# Expectations and opportunities for the run 2 of the LHC

Invisibles I 5 Workshop
"Invisibles Meets Visibles"
IFT
Madrid, June 22-26 2015

Michelangelo L. Mangano

TH Unit, Physics Department, CERN michelangelo.mangano@cern.ch

• We've seen the Higgs:

- We've seen the Higgs:
  - how much more can we learn about its properties, about EW symmetry breaking?

- We've seen the Higgs:
  - how much more can we learn about its properties, about EW symmetry breaking?
  - .... where is everyone else? hiding well, or beyond reach?

- We've seen the Higgs:
  - how much more can we learn about its properties, about EW symmetry breaking?
  - .... where is everyone else? hiding well, or beyond reach?
- We model SM dynamics in multi-TeV pp collisions rather well:

- We've seen the Higgs:
  - how much more can we learn about its properties, about EW symmetry breaking?
  - .... where is everyone else? hiding well, or beyond reach?
- We model SM dynamics in multi-TeV pp collisions rather well:
  - how far can we go with our precision? can "precision" become a discovery tool?

- We've seen the Higgs:
  - how much more can we learn about its properties, about EW symmetry breaking?
  - .... where is everyone else? hiding well, or beyond reach?
- We model SM dynamics in multi-TeV pp collisions rather well:
  - how far can we go with our precision? can "precision" become a discovery tool?
  - what's the ultimate systematics we can hope to achieve and its impact on precision measurements (e.g. of the Higgs) or BSM searches (e.g. of elusive signatures)?

- We've seen the Higgs:
  - how much more can we learn about its properties, about EW symmetry breaking?
  - .... where is everyone else? hiding well, or beyond reach?
- We model SM dynamics in multi-TeV pp collisions rather well:
  - how far can we go with our precision? can "precision" become a discovery tool?
  - what's the ultimate systematics we can hope to achieve and its impact on precision measurements (e.g. of the Higgs) or BSM searches (e.g. of elusive signatures)?
- We've seen experiments open new paths for themselves:

  - LHCb compete with ATLAS/CMS for W/Z production, PDF fits, top etc
  - CMS and TOTEM work together to explore new roads (central diffraction, ....)
  - how much richer and broader can the physics programme become? which new surprises?

