

# EXPERIMENTAL OVERVIEW

## HIGGS COUPLINGS AND SPIN/CP

PIERRE SAVARD  
(UNIVERSITY OF TORONTO AND TRIUMF)

HIGGS AND BEYOND  
(PITTSBURGH DEC. 2015)

# OUTLINE

## •Introduction

## •125 GeV Higgs Properties

- Mass
- Production and decay channels
- Spin/CP
- Width
- Higgs couplings
- Invisible width
- Differential cross sections

### Quarks

### Leptons

## •Conclusions and Outlook

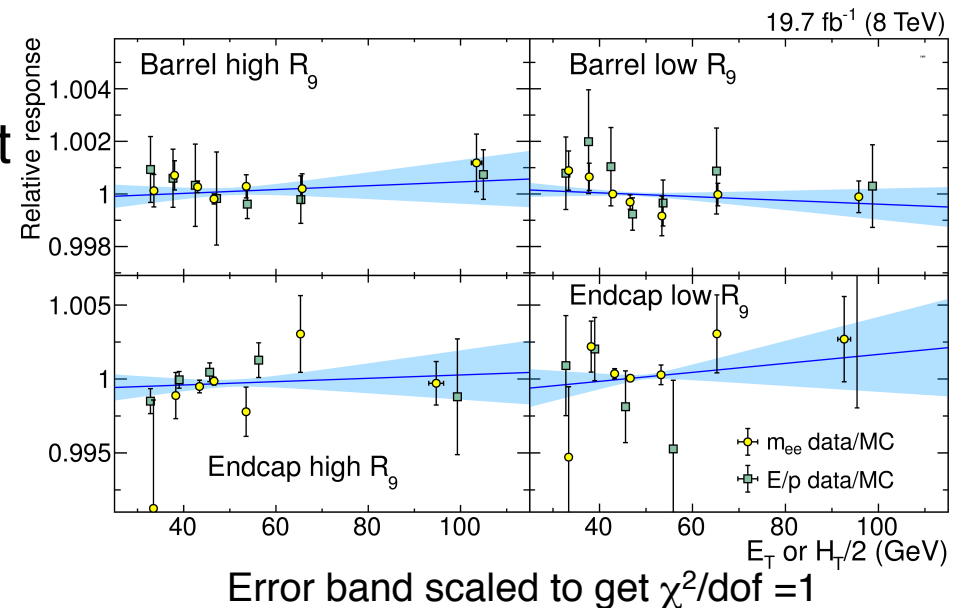

# INTRODUCTION

- First Run 1 Higgs results with full dataset were first presented in March of 2013

- In the last two years, detectors were re-calibrated, reconstruction and analysis techniques were improved, and the data were re-analyzed

- The final Run 1 results are in general significantly better than those presented in early 2013

- Legacy papers on couplings and spin CP by CMS were submitted a few months ago: Phys. Rev. D. 92.012004., Eur. Phys. J. C (2015) 75-212
- Final results on Higgs spin CP and couplings from ATLAS recently submitted: arxiv:1507.04548 (accepted), Eur. Phys. J. C75 (2015) 476
- Preliminary combination of ATLAS/CMS Higgs couplings: ATLAS-CONF-2015-044; CMS-PAS-HIG-15-002

Error band scaled to get  $\chi^2/\text{dof} = 1$   
CMS Photon Performance: CERN-PH-EP-2015-006

# SM HIGGS PHYSICS PROGRAM

Testing the SM Higgs hypothesis:

- Input: precision mass measurement
- Measurements of couplings
  - Main production modes
    - $ggH$ ,  $WH$ ,  $ZH$ ,  $VBF$ ,  $ttH$
  - Main decay modes:
    - $\gamma\gamma$ ,  $WW$ ,  $ZZ$ ,  $tt$ ,  $bb$
- Rare Decay modes:
  - $\mu\mu$ ,  $Z\gamma$ ,  $J/\psi \gamma$
- Rare production modes:
  - $tH$ ,  $hh$ ,  $bbH$
- Spin and CP-mixing properties
- Width
- Fiducial and differential measurements

# HIGGS MASS

The SM does not predict the Higgs boson mass: we need to measure it  
*(the last missing SM parameter!)*

Given a mass, we can make predictions\* for the production cross section and decay rates

Higgs mass measurements (GeV):

ATLAS:  $125.36 \pm 0.37$  (stat)  $\pm 0.18$  (syst)

CMS:  $125.02 \pm 0.27$  (stat)  $\pm 0.15$  (syst)

**LHC combination:**

$125.09 \pm 0.21$  (stat)  $\pm 0.11$  (syst)

Signal strength ( $\mu$ )

**Precision measurement:  $<0.2\%$**

\*a lot of progress by theory/MC community, LHCXSWG. Improvements continue...

