The problem

- ❑ CMS has found that in the Geant4 simulations of its calorimeter test-beam set-up, the energy response as a function of beam energy presents some **unphysical discontinuities**
- ❑ ATLAS has then found the same behavior in their calorimeter test-beam set-ups, and also for other observables, like energy resolution vs. beam energy
- ❑ This is a worrisome feature, because **jets** at LHC are made up of hadrons of quite different energies, so it can potentially affect several analyses, and any simulation-based jet-calibration scheme...
- ❑ The reason for these unphysical discontinuities is quite obvious: the **transition between hadronic models**. However, it is not trivial to fix it...

# Energy response vs. beam energy

Problem of matching models:

ATLAS Tile

QGSP\_BERT:  
0-9.9 GeV Bertini intra-nuclear cascade (BERT)  
9.5-25 GeV low energy parameterised model (LEP)  
>12 GeV QGSP

FTF\_BIC:  
0-5 GeV binary cascade model (BIC)  
0-5 GeV LEP for capture and fission processes  
>5 GeV Fritiof model (FTF)

# QGSP\_BERT Physics List

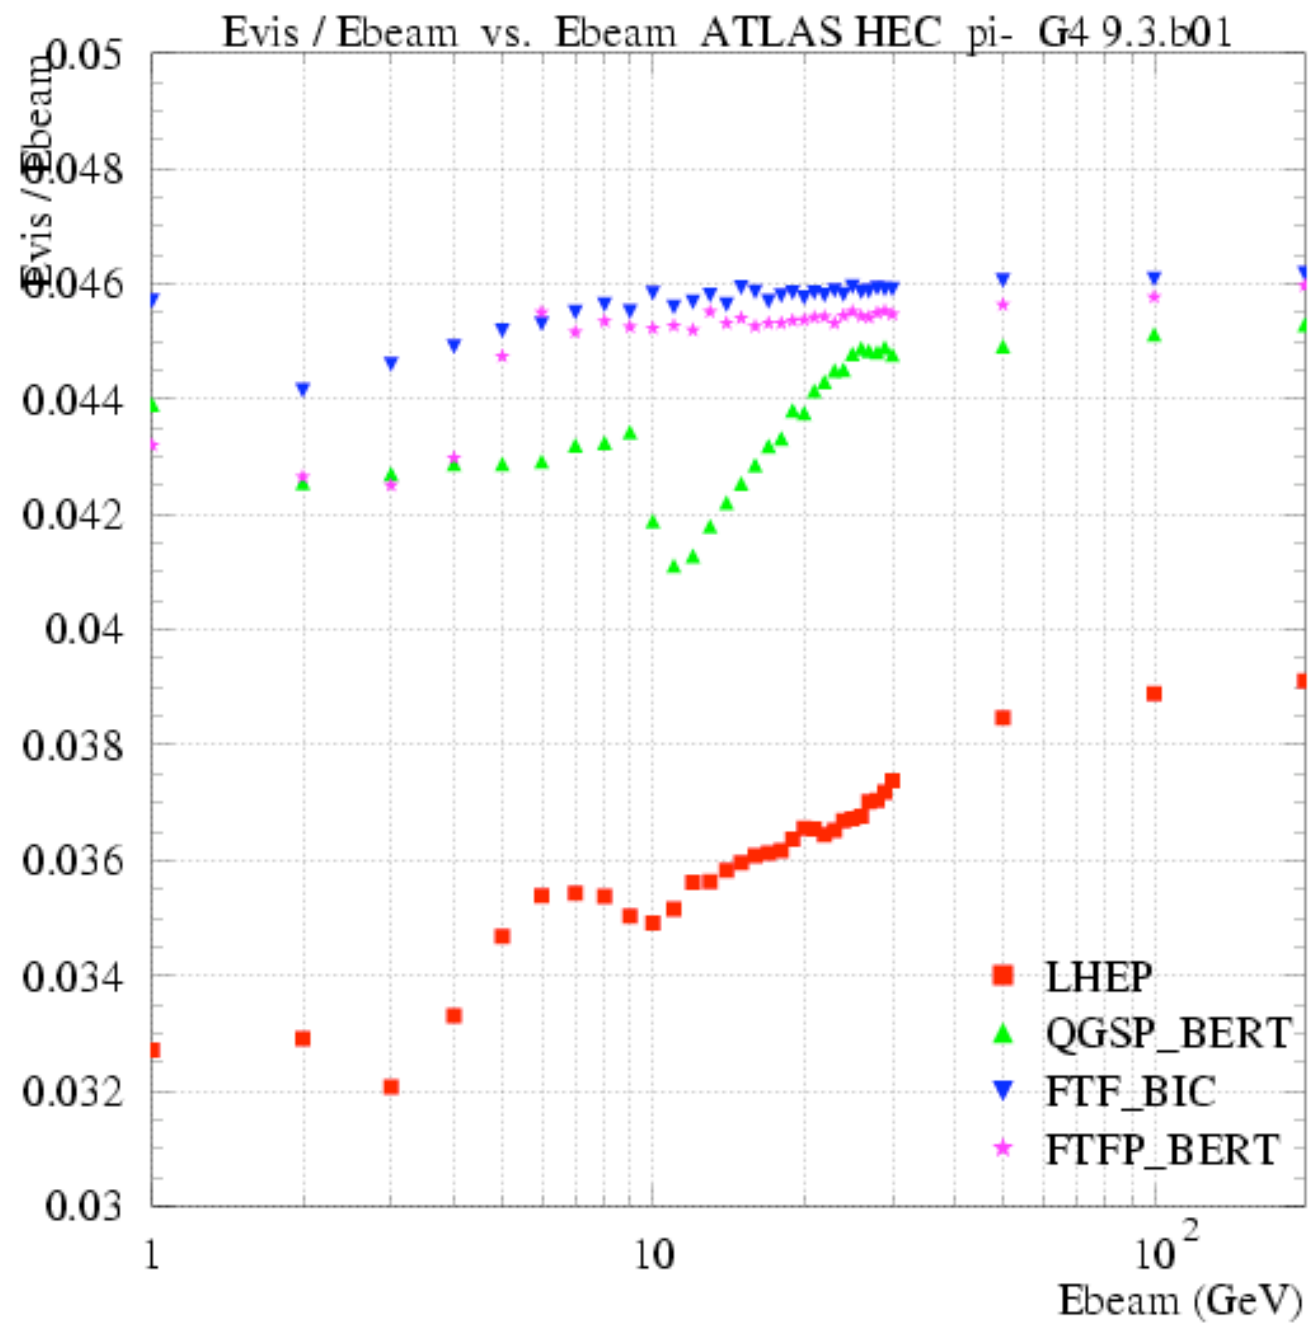

General problem of transition between:

- High-energy : string models
- Intermediate/low energy : cascade models

# Road-map

- ❑ Reproduce the problem with **simplified calorimeter**
- ❑ Compare different Physics Lists
- ❑ Understand the differences between models at **microscopic level** (i.e. thin-target, model-level)
- ❑ Improve the mixing between hadronic models in Physics Lists by:
  1. Changing the **transition regions between** models in existing Physics Lists
  2. Creating **novel mixtures of models** in new Physics Lists
  3. Improving the **hadronic models** themselves