# some examples, off the beaten path of higgs, susy etc

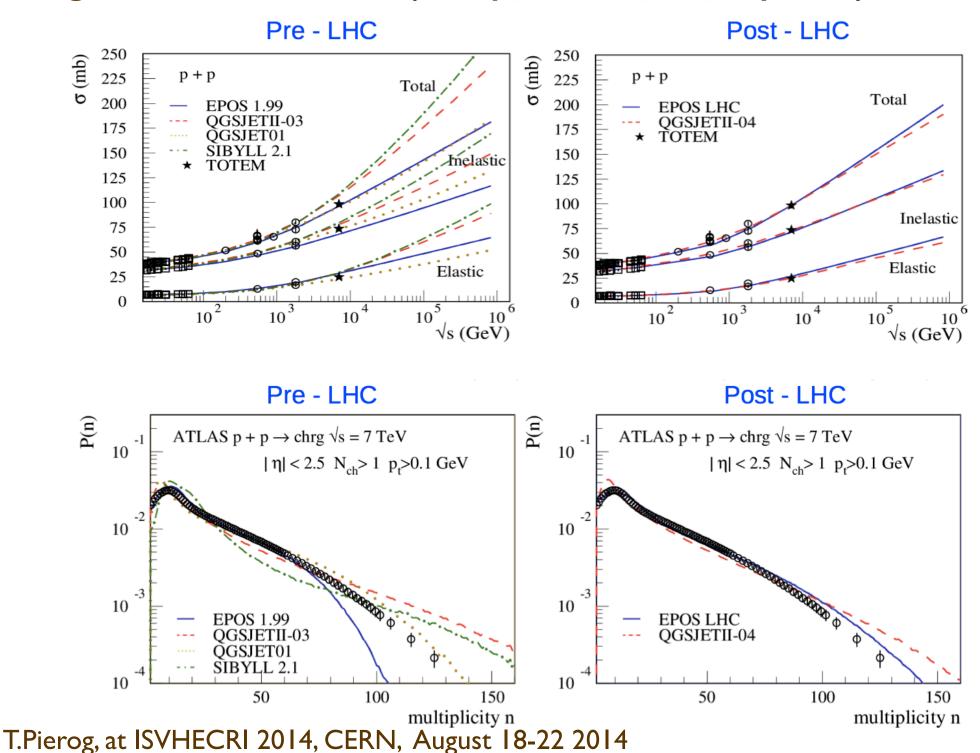

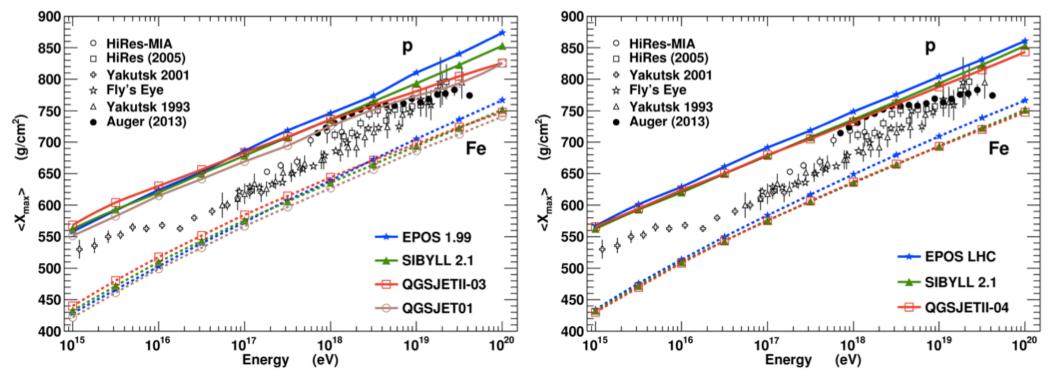

### **LHC & CRs**

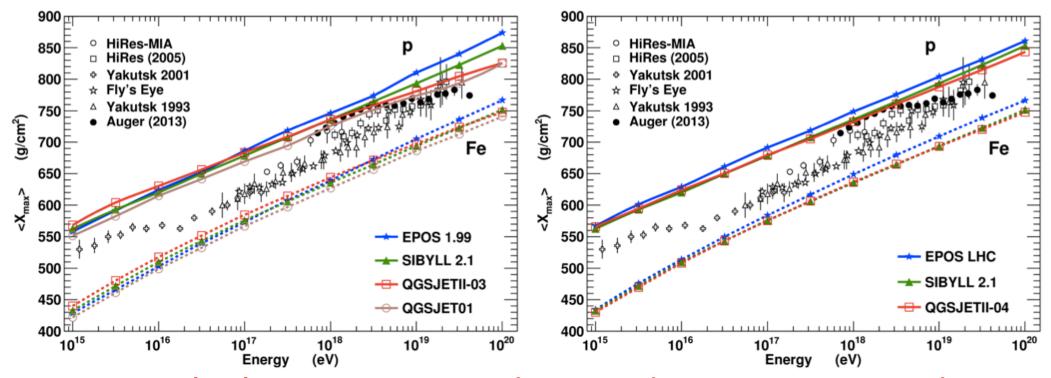

### Tuning CR MCs with LHC data (mostly from the first few $pb^{-1}$ ....)

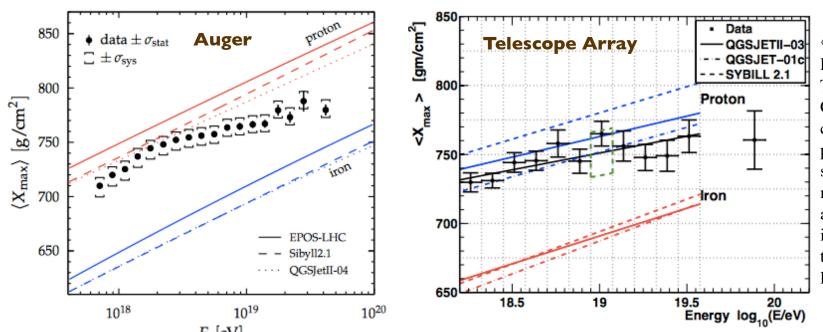

Uncertainty on  $\langle X_{max} \rangle$  reduced from ~50 g/cm<sup>2</sup> to ~20 g/cm<sup>2</sup> ([proton – iron]~100 g/cm<sup>2</sup>)

Uncertainty on  $\langle X_{max} \rangle$  reduced from ~50 g/cm<sup>2</sup> to ~20 g/cm<sup>2</sup> ( [proton – iron]~100 g/cm<sup>2</sup>)

⟨Xmax⟩ as measured by the Pierre Auger (left) and Telescope Array (right) Collaboration [2, 3]. The colored lines denote predictions of air shower simulation (note that different models are shown in the left and right panel, only Sibyll2.1 is the same). The black line on the right panel is a straight-line fit to the TA data.

Auger and Telescope Array WG, arXiv: I 503.07540

### **Glueballs**

### Run I, evidence of sensitivity to $f_0(1710) \rightarrow \rho^0 \ \rho^0$ from $3nb^{-1}$ joint CMS/TOTEM

- $f_0(1710), 0^{++}$  glueball candidate
- No info on production rate in gg channel
- Conflicting knowledge (B factories, Zeus) on:
  - mass
  - decay BRs to u/d vs strange mesons (crucial to assess consistency with glueball interpretation):  $\pi\pi$ ,  $\rho\rho$ , KK

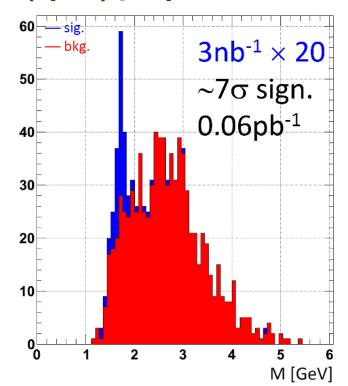

### **Glueballs**

### Run I, evidence of sensitivity to $f_0(1710) \rightarrow \rho^0 \rho^0$ from $3nb^{-1}$ joint CMS/TOTEM

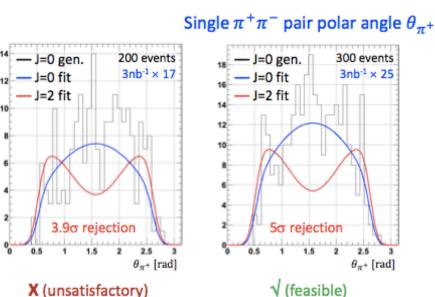

- $f_0(1710), 0^{++}$  glueball candidate
- No info on production rate in gg channel
- Conflicting knowledge (B factories, Zeus) on:
  - mass
  - decay BRs to u/d vs strange mesons (crucial to assess consistency with glueball interpretation):  $\pi\pi$ ,  $\rho\rho$ , KK

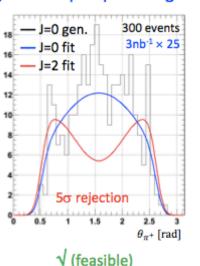

#### Run2 projections:

 $0.05pb^{-1}$  for discovery,  $O(1pb^{-1})$  for BR measurements and first angular analysis,  $O(5pb^{-1})$  for partial wave analysis in full mass range (40 MeV bins)

- $f \rightarrow \rho \rho \rightarrow 2\pi + 2\pi$ , acceptance modelled
- *I* = 0 generated, *I* = 0 and *I* = 2 fitted

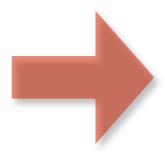

# Status of BSM after run l

# Status of BSM after run l

see most other talks today and during the week ....

" Having found that:

### " Having found that :

• The observation of the Higgs where the SM predicted it would be, its SM-like properties, and the lack of BSM phenomena up to the TeV scale, make the *naturalness issue more puzzling than ever* 

### " Having found that:

- The observation of the Higgs where the SM predicted it would be, its SM-like properties, and the lack of BSM phenomena up to the TeV scale, make the **naturalness issue more puzzling than ever**
- Whether to keep believing in the MSSM or other specific BSM theories after LHC@8TeV is a matter of personal judgement. But the broad issue of *naturalness will ultimately require an understanding*.

### " Having found that:

- The observation of the Higgs where the SM predicted it would be, its SM-like properties, and the lack of BSM phenomena up to the TeV scale, make the **naturalness issue more puzzling than ever**
- Whether to keep believing in the MSSM or other specific BSM theories after LHC@8TeV is a matter of personal judgement. But the broad issue of naturalness will ultimately require an understanding.
- Naturalness remains a guiding principle to drive the search of new phenomena at the LHC

### " Having found that:

- Whether to keep believing in the MSSM or other specific BSM theories after LHC@8TeV is a matter of personal judgement. But the broad issue of *naturalness will ultimately require an understanding*.
- **Naturalness remains a guiding principle** to drive the search of new phenomena at the LHC

..... I shall remain faithful to the hope that SUSY will soon show up .... "

### Anomalies / pending items from run I, some examples

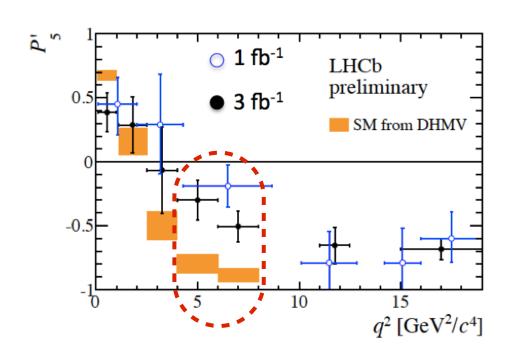

$$Br[h \to \mu \tau] = (0.89^{+0.40}_{-0.37}) \%$$

CMS-PAS-HIG-14-005

#### stat syst

$$R(K) = \frac{B \to K \mu^+ \mu^-}{B \to K e^+ e^-} = 0.745^{+0.090}_{-0.074} \pm 0.036$$