# Impact of Higgs Mass Measurement on Electroweak Fits

[Eur. Phys. J. C 74, 3046 \(2014\)](#)

# Higgs Production at the LHC

	process	8 TeV	13 TeV
<b>ggF</b>	gluon-gluon fusion	19 pb	44 pb
<b>VBF</b>	vector-boson fusion	1.6 pb	3.7 pb
<b>VH</b>	associated production	1.1 pb	2.2 pb
<b>ttH</b>	associated production	0.13 pb	0.51 pb
<b>tH</b>	Associated production	$\sim 20$ fb	$\sim 90$ fb

**SM Production Modes**  
( $M_H = 125$  GeV)

# Higgs Production Modes

ggH and VBF well established  
(see ATLAS/CMS combination)

VH will have to wait for run 2 (but a close relative of VBF...)

ttH: strong evidence (see combination)

# HIGGS DECAYS

## SM Decay Modes ( $M_H = 125.1$ GeV)

Process	Br
$bb$	0.58
$WW$	0.22
$\tau\tau$	0.06
$ZZ$	0.027
$\gamma\gamma$	0.0023
$Z\gamma$	0.0016
$\mu\mu$	0.0002

- At  $m_H = 125$  GeV, many decay channels can be studied

# Main Production and Decays

Specific production and decay modes targeted by either ATLAS or CMS

	WW	ZZ	$\gamma\gamma$	bb	$\tau\tau$
ggH	X	X	X		X
VBF	X	X	X	X	X
WH	X	X	X	X	X
ZH	X	X	X	X	X
ttH	X	X	X	X	X

Represents an enormous amount of work

# Main Production and Decays

Specific production and decay modes targeted by either ATLAS or CMS

	WW	ZZ	$\gamma\gamma$	bb	$\tau\tau$
ggH	$\sigma_{\text{ggH}} * \text{BR}^{\text{WW}}$	$\sigma_{\text{ggH}} * \text{BR}^{\text{ZZ}}$	$\sigma_{\text{ggH}} * \text{BR}^{\gamma\gamma}$	$\sigma_{\text{ggH}} * \text{BR}^{\text{bb}}$	$\sigma_{\text{ggH}} * \text{BR}^{\tau\tau}$
VBF	$\sigma_{\text{VBF}} * \text{BR}^{\text{WW}}$	$\sigma_{\text{VBF}} * \text{BR}^{\text{ZZ}}$	$\sigma_{\text{VBF}} * \text{BR}^{\gamma\gamma}$	$\sigma_{\text{VBF}} * \text{BR}^{\text{bb}}$	$\sigma_{\text{VBF}} * \text{BR}^{\tau\tau}$
WH	$\sigma_{\text{WH}} * \text{BR}^{\text{WW}}$	$\sigma_{\text{WH}} * \text{BR}^{\text{ZZ}}$	$\sigma_{\text{WH}} * \text{BR}^{\gamma\gamma}$	$\sigma_{\text{WH}} * \text{BR}^{\text{bb}}$	$\sigma_{\text{WH}} * \text{BR}^{\tau\tau}$
ZH	$\sigma_{\text{ZH}} * \text{BR}^{\text{WW}}$	$\sigma_{\text{ZH}} * \text{BR}^{\text{ZZ}}$	$\sigma_{\text{ZH}} * \text{BR}^{\gamma\gamma}$	$\sigma_{\text{ZH}} * \text{BR}^{\text{bb}}$	$\sigma_{\text{ZH}} * \text{BR}^{\tau\tau}$
ttH	$\sigma_{\text{ttH}} * \text{BR}^{\text{WW}}$	$\sigma_{\text{ttH}} * \text{BR}^{\text{ZZ}}$	$\sigma_{\text{ttH}} * \text{BR}^{\gamma\gamma}$	$\sigma_{\text{ttH}} * \text{BR}^{\text{bb}}$	$\sigma_{\text{ttH}} * \text{BR}^{\tau\tau}$

Signal yields proportional to  $\sigma_{\text{Prod.}} * \text{BR}^{\text{Decay}}$

# Main Production and Decays

Using ratios, we can isolate production vs decay

	WW	ZZ/WW	$\gamma\gamma$ /WW	bb/WW	$\tau\tau$ /WW
ggH	$\sigma_{ggH} * BR^{WW}$				
VBF/ ggH					
WH/ ggH					
ZH/ ggH					
ttH/ ggH					

# 5 $\sigma$ OBSERVATION IN $\gamma\gamma$ , ZZ AND WW DECAYS

# DECAYS TO FERMIONS ( $\tau\tau$ )

Significance obs. (exp.) in ATLAS/CMS combination: 5.5 (5.0)

**CMS:**

• 3.2 (3.7)  $\sigma$

**ATLAS:**

• 4.5 (3.4)  $\sigma$

# DECAYS TO FERMIONS (bb)

Significance obs. (exp.) in ATLAS/CMS combination: 2.6 (3.7)

**CMS(VH+VBF+ttH):**

• 2.6 (2.7)  $\sigma$

**Tevatron(VH)\*\*:**

• 2.2 (1.4)  $\sigma$

**ATLAS(VH+ttH):**

• 1.8 (2.8)  $\sigma$

\*\*my estimate from: Phys. Rev. D 88, 052014 (2013)

# ttH Associated Production

Test Yukawa coupling of the top quark (large!  
~1.0 in the SM)

Production cross section is small (<1% of ggH)  
but spectacular final state

Very large top background...