Energy response  
in a simplified  
**Cu-LAr**  
calorimeter

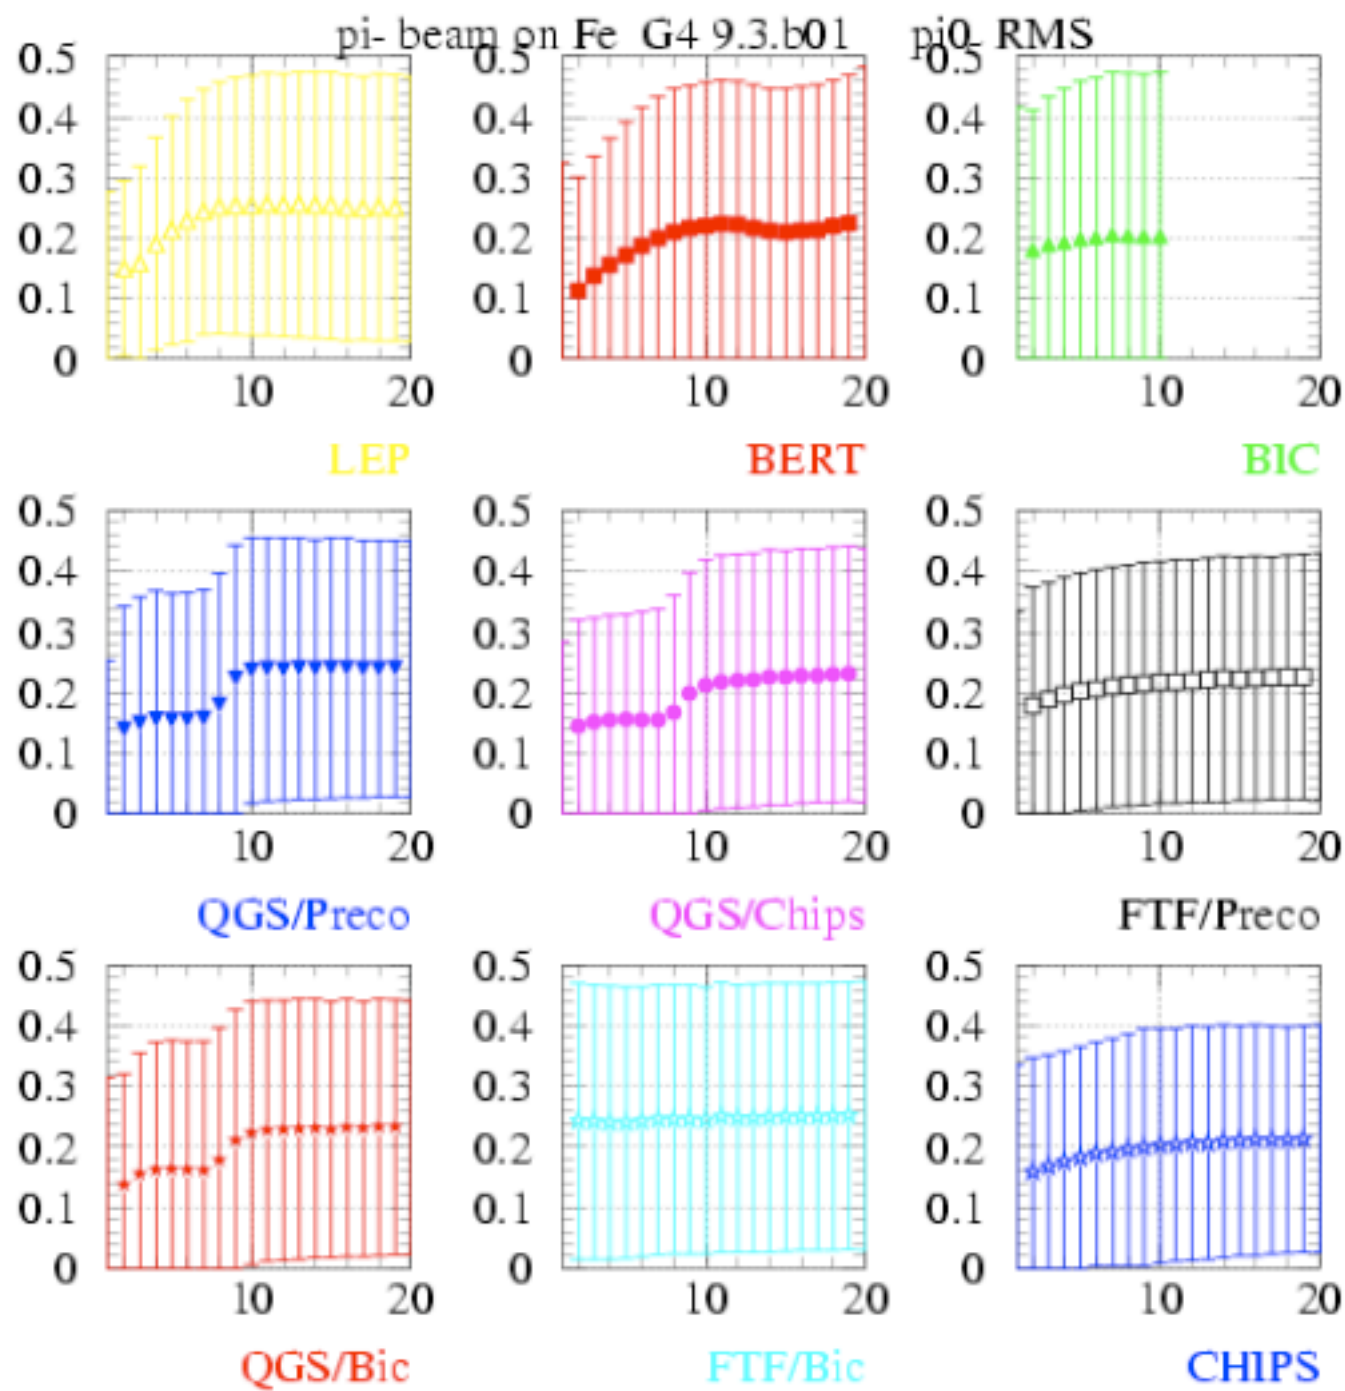

# Model-level results

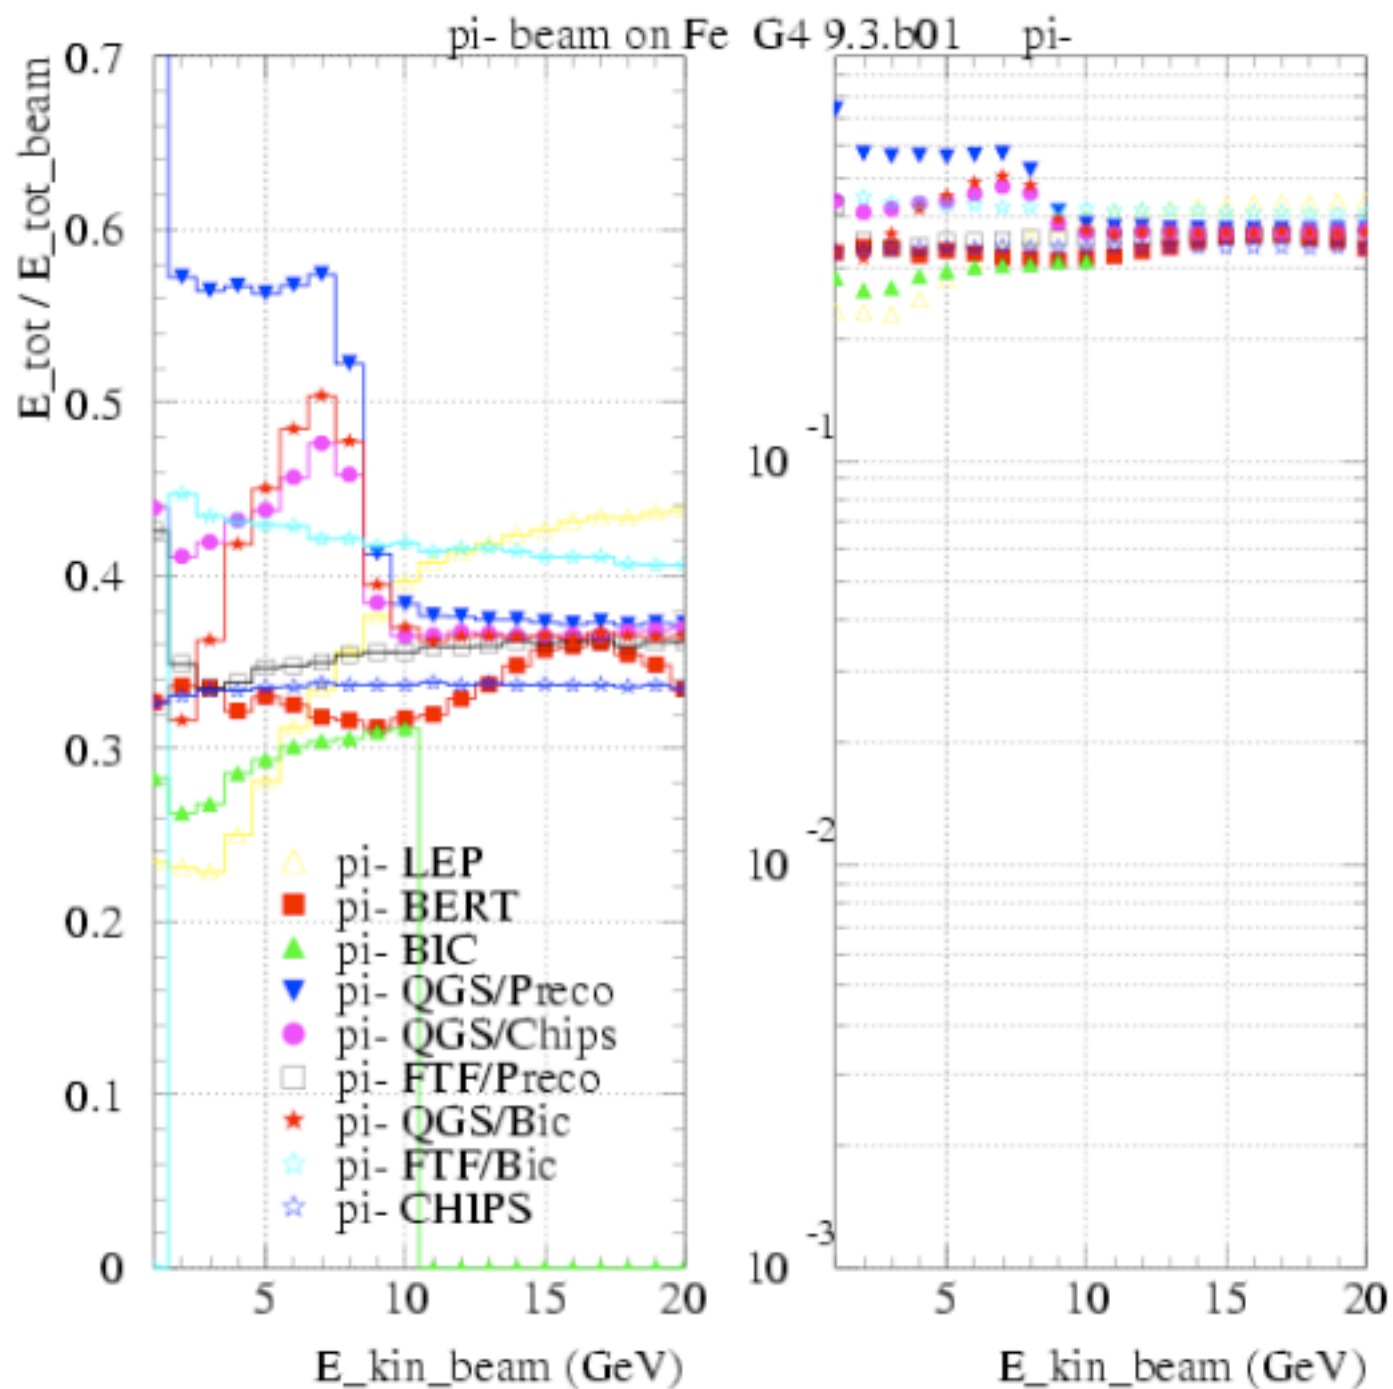

- ❑ Geant4 9.3.b01
- ❑ Beam particle:  $\pi^-$  (p, n, k, pbar)  
beam kinetic energies: 1 - 20 GeV  
target material: Iron (Pb)
- ❑ Model-level only (not Physics Lists)
- ❑ 50,000 events (i.e. interactions) simulated for each considered case
- ❑ Main variables considered:
  - ❑ Average sum of total energies of  $\pi^-$  ,  $\pi^+$  ,  $\pi^0$
  - ❑ Average sum of kinetic energies of p , n , light ions (d,t,He)
  - ❑ Average total energy
  - ❑ Ratios: n/p (backward-going),  $2 \cdot \pi^0 / (\pi^+ + \pi^-)$
  - ❑ RMS of the above variables

Too much energy  
into protons  
for Cascade  
models  
(BERT, BIC)  
for  $E_{\text{kin}} \geq 5\text{GeV}$