LHCb, arXiv:1406.6482

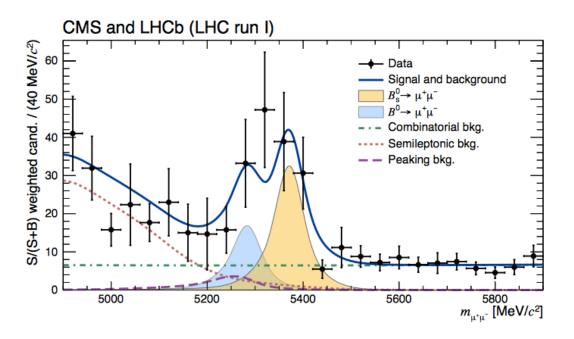

•B  $\rightarrow$  K\* $\mu$ + $\mu$ - anomaly

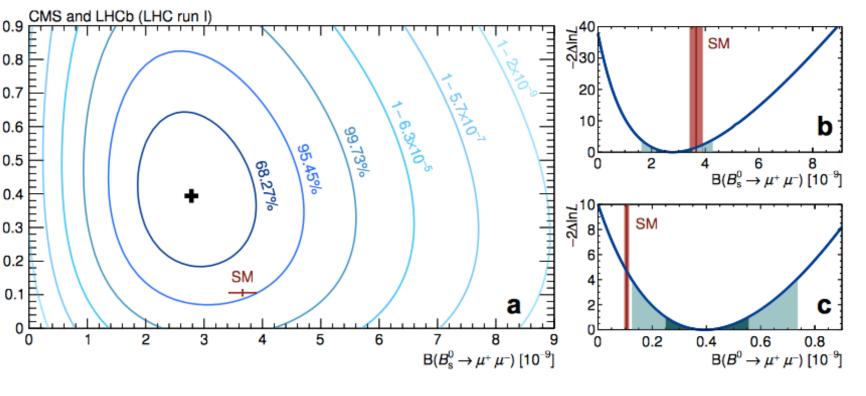

LHCb, arXiv:1308.1707 and 3fb<sup>-1</sup> update LHCb-CONF-2015-002

For possible interpretation within a single BSM model see e.g. Crivellin, D'Ambrosio, Heeck, arXiv: I 50 I .00993 (2HDM w. gauged  $L_{\mu}$ – $L_{\tau}$ )

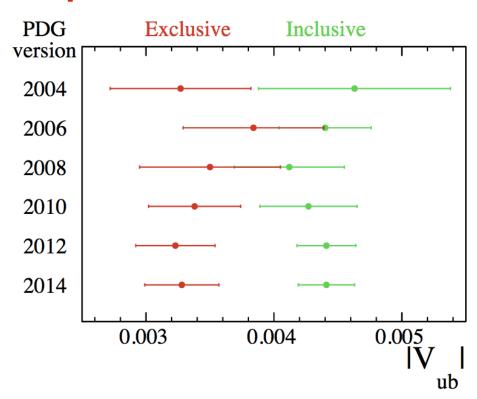

### CMS/LHCb $B_{(S)} \rightarrow \mu^+ \mu^-$

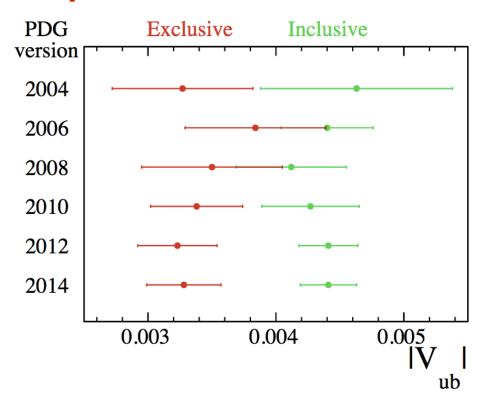

$$\frac{BR(B\rightarrow \mu^+\mu^-)}{BR(B_S\rightarrow \mu^+\mu^-)} \quad 2.3\sigma \text{ high w.r.t. SM}$$

### $V_{\text{ub}}$ puzzle

### V<sub>ub</sub> puzzle

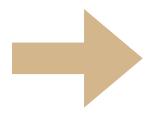

Inclusive

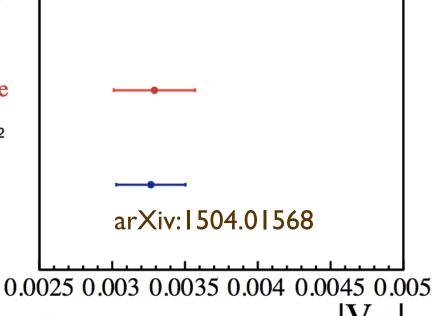

### $\Lambda_b \rightarrow p \mu \nu$ at LHCb

#### **Exclusive**

$$rac{\mathcal{B}(\Lambda_b o p \mu^- \overline{
u}_\mu)_{q^2 > 15\,\mathrm{GeV}^2/c^4}}{\mathcal{B}(\Lambda_b o \Lambda_c \mu 
u)_{q^2 > 7\,\mathrm{GeV}^2/c^4}} = (1.00 \pm 0.04(stat) \pm 0.08(syst)) imes 10^{-2}$$

LHCb

LHCb-preliminary

 $|V_{ub}| = (3.27 \pm 0.15(exp) \pm 0.17(theory) \pm 0.06(|V_{cb}|)) \times 10^{-3}$ 

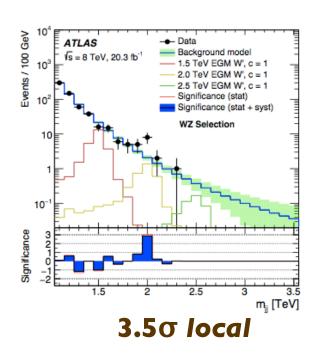

### Anomalies left over from run I, examples at large Q

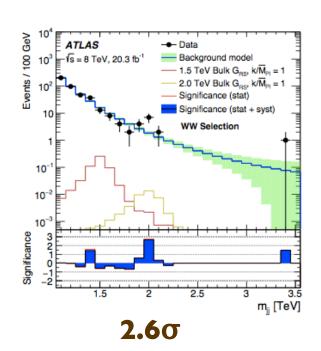

ATLAS, arXiv: 1506.00962

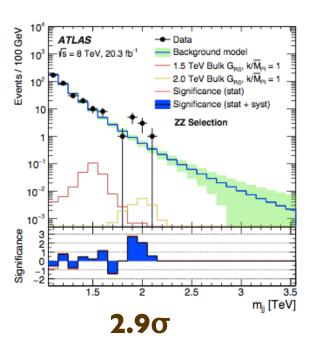

### $pp \rightarrow X \rightarrow VV' \rightarrow jet jet$ , with $V^{(\prime)}=W,Z$ fully hadronic decays

 $| m_j - m_V | < 13 \text{ GeV}$ 

 $\rightarrow$  **2.40** *global*, accounting for the whole range of  $m_{jj}$  and for ZZ, WW, WZ modes

NB: the excesses are strongly correlated:  $|m_j - m_V| < 13$  GeV allows the same event to belong to more than one selection among WZ, WW and ZZ