Combination of signal strengths:

CMS:  $\mu = 2.8 \pm 1.0$

ATLAS:  $\mu = 1.8 \pm 0.8$

# ttH Associated Production

Test Yukawa coupling of the top quark (large!  
~1.0 in the SM)

Production cross section is small (<1% of ggH)  
but spectacular final state

Very large top background...

ATLAS/CMS combination:  
significance obs (exp): 4.4 (2.0)

# ttH Associated Production

Test Yukawa coupling of the top quark ( $\sim 1.0$  in the SM)

Production cross section is small ( $< 1\%$  of ggH) but spectacular final state

Very large top background...

Combination of signal strengths:

$$\mu = 2.3^{+0.7}_{-0.6}$$

# STATUS OF SM RARE DECAYS

Searches for rare decays  
performed in various channels

Observation of these decays in  
Run 1 would signal BSM  
physics

Non-universal coupling of Higgs  
to leptons:

- $\mu\mu$  signal would be 280 times  
larger than SM if  $\mu$  coupling was  
equal to that of  $\tau$

Process	limit (times SM)
$\mu\mu$ (ATLAS)	7.0
$\mu\mu$ (CMS)	7.4
$Z\gamma$ (ATLAS)	11
$Z\gamma$ (CMS)	9
$\gamma\gamma^*$ (CMS)	7.7
$J/\psi\gamma$ (ATLAS)	540
$J/\psi\gamma$ (CMS)	540
$ee$ (CMS)	$10^5$

# SPIN/CP HYPOTHESES TESTS

Tests of spin/CP properties performed in  $ZZ$ ,  $\gamma\gamma$ ,  $WW$  channels

$ZZ$ : full kinematic information available for spin/CP determination

WW spin information from kinematic variables

$\gamma\gamma$ : use  $\cos(\theta^*)$

$\gamma\gamma$

# FIXED SPIN AND PARITY TESTS

Test alternative fixed spin and parity hypotheses relative to the SM  $0^+$  hypothesis

Results favour the spin  $0^+$  hypothesis

Alternatives:  $0^-$ ,  $1^-$ ,  $1^+$ , various spin 2 models are typically excluded at  $> 99.9\%$  CL

Large anomalous couplings are excluded. Next step: look for presence of smaller contributions

$$\tilde{q} = \log \frac{\mathcal{L}(J_{\text{SM}}^P, \hat{\mu}_{J_{\text{SM}}^P}, \hat{\theta}_{J_{\text{SM}}^P})}{\mathcal{L}(J_{\text{alt}}^P, \hat{\mu}_{J_{\text{alt}}^P}, \hat{\theta}_{J_{\text{alt}}^P})}$$

Also Tevatron results:  
PRL 114, 151802 (2015)

# CP MIXING RESULTS

Probe potential CP-mixing and tensor structure of Higgs interactions

- Amplitude describing interaction between a spin 0 and two spin 1 particles used by CMS:

$$A(\text{HVV}) \sim \underbrace{\left[ a_1^{\text{VV}} + \frac{\kappa_1^{\text{VV}} q_{\text{V}1}^2 + \kappa_2^{\text{VV}} q_{\text{V}2}^2}{(\Lambda_1^{\text{VV}})^2} \right]}_{\text{SM}} m_{\text{V}1}^2 \epsilon_{\text{V}1}^* \epsilon_{\text{V}2}^* + \underbrace{a_2^{\text{VV}} f_{\mu\nu}^{*(1)} f^{*(2),\mu\nu}}_{\text{BSM CP-even}} + \underbrace{a_3^{\text{VV}} f_{\mu\nu}^{*(1)} \tilde{f}^{*(2),\mu\nu}}_{\text{BSM CP-odd}}$$

ATLAS: different formulation (see next slide), but results can be compared

**No significant contributions from BSM terms are observed (see next slides)**

BSM CP-even (95% CL)

CMS  $f_{a2} \cos(\phi_{a2}) \in [-0.11, 0.17]$

ATLAS  $f_{a2} < 0.12$  for  $\phi_{a2} = 0$

$f_{a2} < 0.16$  for  $\phi_{a2} = \pi$

BSM CP-odd (95% CL)