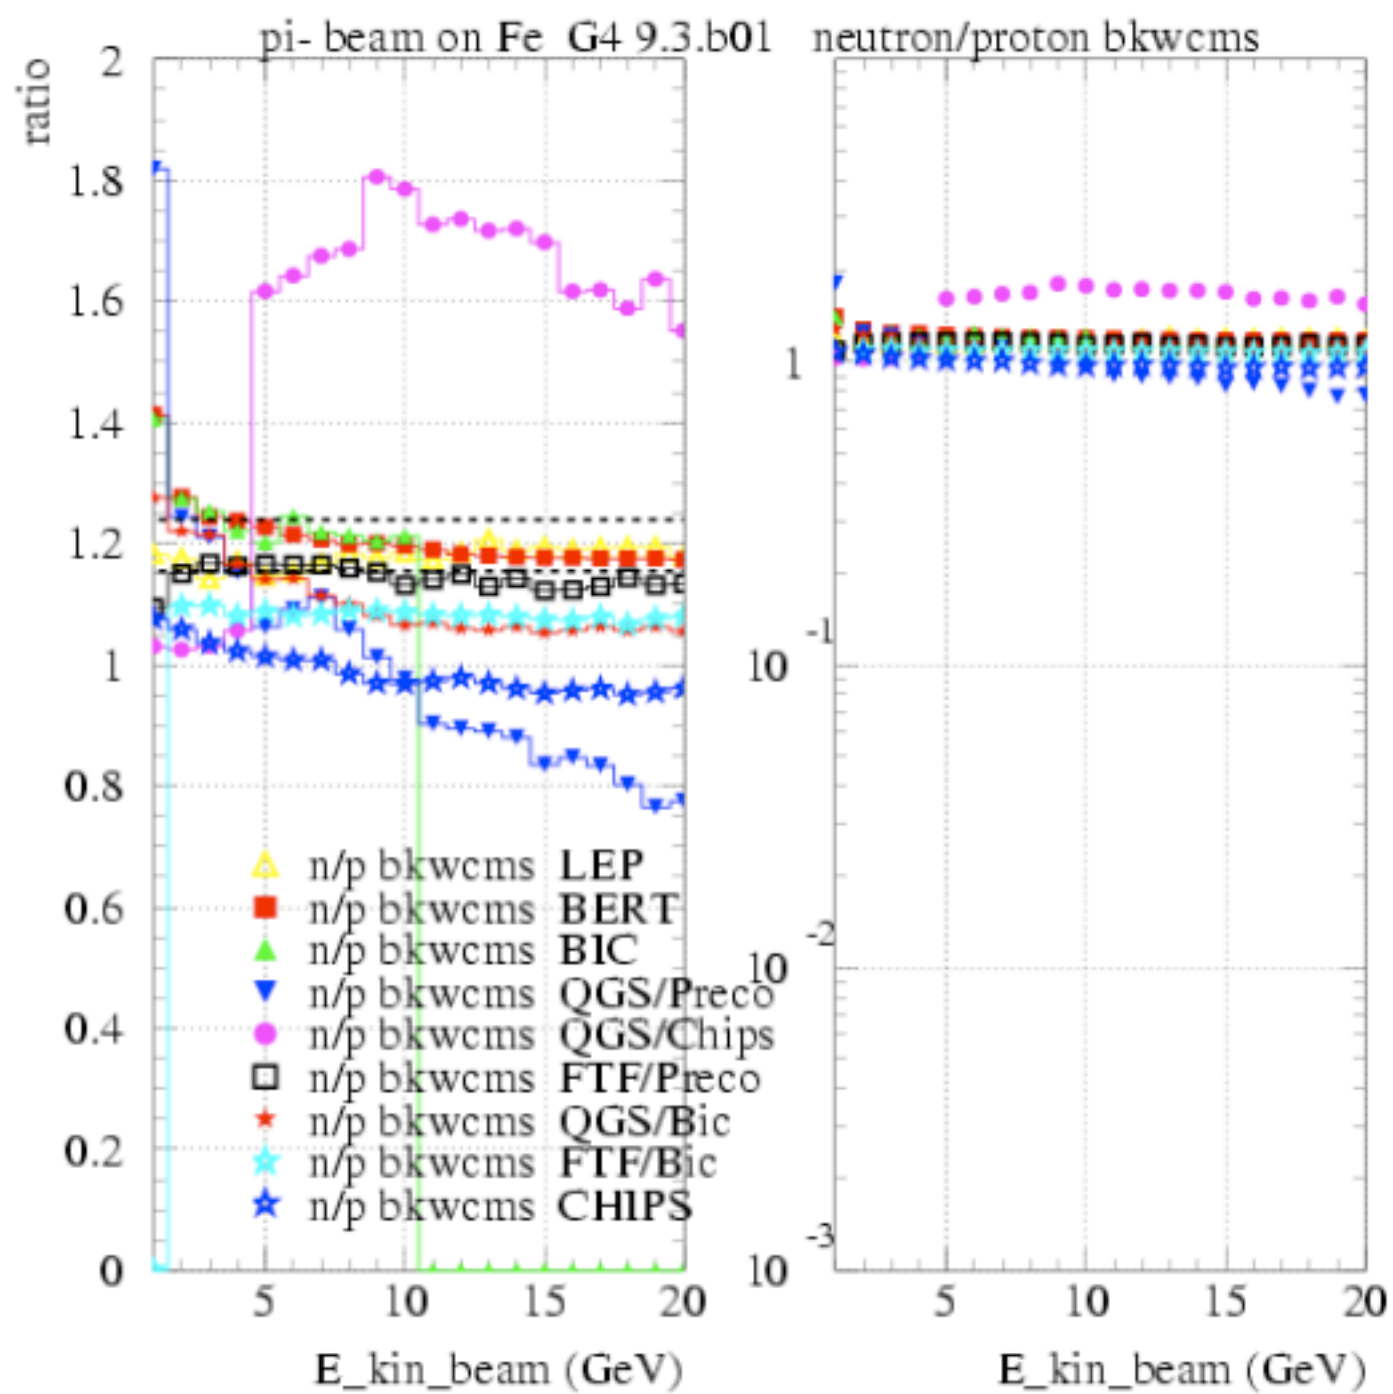

Too much energy  
into neutrons  
for Cascade  
models  
(BERT, BIC)  
at all beam  
energies

# Lessons

The discontinuity in the energy response of QGSP\_BERT Physics List in the transition region between LEP and BERT models (9.5-9.9 GeV) is mainly due to the overestimated missing energy of LEP.

- ❑ LEP model is quite different from all other models and should be use as less as possible
- ❑ Bertini and Binary cascade models appear to produce too much energy in protons (and neutrons) above around 5 GeV
- ❑ Fritiof seems to produce too many  $\pi^0$  's below 6 GeV
- ❑ Quark-Gluon-String model could be extended down to around 9 GeV
- ❑ Energy non-conservation to be fixed in FTF/Bic
- ❑ RMS are similar for almost all models
- ❑ Suggestion on a likely better choice of the transition regions, and/or model mixing (see next slide)