### Anomalies left over from run I, examples at large Q

### **Dileptons + jets + MET (SUSY searches)**

CMS, http://arxiv.org/abs/1502.06031

ATLAS, http://arxiv.org/abs/1503.03290

$$N_{\text{jets (pT}}$$
>40 GeV)  $\geq$ 2,  $E_{\text{T}}^{\text{miss}}$  > 150 GeV or

$$N_{jets}$$
 (pT>40 GeV)  $\geq$ 3,  $E_{T}^{miss} > 100 \text{ GeV}$ 

low mass: 
$$m_{\parallel} = (20-70) \text{ GeV}$$
  
On-Z:  $m_{\parallel} = (81-101) \text{ GeV}$ 

$$N_{jets (p_T>35 \text{ GeV})} \ge 2$$
,  $E_T^{miss} > 225 \text{ GeV}$   
 $H_T > 600 \text{ GeV}$ 

On-Z: 
$$m_{\parallel} = (81-101) \text{ GeV}$$

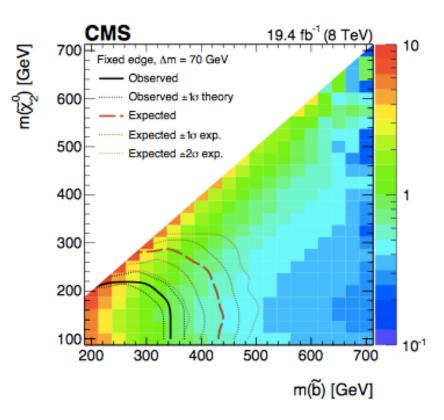

### CMS, http://arxiv.org/abs/1502.06031

	Low-mass		On-Z	
	Central	Forward	Central	Forward
Observed	860	163	487	170
Flavor-symmetric	$722 \pm 27 \pm 29$	$155\pm13\pm10$	$355\pm19\pm14$	$131\pm12\pm8$

$Z/\gamma^*$ + jets (jet-smearing)	$0.05 \pm 0.04$	0.02	-0.03		$0.07 \pm 0.05$
Rare top	$0.18 \pm 0.06$	$0.17 \pm 0$			$0.35 \pm 0.12$
WZ/ZZ diboson	$1.2 \pm 0.5$	1.7 ±	0.6		$2.9 \pm 1.0$
Fake leptons	$0.1^{+0.7}_{-0.1}$	1.2	+1.3 -1.2		$1.3^{+1.7}_{-1.3}$

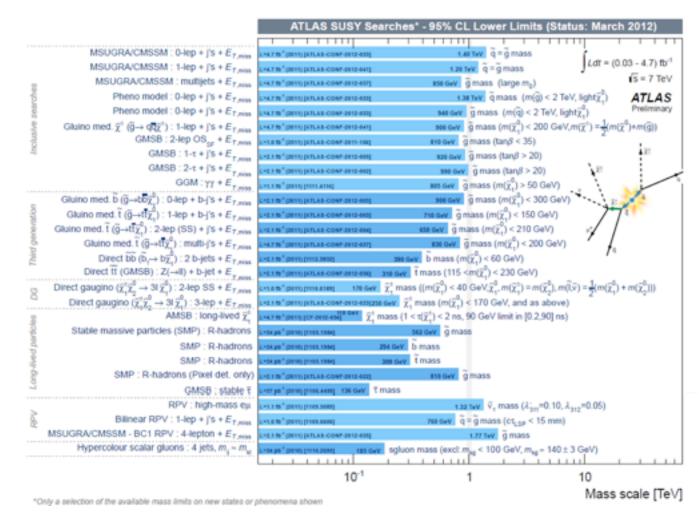

... but no signal off-peak

 $\sigma(800 \text{ GeV}) \text{ ratio } 13\text{TeV}/8\text{TeV} \sim 8.5$ 

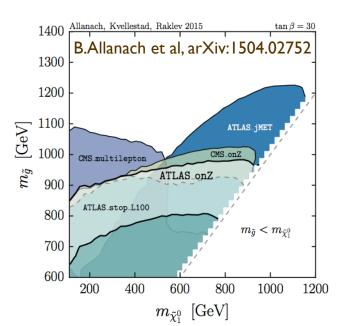

#### a remark ....

Assessing the consistency/significance of such anomalies in view of the multitude and diversity of existing constraints, is becoming more and more difficult!

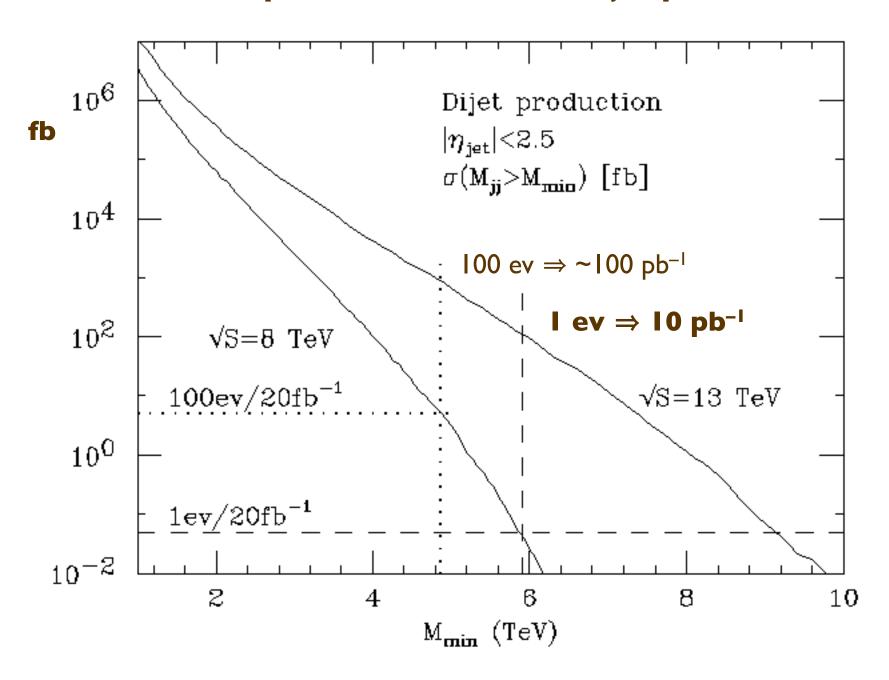

⇒ relevance of "recasting" frameworks and tools,

"simplified models" approaches, proper documentation and archival of exptl results, ....