CMS  $f_{a3} \cos(\phi_{a3}) \in [-0.27, 0.28]$

ATLAS  $f_{a3} < 0.090$  for  $\phi_{a3} = 0$

$f_{a3} < 0.41$  for  $\phi_{a3} = \pi$

# CMS CP MIXING RESULTS

Probe potential CP-mixing and tensor structure of Higgs interactions

•Amplitude describing interaction between a spin 0 and two spin 1 particles:

$$A(\text{HVV}) \sim \left[ a_1^{\text{VV}} + \frac{\kappa_1^{\text{VV}} q_{\text{V}1}^2 + \kappa_2^{\text{VV}} q_{\text{V}2}^2}{(\Lambda_1^{\text{VV}})^2} \right] m_{\text{V}1}^2 \epsilon_{\text{V}1}^* \epsilon_{\text{V}2}^* + a_2^{\text{VV}} f_{\mu\nu}^{*(1)} f^{*(2),\mu\nu} + a_3^{\text{VV}} f_{\mu\nu}^{*(1)} \tilde{f}^{*(2),\mu\nu}$$

$$f_{\Lambda 1} = \frac{\tilde{\sigma}_{\Lambda 1} / (\Lambda_1)^2}{|a_1|^2 \sigma_1 + |a_2|^2 \sigma_2 + |a_3|^2 \sigma_3 + \tilde{\sigma}_{\Lambda 1} / (\Lambda_1)^4 + \dots}, \quad \phi_{\Lambda 1},$$

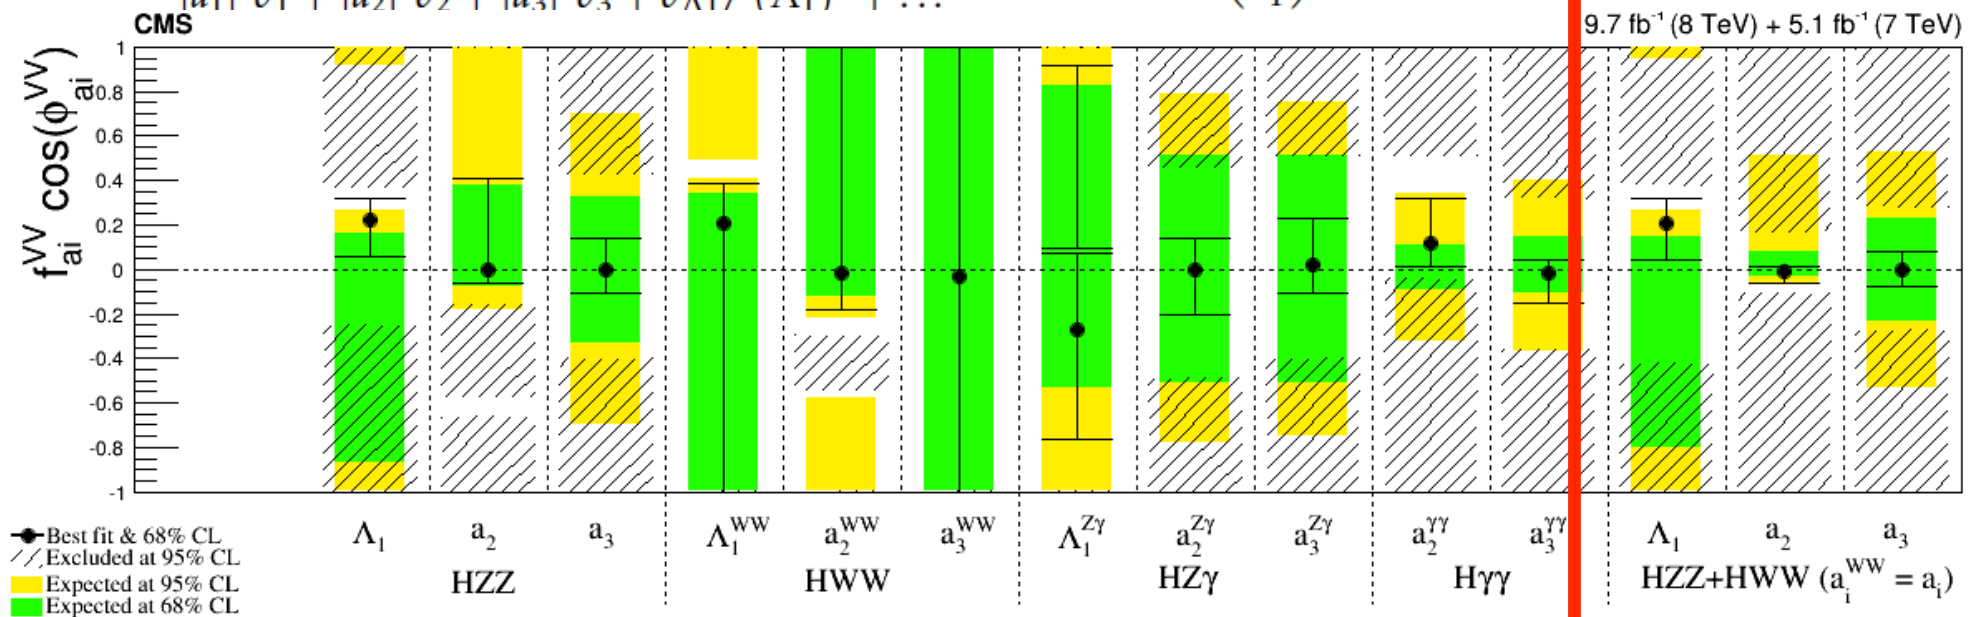

$$f_{a 2} = \frac{|a_2|^2 \sigma_2}{|a_1|^2 \sigma_1 + |a_2|^2 \sigma_2 + |a_3|^2 \sigma_3 + \tilde{\sigma}_{\Lambda 1} / (\Lambda_1)^4 + \dots}, \quad \phi_{a 2} = \arg \left( \frac{a_2}{a_1} \right)$$