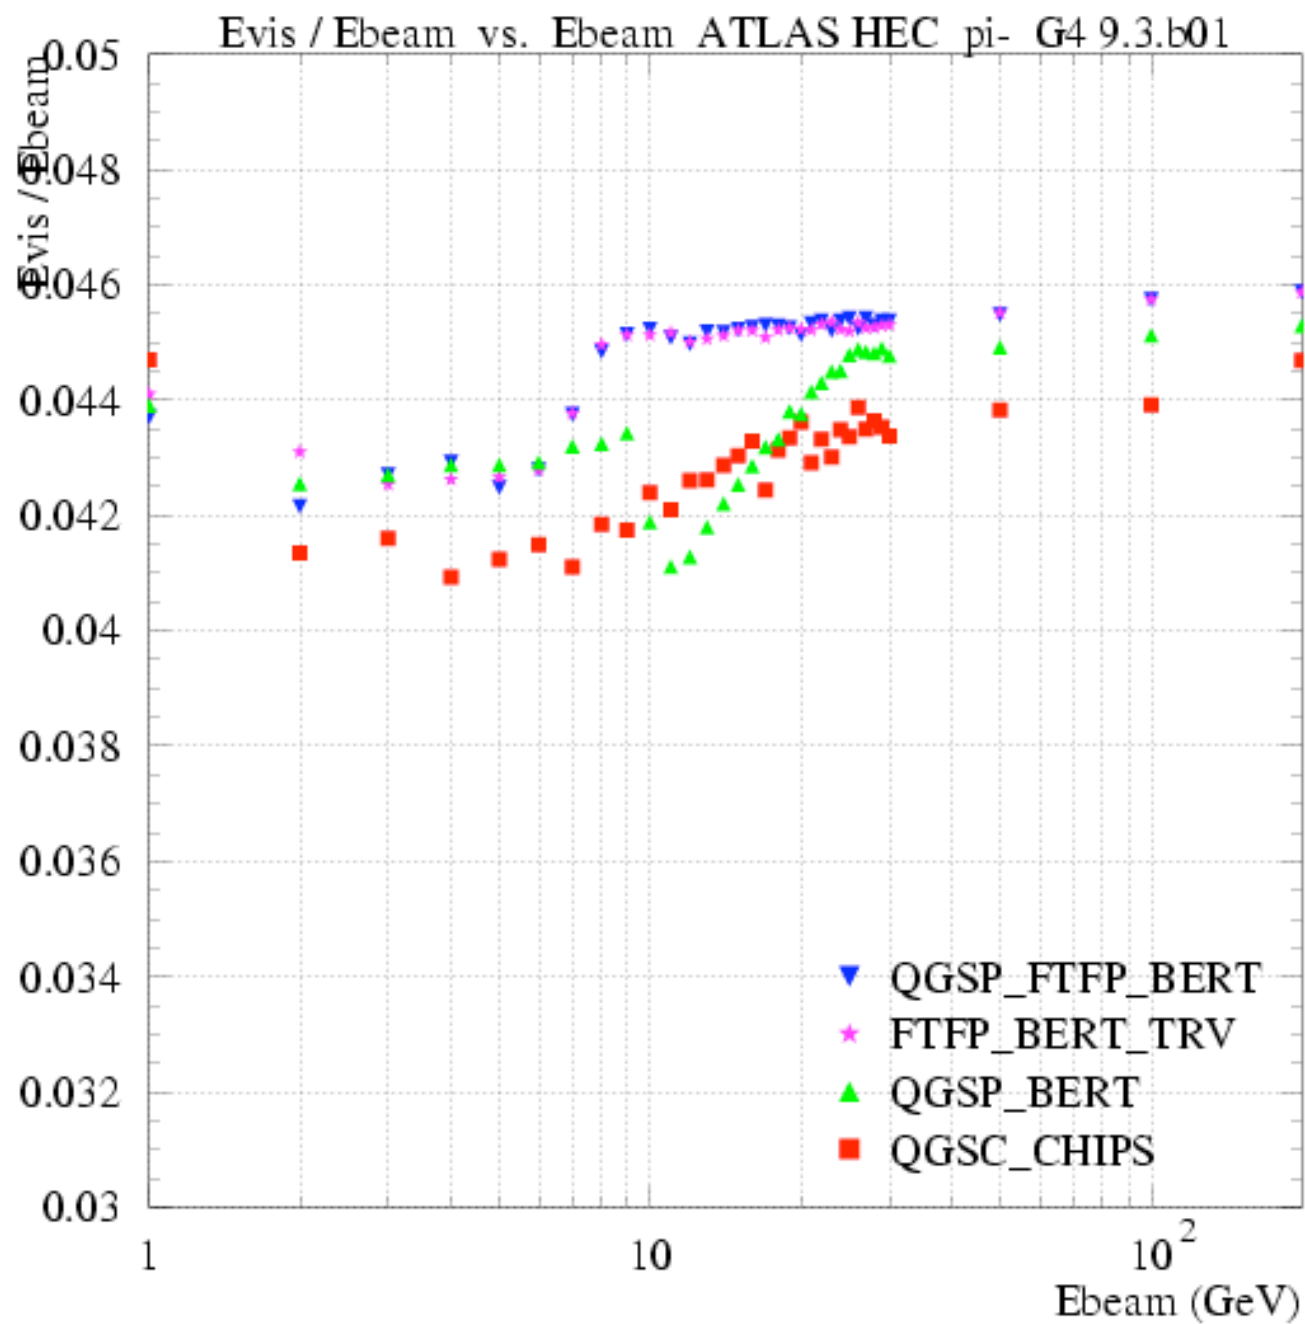

## New transition regions and/or combination of models

- **FTFP\_BERT\_TRV** : transition between Fritiof (FTF) and Bertini cascade (BERT) moved in the region **6 - 8 GeV** (originally it was 4 - 5 GeV)
- **QGSP\_FTFP\_BERT** : parameterized model (LEP) replaced with Fritiof/Preco model in a QGSP\_BERT-like Physics List. The transition region between FTFP and BERT is **6 - 8 GeV** (instead of 9.5-9.9 GeV)

Experimental Physics Lists available in 9.3.b01

# Improvements of models

- **BERTini cascade** : improved cross-sections;  
higher multiplicity final-states;  
strange hadron production.
- **Fritiof** : further improved and tuned, based on  
thin-target data;  
FTF can be now coupled also to a 2-dimensional  
reggeon cascade + Precompound.
- **CHIPS** : as a model (so without cross-sections) it has  
been recently extended to all energies (for all  
hadrons and all materials);  
experimental Physics List **QGSC\_CHIPS**: QGS  
model with EnergyFlow interface to CHIPS at  
all energies.

# Summary & Outlook

- ❑ Comparisons between hadronic models provide useful hints on their validity range and it can guide on the choice of the transition regions, or even new mixtures between these models in Physics Lists.
- ❑ It is interesting to compare with non-Geant4 models, like Fluka, MCNPX, Dubna cascade, etc.
- ❑ We should not forget to look at several observables, not only the energy response!
- ❑ Work to do:
  - 1) More validations with thin-target data in 1-20 GeV
  - 2) Continue to improve/extend models
  - 3) Try to link model-level features to calorimeter observables

This requires a major effort of all G4 hadronic group!