# How long before run 2 extends the discovery reach of run 1?

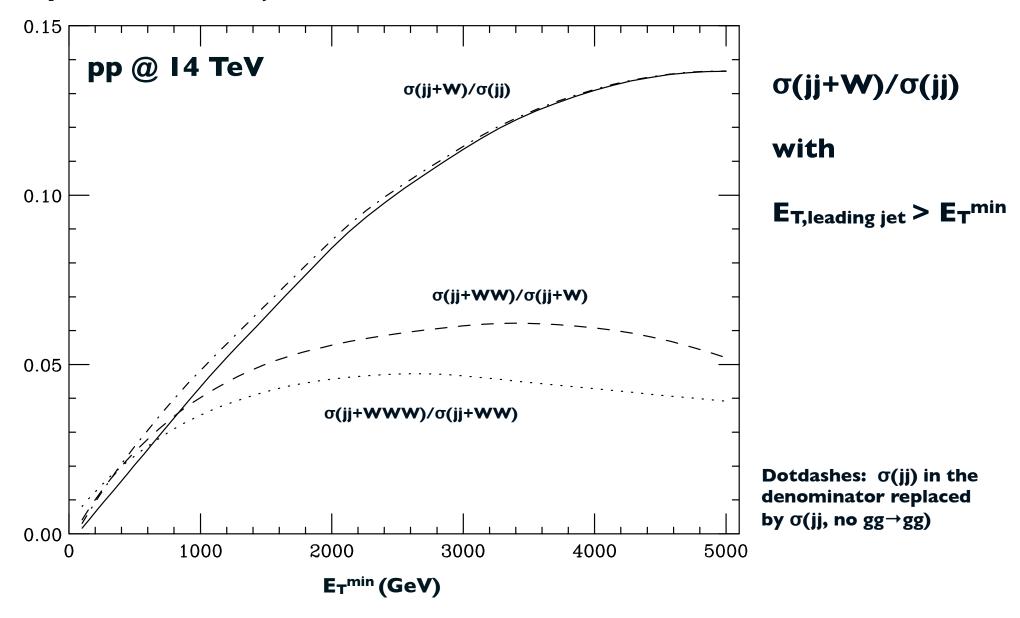

#### Rate comparison 8 vs 13 TeV: dijet production

#### Remarks

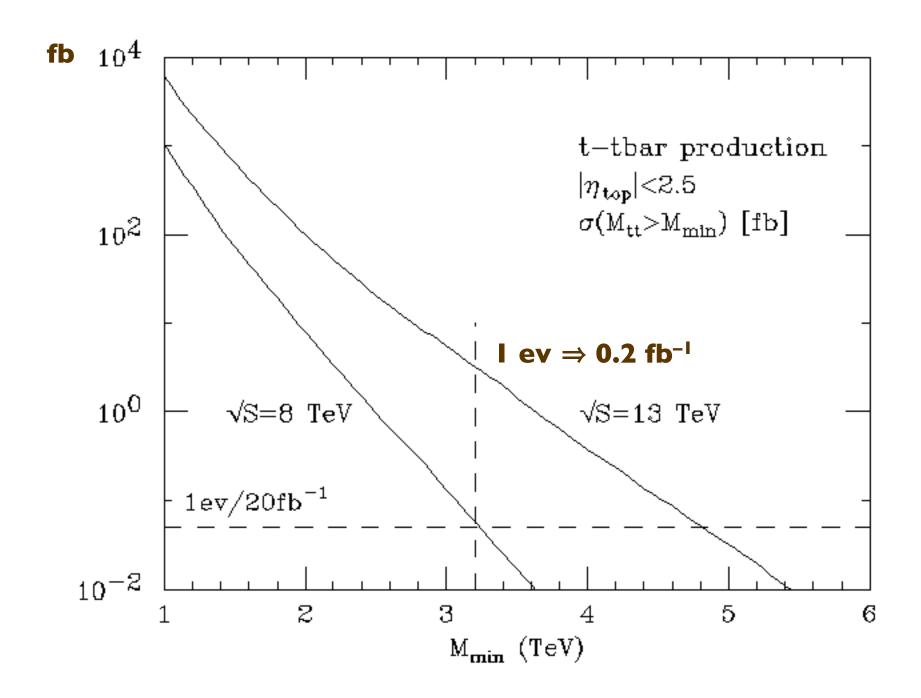

- Large statistics of jets with E<sub>T</sub> in the multi-TeV range =>
  - start measurements of large EW effects

#### W production in dijet events

- Substantial increase of W production at large energy: over 10% of high-ET events have a W or Z in them!
- It would be interesting to go after these W and Zs, and verify their emission properties

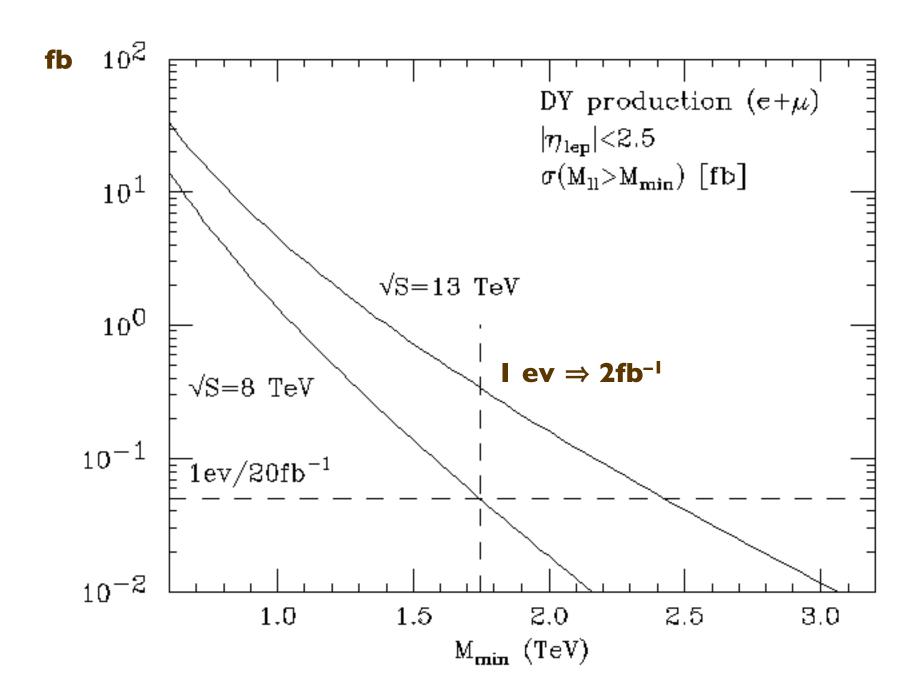

#### Rate comparison 8 vs 13 TeV: t tbar production

#### Remarks

- After ~20 fb⁻¹ top quark E<sub>T</sub> probed above 2-3 TeV =>
  - Lorentz factor γ larger than 10:
    - top jet ~ b jet at LEP!
  - all top decay products within a cone with R<0.1</li>
    - "hyper"-boosted regime for top tagging ...

#### Rate comparison 8 vs 13 TeV: Drell-Yan production

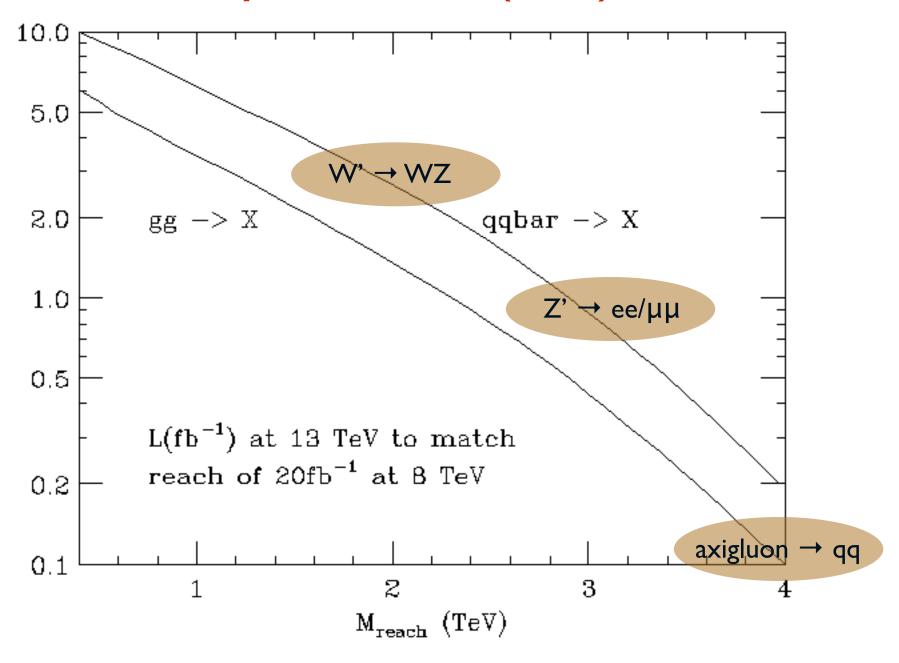

The more strongly coupled is a process,

- The more strongly coupled is a process,
  - the larger is the mass scale that was explored/constrained during Run I,