$$f_{a 3} = \frac{|a_3|^2 \sigma_3}{|a_1|^2 \sigma_1 + |a_2|^2 \sigma_2 + |a_3|^2 \sigma_3 + \tilde{\sigma}_{\Lambda 1} / (\Lambda_1)^4 + \dots}, \quad \phi_{a 3} = \arg \left( \frac{a_3}{a_1} \right)$$

$\sigma_i$  : xs for  $a_i = 1$

$\Lambda_1 = 1 \text{ TeV}$

Phys Rev D. 89.035007

# ATLAS CP MIXING RESULTS

Lagrangian describing interaction between a spin 0 and a pair of W or Z bosons (from JHEP 1311 (2013) 043):

$$\mathcal{L}_0^V = \left\{ c_\alpha \kappa_{\text{SM}} \left[ \frac{1}{2} g_{HZZ} Z_\mu Z^\mu + g_{HWW} W_\mu^+ W^{-\mu} \right] - \frac{1}{4} \frac{1}{\Lambda} \left[ c_\alpha \kappa_{HZZ} Z_{\mu\nu} Z^{\mu\nu} + s_\alpha \kappa_{AZZ} Z_{\mu\nu} \tilde{Z}^{\mu\nu} \right] - \frac{1}{2} \frac{1}{\Lambda} \left[ c_\alpha \kappa_{HWW} W_{\mu\nu}^+ W^{-\mu\nu} + s_\alpha \kappa_{AWW} W_{\mu\nu}^+ \tilde{W}^{-\mu\nu} \right] \right\} X_0.$$

$J^P$	Model	Choice of tensor couplings			
		$\kappa_{\text{SM}}$	$\kappa_{HVV}$	$\kappa_{AVV}$	$\alpha$
$0^+$	Standard Model Higgs boson	1	0	0	0
$0_h^+$	BSM spin-0 CP-even	0	1	0	0
$0^-$	BSM spin-0 CP-odd	0	0	1	$\pi/2$

**No significant contributions from BSM terms are observed**

# WIDTH AND LIFETIME

SM width ( $m_H=125.1$  GeV): 4.1 MeV

Higgs width measurements at LHC:

- **Direct** (limit at 95% CL obs. (exp.))
  - $\sim 2$  GeV from ATLAS and CMS ( $\gamma\gamma, ZZ$ ):
- **Interference in  $\gamma\gamma$  (signal – continuum)**
  - Expected mass shift  $\sim 40$  MeV for SM
  - No assumptions but small effect
- **Lifetime:**  $\Gamma(H) > 3.9 \times 10^{-9}$  MeV (CMS)

• **Via off-shell couplings:**

Direct measurement of Off Shell couplings (independent of width)

- Measure width assuming SM running (or measure running assuming width)

Assuming\*  $\mu_{\text{OffShell}} = \mu_{\text{OnShell}}$

- CMS: 22 (33) MeV (95%CL)
- ATLAS: 23 (33) MeV (95%CL)

at HL-LHC\*:

$$\Gamma = 4.1^{+1.5}_{-2.1} \text{ MeV}$$

\*ATL-PHYS-PUB-2013-014

# COMBINATION OF SIGNAL STRENGTHS

- We measure event yields  $n_{evt}$  and we need to extract signal yields  $n_s$
- Estimate and subtract backgrounds

$$n_s = n_{evt} - n_{bkg}$$

- Production mode categories  $c$  are contaminated by other signal processes
- Global fit to all categories can take into account all contributions and correlations

We extract the signal strength  $\mu$  : ratio of the observed yield to the SM prediction

$$n_s^{c,i} = \sum_p \left[ \mu^p \mu_{BR}^i \right] \times (\sigma^p \times Br^i)_{SM} \times A_p^{c,i} \times \epsilon_p^{c,i} \times Lumi$$

$$p \in (ggF, VBF, VH, ttH) \quad i \in (\gamma\gamma, ZZ, WW, bb, \tau\tau)$$

# ATLAS/CMS Combination

Signal strength: 
$$\mu_i^f = \frac{\sigma_i \cdot \text{BR}^f}{(\sigma_i)_{\text{SM}} \cdot (\text{BR}^f)_{\text{SM}}} = \mu_i \times \mu^f$$

Use parametrization that constrains production and decay signal strengths to be the same:

$$\mu = 1.09_{-0.10}^{+0.11} = 1.09_{-0.07}^{+0.07} \text{ (stat)} \text{ }_{-0.04}^{+0.04} \text{ (expt)} \text{ }_{-0.03}^{+0.03} \text{ (thbgd)}_{-0.06}^{+0.07} \text{ (thsig)}$$