- The more strongly coupled is a process,
  - the larger is the mass scale that was explored/constrained during Run I,
    - $\rightarrow$  the larger is the cross section gain from  $8 \rightarrow 13$  TeV,

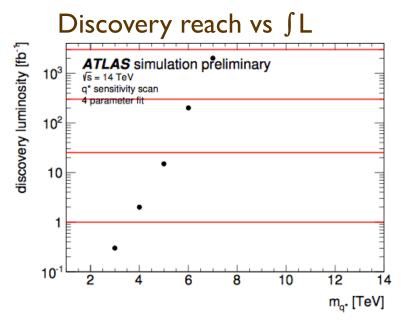

- The more strongly coupled is a process,
  - the larger is the mass scale that was explored/constrained during Run I,
    - $\rightarrow$  the larger is the cross section gain from  $8 \rightarrow 13$  TeV,
      - the sooner Run 2 will catch up and extend the search potential

# 13 TeV luminosity required to match BSM sensitivity reached so far (20fb<sup>-1</sup>) at 8 TeV

#### ATLAS/CMS projections for early discovery in run 2: dijet resonances

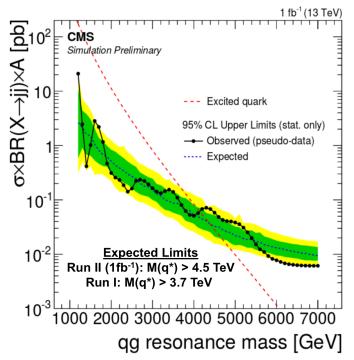

ATL-PHYS-PUB-2015-004

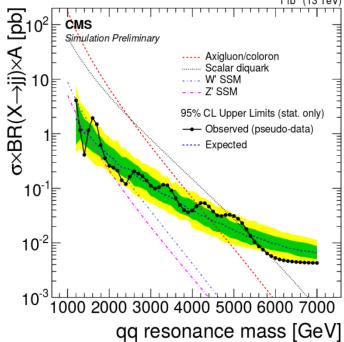

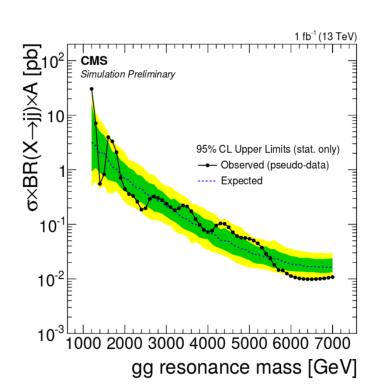

#### Exclusion reach vs ∫L

integrated luminosity [fb <sup>-1</sup> ]	m <sub>q*</sub> [TeV]
0.1	4.0
1	5.0
5	5.9
25	6.6
300	7.4
3000	8.0

#### CMS, PHYS 14 exercise

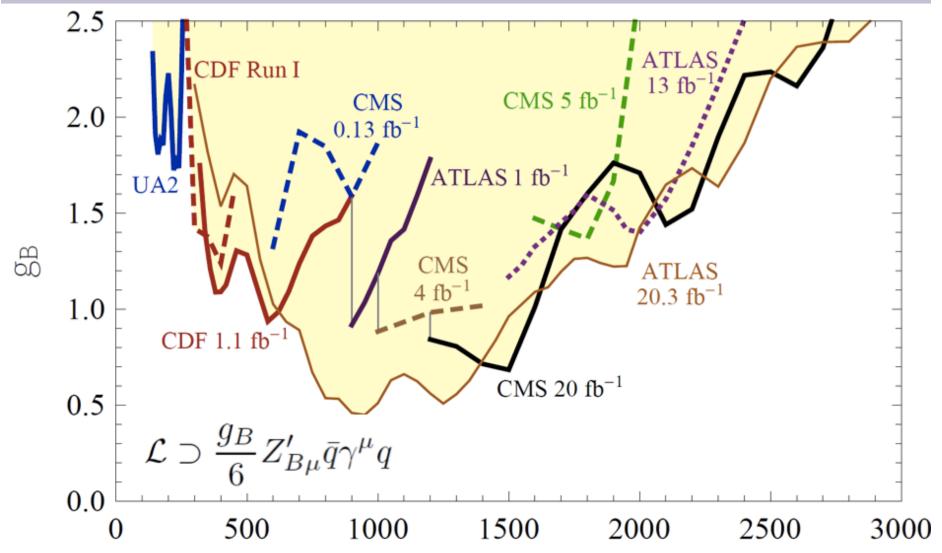

#### Remarks

- Large statistics of jets with E<sub>T</sub> in the multi-TeV range =>
  - start measurements of large EW effects
- Further studies at high energy/luminosity should not just focus on pushing the high mass end, but also on exploring low-couplings at low mass

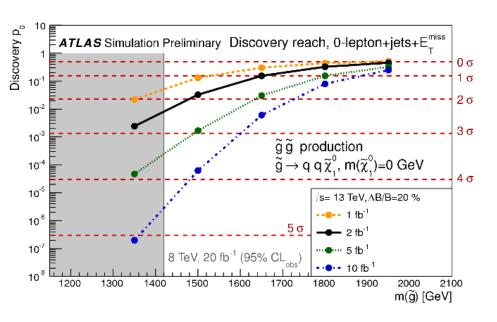

# Current g<sub>B</sub> vs. M<sub>Z</sub>, limits: Z'<sub>B</sub> dijet resonance

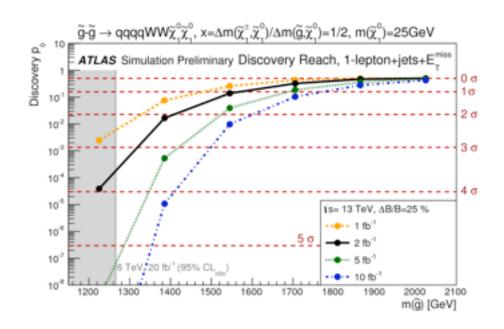

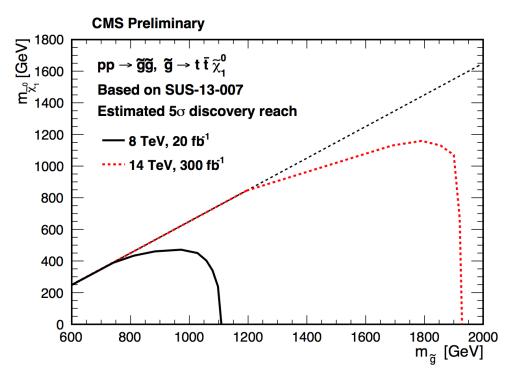

B. Dobrescu, F. Yu arXiv:1306.2629, updated (F.Yu) with new ATLAS arXiv:1407.1376 results

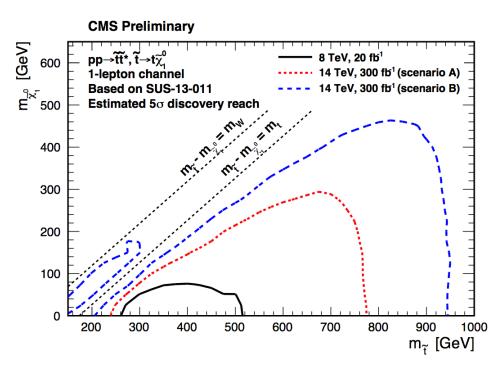

#### ATLAS/CMS projections for discovery in run 2: SUSY

SUSY: ATL-PHYS-PUB-2015-005

#### **Observation**

• For what concerns the extension of the discovery reach at high mass, nothing in the future of the LHC programme will match the step forward from 20 fb<sup>-1</sup> at 8 TeV to 100 fb<sup>-1</sup> at 13 TeV

## Higgs rates, 8 vs 13 TeV

	σ(8 TeV)	σ(13 TeV)	ratio
gg→H	19.3	43.9	2.3
VBF	1.58	3.75	2.4
WH	0.70	1.38	2.0
ZH	0.42	0.87	2.1
ttH	0.13	0.51	3.9

From Higgs Cross Section WG, @m<sub>H</sub> = 125 GeV

⇒ run 2 statistics ~10-20 times larger than run l

## run I H statistics in perspective

Most recent updates of Higgs results at CERN PH LHC seminars:

ATLAS H studies: P. Onyisi, http://indico.cern.ch/event/360241/ CMS H studies: P. Musella, http://indico.cern.ch/event/360238/ ATLAS/CMS m<sub>H</sub>: N.Wardle, http://indico.cern.ch/event/360243/

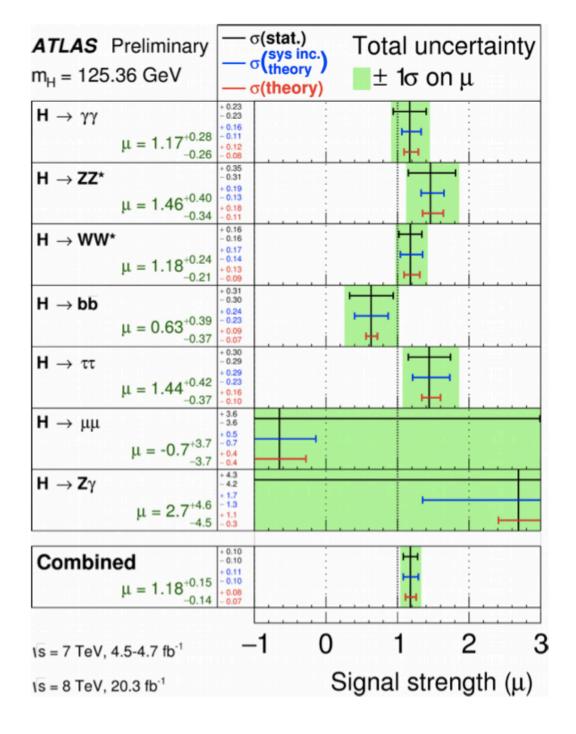

#### Mass:

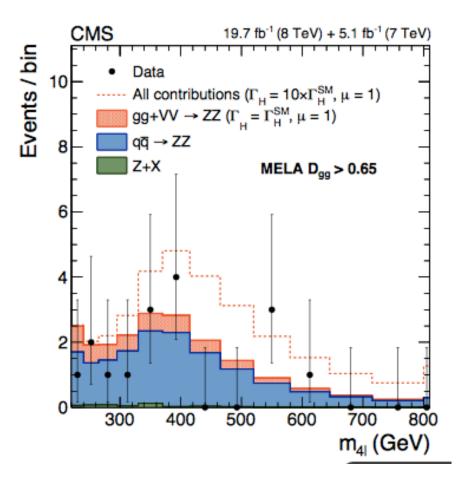

$$m_H = 125.09 \pm 0.21(stat) \pm 0.11(syst) GeV$$

**Rate** (
$$\mu$$
=data/SM for  $\sigma \cdot BR$ ):

$$\mu_{ATLAS} = 1.18 \pm 0.10(stat) \pm 0.07(expt) \pm 0.08(theory)$$

$$\mu_{CMS} = 1.00 \pm 0.09(stat) \pm 0.07(expt) \pm 0.08(theory)$$

# H@run2inperspective

# H@run2inperspective

- Run I → Run 2 will mark the transition from statisticslimited to systematics-dominated Higgs physics
  - of course not in all channels ..... for ttH production and H→bb decays the goal is still confirmation of the signal

# H@run 2 in perspective

- Run I → Run 2 will mark the transition from statisticslimited to systematics-dominated Higgs physics
  - of course not in all channels ..... for ttH production and H→bb decays the goal is still confirmation of the signal
- Higher stat will allow
  - more thorough studies of systematics, particularly theoretical modeling of signals and backgrounds in fiducial regions
  - to fragment studies into more signal regions, with complementary systematics and sensitivity to signal properties

# H@run2inperspective

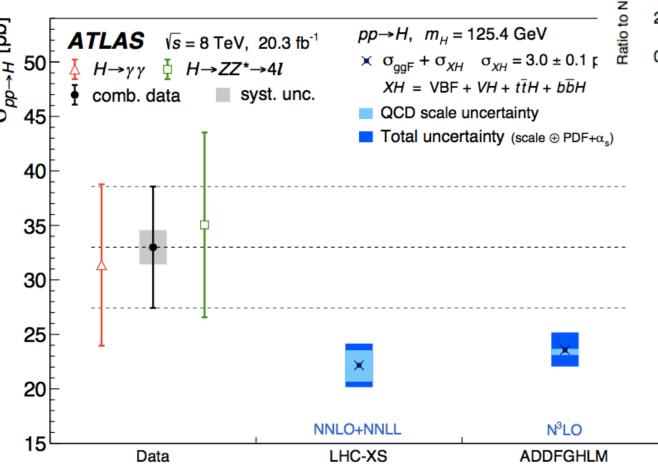

- Run I → Run 2 will mark the transition from statisticslimited to systematics-dominated Higgs physics
  - of course not in all channels ..... for ttH production and H→bb decays the goal is still confirmation of the signal
- Higher stat will allow
  - more thorough studies of systematics, particularly theoretical modeling of signals and backgrounds in fiducial regions
  - to fragment studies into more signal regions, with complementary systematics and sensitivity to signal properties
- Run 2 will prepare the ground for the work needed to fully exploit the ultimate HL-LHC luminosity in terms of Higgs physics, and will give us a much more clear picture of what the ultimate precision targets can be

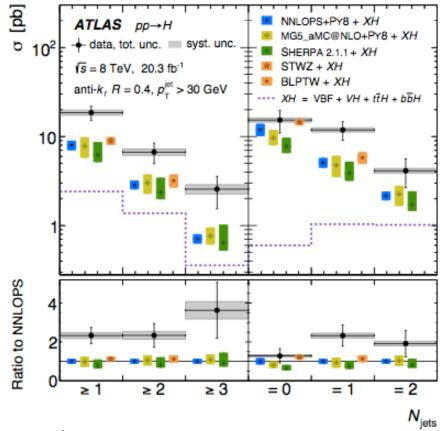

#### **Example:**

ATLAS, arXiv:1504.05833

#### Total and Differential Higgs Cross Sections from H → γγ and H →ZZ\* →4I

$$\sigma(pp \to H) = 33.0 \pm 5.3(stat) \pm 1.6(syst) pb$$
  
= 33.0 ± 5.5(tot run 1) pb

NB Most of the TH vs data discrepancy comes from final states with jets, which in other analyses (WW\*) are left out ....