**Theory uncertainties equal to statistical uncertainties**

- Recent improvements will help (but we can be more clever too)

**Overall systematic uncertainty larger than statistical uncertainty**

# ATLAS/CMS Combination

## Production Signal Strengths

## Decay Signal Strengths

# COUPLINGS FRAMEWORK

- $y_b := \kappa_b y_b^{\text{SM}}$

assuming no BSM particles in the loops

$$\kappa_g^2 \propto 1.06 \times \kappa_t^2 - 0.07 \times \kappa_t \kappa_b + 0.01 \times \kappa_b^2$$

$$\kappa_\gamma^2 \propto 1.6 \times \kappa_W^2 - 0.7 \times \kappa_t \kappa_W + 0.1 \times \kappa_t^2$$

• “ $\kappa$  framework”: interpret signal strength parameters ( $\mu_p$ ,  $\mu_{\text{BR}}^i$ ) in terms of modifiers to the SM couplings:

- Decay:  $\Gamma_i = \kappa_i^2 \Gamma_i^{\text{SM}}$
- Production:  $\sigma_i = \kappa_i^2 \sigma_i^{\text{SM}}$
- Width:  $\Gamma_H = \sum_i \kappa_i^2 \Gamma_i^{\text{SM}}$

Assumptions (see LHCXSWG YR3):

- Only one Higgs
- SM production and decay kinematics
  - Tensor structure is that of SM
  - 0+ scalar
- Narrow resonance

# ATLAS/CMS Combination

## Test gauge vs Yukawa couplings

### • Assumptions:

- Common scaling factor for fermions and gauge bosons:
  - $\kappa_F$  and  $\kappa_V$
- No BSM contributions to width
- No BSM contributions to loops

• Interference in  $\gamma\gamma$ ,  $tH$ ,  $gg \rightarrow ZH$   
can resolve relative sign between  $\kappa_F$  and  $\kappa_V$

• Results compatible with SM

# ATLAS/CMS COMBINATION

Sensitivity to sign of  $k_F^f$  due to  $H \rightarrow \gamma\gamma$  decay,  $gg \rightarrow ZH$  and  $tH$  production (in  $WW$  and  $b\bar{b}$ )

# COUPLINGS WITH SM PARTICLE CONTENT

“Absolute couplings”. Assumptions:

- No contributions to width from BSM particles
- No contributions to loops from BSM particles

• Why are the  $\kappa$  values low when the global  $\mu$  is 1.09?

$$\sigma_i \cdot \text{BR}^f = \frac{\sigma_i(\vec{k}) \cdot \Gamma^f(\vec{k})}{\Gamma_H}$$

$$\Gamma_H = \frac{\kappa_H^2 \cdot \Gamma_H^{\text{SM}}}{1 - \text{BR}_{\text{BSM}}}$$

$$\kappa_H^2 \sim \frac{0.57 \cdot \kappa_b^2 + 0.22 \cdot \kappa_W^2 + 0.09 \cdot \kappa_g^2 + 0.06 \cdot \kappa_\tau^2 + 0.03 \cdot \kappa_Z^2 + 0.03 \cdot \kappa_c^2 + 0.0023 \cdot \kappa_\gamma^2 + 0.0016 \cdot \kappa_{Z\gamma}^2 + 0.0001 \cdot \kappa_s^2 + 0.00022 \cdot \kappa_\mu^2}{1 - \text{BR}_{\text{BSM}}}$$

Low value of  $\kappa_b$  reduces total width

# UP/DOWN AND LEPTON/QUARK COUPLINGS

Check coupling ratios between up-type and down-type fermions (left) and quarks and leptons (right)

- motivated by e.g. two Higgs doublet scenarios

# NEW PHYSICS IN LOOPS?

Test for “heavy” BSM physics (BSM particles  $> m_H/2$ ) with possible contributions to  $ggH$ ,  $H\gamma\gamma$  (and  $HZ\gamma$ ) loops, or “light” physics in the decay loop

- Assume SM couplings for known particles

$$\frac{(\sigma \cdot \text{BR})(gg \rightarrow H \rightarrow \gamma\gamma)}{\sigma_{\text{SM}}(gg \rightarrow H) \cdot \text{BR}_{\text{SM}}(H \rightarrow \gamma\gamma)} = \frac{\kappa_g^2 \cdot \kappa_\gamma^2}{\kappa_H^2}$$

# INVISIBLE DECAYS: DIRECT SEARCHES

SM BR to invisible: 0.1% ( $ZZ \rightarrow 4\nu$ )

Weak vector boson fusion is the most sensitive production mode

• Require  $E_T$  Miss and VBF signature:

- Large separation between jets in  $\eta$
- Large  $m_{jj}$

• Results (95% CL) on BR:

- ATLAS: 28% (31% exp.)
- CMS: 58 % (40% exp.)