#### **Example:**

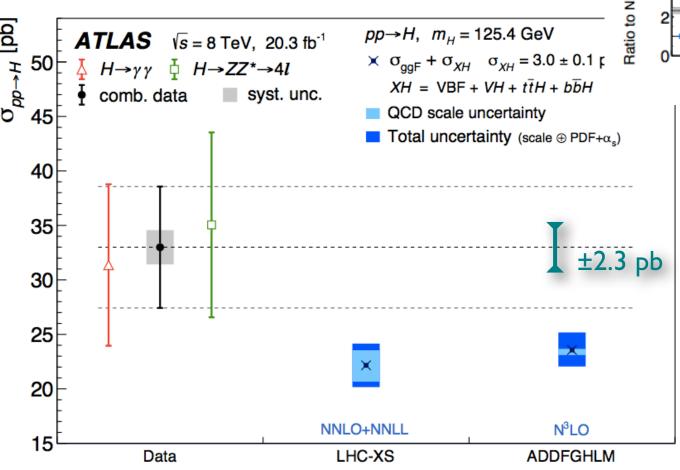

ATLAS, arXiv:1504.05833

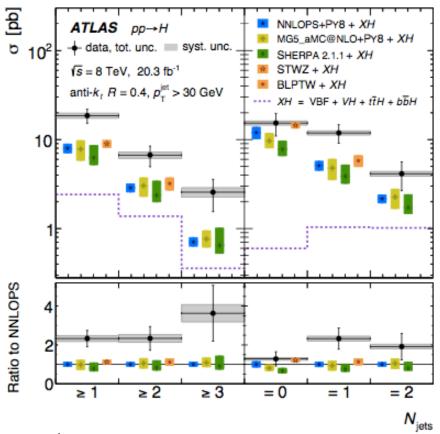

# Total and Differential Higgs Cross Sections from $H \rightarrow \gamma \gamma$ and $H \rightarrow ZZ^* \rightarrow 4I$

$$\sigma(pp \to H) = 33.0 \pm 5.3(stat) \pm 1.6(syst) pb$$
  
= 33.0 ± 5.5(tot run I) pb

 $\times$  10 statistics  $\Rightarrow$ 

$$\sigma(pp \rightarrow H) = XX \pm 2.3 pb$$

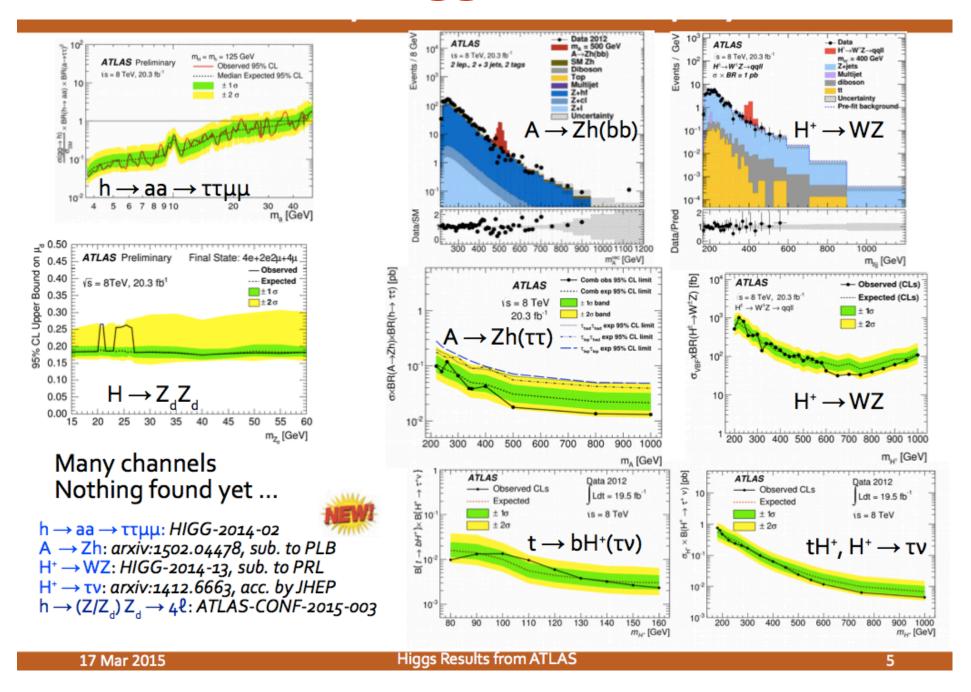

NB Most of the TH vs data discrepancy comes from final states with jets, which in other analyses (WW\*) are left out ....

# **BSM** Higgs searches

 The LHC has an incredibly robust and compelling physics programme for many years to come

- The LHC has an incredibly robust and compelling physics programme for many years to come
- Its discovery potential covers most directions of interest, from the high mass frontier, to flavour, to Higgs properties, to measurements of SM parameters and dynamics ( $m_{top}$ ,  $m_W$ ,  $sin^2\theta_W$ , PDFs, spectroscopy, .....)

- The LHC has an incredibly robust and compelling physics programme for many years to come
- Its discovery potential covers most directions of interest, from the high mass frontier, to flavour, to Higgs properties, to measurements of SM parameters and dynamics ( $m_{top}$ ,  $m_W$ ,  $sin^2\theta_W$ , PDFs, spectroscopy, .....)
- The gain in discovery reach at high mass, between 20 fb<sup>-1</sup> at 8 TeV and 100 fb<sup>-1</sup> at 13 TeV, will likely have no equal for a long time to come

- The LHC has an incredibly robust and compelling physics programme for many years to come
- Its discovery potential covers most directions of interest, from the high mass frontier, to flavour, to Higgs properties, to measurements of SM parameters and dynamics ( $m_{top}$ ,  $m_W$ ,  $sin^2\theta_W$ , PDFs, spectroscopy, .....)
- The gain in discovery reach at high mass, between 20 fb<sup>-1</sup> at 8 TeV and 100 fb<sup>-1</sup> at 13 TeV, will likely have no equal for a long time to come
- In run 2 Higgs physics will step into the precision era. The success of this programme will benefit from through campaigns of bread and butter measurements of SM dynamics, needed to develop, improve and validate the theoretical tools required to push the precision and reliability of the interpretation of experimental data.