• Combination of all channels:

- ATLAS:  $BR(inv) < 25\%$  (27% exp.) at 95% CL
- CMS:  $BR(inv) < 36\%$  (30% exp.) at 95% CL

# MOST GENERAL FIT

- No assumptions on particle content in loops
- No assumptions on BSM decay or Higgs width

• Drawback: can only fit ratios

Theory uncertainties  
are reduced

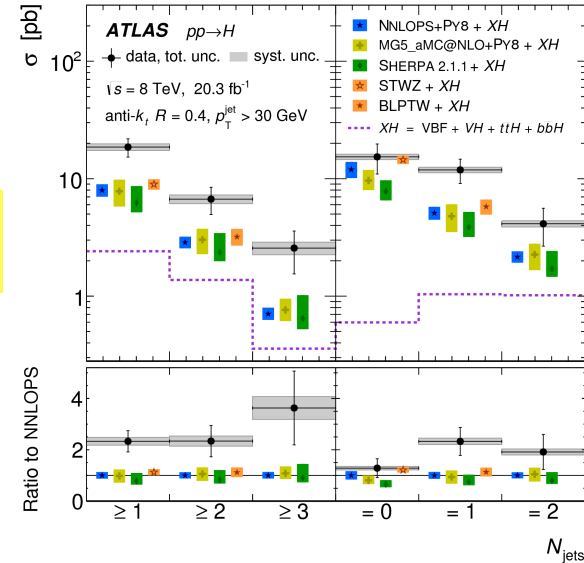

# DIFFERENTIAL CROSS SECTIONS (ATLAS)

SM Higgs theory predictions for kinematics: combination of  $\gamma\gamma$  and  $ZZ$

$p_T(H)$

$N_{\text{jets}}$

$|y|(H)$

$p_T(j_1)$

# DIFFERENTIAL CROSS SECTIONS AND EFT

- Study tensor structure and strength of Higgs interactions in the context of an effective Lagrangian framework
- Use Strongly Interacting Light Higgs (SILH) formulation:

$$\mathcal{L} = \bar{c}_\gamma O_\gamma + \bar{c}_g O_g + \bar{c}_{HW} O_{HW} + \bar{c}_{HB} O_{HB} + \bar{c}_\gamma \tilde{O}_\gamma + \bar{c}_g \tilde{O}_g + \bar{c}_{HW} \tilde{O}_{HW} + \bar{c}_{HB} \tilde{O}_{HB}$$

Statistical combination of 5  $\gamma\gamma$  input variables:

EFT papers:  
JHEP 07(2015) 035  
JHEP 06(2007) 045

# Run 3 and Beyond

Ongoing studies of Higgs physics potential at high luminosity

**ATLAS Simulation Preliminary**

$\sqrt{s} = 14 \text{ TeV}$ :  $\int L dt = 300 \text{ fb}^{-1}$  ;  $\int L dt = 3000 \text{ fb}^{-1}$

# CONCLUSIONS

- A lot of progress made since the discovery 3 years ago
  - The measurements of the production and decay properties of the Higgs boson are consistent with SM predictions
    - The SM  $0^+$  hypothesis is preferred over all other tested spin/parity alternatives (almost all excluded at  $> 95\%$  CL)
    - Coupling strengths consistent with SM
  - No evidence of BSM physics in the scalar sector (yet...)
- Improving the Run 1 results significantly will require a substantial dataset and a lot of work on both the experimental and theory/MC modeling side
- We have a very exciting and challenging Higgs physics program for Run II

# **Backup Slides**

# STATUS OF RARE SM DECAYS: $\mu\mu$

$\mu^+ \mu^-$  analysis:

- 2 analysis channels (ggF and VBF)
- Analytic background model (similar to  $\gamma\gamma$ )

**Results at 95% CL:**

$$\sigma \cdot \text{Br} < 7.0 \text{ (7.2)} (\sigma \cdot \text{Br})_{\text{SM}}$$

Universal couplings (same as  $\tau$  lepton)  
 would imply signal  $\sim 280$  times SM

PLB

PLB 732 (2014)

**Results at 95% CL :**

$$\sigma \cdot \text{Br} < 7.4 \text{ (6.5)} (\sigma \cdot \text{Br})_{\text{SM}}$$

# STATUS OF RARE SM DECAYS: $Z\gamma$

## $Z\gamma$ analysis strategy

- Detector and  $p_T$  categories
- Analytic background model (similarly to  $\gamma\gamma$ )

**Results at 95% CL:**

$$\sigma \cdot \text{Br} < 9 \text{ (9)} (\sigma \cdot \text{Br})_{\text{SM}}$$

**Results, 95% CL:**

$$\sigma \cdot \text{Br} < 11 \text{ (9)} (\sigma \cdot \text{Br})_{\text{SM}}$$

PLB 732 (2014)

# CMS CP MIXING RESULTS

Probe potential CP-mixing and tensor structure of Higgs interactions

•Amplitude describing interaction between a spin 0 and two spin 1 particles:

$$A(\text{HVV}) \sim \left[ a_1^{\text{VV}} + \frac{\kappa_1^{\text{VV}} q_{\text{V}1}^2 + \kappa_2^{\text{VV}} q_{\text{V}2}^2}{(\Lambda_1^{\text{VV}})^2} \right] m_{\text{V}1}^2 \epsilon_{\text{V}1}^* \epsilon_{\text{V}2}^* + a_2^{\text{VV}} f_{\mu\nu}^{*(1)} f^{*(2),\mu\nu} + a_3^{\text{VV}} f_{\mu\nu}^{*(1)} \tilde{f}^{*(2),\mu\nu}$$

$$f_{a2} = \frac{|a_2|^2 \sigma_2}{|a_1|^2 \sigma_1 + |a_2|^2 \sigma_2 + |a_3|^2 \sigma_3 + \tilde{\sigma}_{\Lambda 1} / (\Lambda_1)^4 + \dots}, \quad \phi_{a2} = \arg \left( \frac{a_2}{a_1} \right)$$

$$f_{a3} = \frac{|a_3|^2 \sigma_3}{|a_1|^2 \sigma_1 + |a_2|^2 \sigma_2 + |a_3|^2 \sigma_3 + \tilde{\sigma}_{\Lambda 1} / (\Lambda_1)^4 + \dots}, \quad \phi_{a3} = \arg \left( \frac{a_3}{a_1} \right)$$

$\sigma_i$  : xs for  $a_i = 1$

$\Lambda_1 = 1 \text{ TeV}$

Phys Rev D. 89.035007

# ATLAS CP MIXING RESULTS

Lagrangian describing interaction between a spin 0 and a pair of W or Z bosons (from JHEP 1311 (2013) 043):

$$= \mathcal{L}_0^V = \left\{ c_\alpha \kappa_{\text{SM}} \left[ \frac{1}{2} g_{HZZ} Z_\mu Z^\mu + g_{HWW} W_\mu^+ W^{-\mu} \right] - \frac{1}{4} \frac{1}{\Lambda} \left[ c_\alpha \kappa_{HZZ} Z_{\mu\nu} Z^{\mu\nu} + s_\alpha \kappa_{AZZ} Z_{\mu\nu} \tilde{Z}^{\mu\nu} \right] - \frac{1}{2} \frac{1}{\Lambda} \left[ c_\alpha \kappa_{HWW} W_{\mu\nu}^+ W^{-\mu\nu} + s_\alpha \kappa_{AWW} W_{\mu\nu}^+ \tilde{W}^{-\mu\nu} \right] \right\} X_0.$$

$J^P$	Model	Choice of tensor couplings			
		$\kappa_{\text{SM}}$	$\kappa_{HVV}$	$\kappa_{AVV}$	$\alpha$
$0^+$	Standard Model Higgs boson	1	0	0	0
$0_h^+$	BSM spin-0 CP-even	0	1	0	0
$0^-$	BSM spin-0 CP-odd	0	0	1	$\pi/2$

CMS/ATLAS comparison

**No significant contributions from BSM terms are observed**

ATLAS paper: JHEP 1311 (2013) 043

**BSM CP-even (95% CL)**

CMS  $f_{a2} \cos(\phi_{a2}) \in [-0.11, 0.17]$

ATLAS  $f_{a2} < 0.12$  for  $\phi_{a2} = 0$   
 $f_{a2} < 0.16$  for  $\phi_{a2} = \pi$

**BSM CP-odd (95% CL)**

CMS  $f_{a3} \cos(\phi_{a3}) \in [-0.27, 0.28]$

ATLAS  $f_{a3} < 0.090$  for  $\phi_{a3} = 0$   
 $f_{a3} < 0.41$  for  $\phi_{a3} = \pi$

# WIDTH: LIFETIME AND OFF-SHELL COUPLINGS (CMS)

SM lifetime ( $m_H = 125$  GeV):  $1.6 \times 10^{-7}$  fs

Measure flight distance in the detector  
using  $H \rightarrow ZZ \rightarrow 4\ell$  channel  
 $\tau(H) < 190$  fs at 95% CL  
 $\Gamma(H) > 3.9 \times 10^{-9}$  MeV

Enhancement of off-shell production possible through anomalous HVV couplings:

$$A(\text{HVV}) \propto \left[ a_1 - e^{i\phi_{\Lambda Q}} \frac{(q_{V1} + q_{V2})^2}{(\Lambda_Q)^2} - e^{i\phi_{\Lambda 1}} \frac{(q_{V1}^2 + q_{V2}^2)}{(\Lambda_1)^2} \right] m_V^2 \epsilon_{V1}^* \epsilon_{V2}^* + a_2 f_{\mu\nu}^{*(1)} f^{*(2),\mu\nu} + a_3 f_{\mu\nu}^{*(1)} \tilde{f}^{*(2),\mu\nu},$$

Width derived with/without profiling of cross section fraction:

$$f_{\Lambda Q} = \frac{m_H^4 / \Lambda_Q^4}{|a_1|^2 + m_H^4 / \Lambda_Q^4}$$
