

**Rencontres de Blois
May 2016**

Progress in Precision Calculations

**Barbara Jäger
University of Tübingen**

“precision” – definition:

- 1 the quality or state of being **precise** : EXACTNESS
- 2 a: the degree of **refinement** with which an operation is performed or a measurement stated
b: the **accuracy** (as in binary or decimal places) with which a number can be represented usually expressed in terms of the number of computer words available for representation <double precision arithmetic permits the representation of an expression by two computer words>
- 3 **RELEVANCE**

[Merriam-Webster's dictionary]

progress in precision calculations ... for the LHC

this talk:

focus on **recent precision calculations** which I consider **representative** for on-going progress on the theory side and **relevant for the LHC physics program**

☞ **apologies for incompleteness**

anatomy of an LHC event

today:

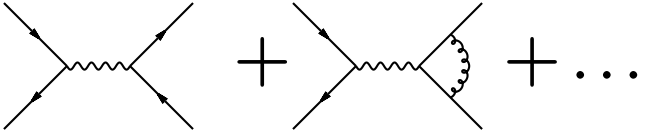

focus on high-energy
perturbative scattering
process

not covered:

- underlying event
- PDFs
- hadronization

hard scattering: the perturbative approach

high energies: (ideally) series expansion in α_s (or α)

$$\sigma = \sum_{n=n_0}^N \alpha_s^n \sigma^{(n)} + \mathcal{O}(\alpha_s^{N+1})$$

The diagram shows two Feynman diagrams representing scattering processes. The first diagram is a tree-level process with two incoming lines on the left and two outgoing lines on the right, connected by a wavy line. The second diagram is a one-loop process with two incoming lines on the left and two outgoing lines on the right, connected by a wavy line and a loop. The diagrams are separated by plus signs and followed by an ellipsis.

truncation at fixed order α_s^N (\rightarrow LO, NLO, ...)

order N provided by theoretician (“# of loops”) depends on:

- ❖ complexity of the problem
 - kinematic properties of the reaction
 - multiplicity of the final state (“# of legs”)
 - mass scales of involved particles
 - ...
- ❖ accuracy which can be achieved in experiment
- ❖ computational skills of the perturbationist

perturbative corrections: types

- ❖ fixed order QCD corrections: LO, NLO, NNLO, ...
- ❖ QCD resummations:
 - with (conventional) analytical methods (LL, NLL, NNLL, ...)
 - with (non-conventional) analytical methods (SCET, ...)
 - via parton shower Monte Carlo tools
- ❖ NLO EW corrections:

generically $\mathcal{O}(\alpha) \sim \mathcal{O}(\alpha_s^2)$, but systematic enhancements by

 - Sudakov logarithms $\sim \ln^n(M_W/Q)$ at high scales Q
 - kinematic effects from photon radiation off leptons
- ❖ consistent combination of various types of corrections

the leading order

several public programs on the market for
automated generation of hard scattering matrix elements at
tree level in the Standard Model:

AlpGen, CompHep, Helac, MadGraph, Sherpa, ...

extra features:

- ❖ physics beyond the Standard Model
- ❖ facilities for phase-space integration
- ❖ analysis tools
- ❖ interfaces to parton-shower generators
- ❖ ...

leading order at one loop

loop-induced processes: e.g. $gg \rightarrow HH$, $gg \rightarrow VV$, ...

loop calculators for amplitudes: MadLoop, OpenLoops

more details: talks by
Olivier Mattelaer and Benoit Hespel

QCD: the next-to-leading order

development of new techniques over last 15 years:

OPP algorithm, generalized unitarity, loops from trees, recursion relations, ...

☞ starting point of **automated approaches to loop calculations**

multi-purpose tools for
(more or less) automated
computation of NLO QCD
amplitudes

MadGraph5_aMC@NLO,
OpenLoops, GoSam, ...

dedicated tools for efficient
calculation of specific
processes

HAWK, MCFM, VBFNLO, ...

public loop integral libraries

Carazza, Ellis, Zanderighi (2007, 2016)

The image shows the header of the QCDLoop website. It features the logo "QCDLoop" in a blue, sans-serif font, where the "O" is a stylized infinity symbol. Below the logo, the text "Object-oriented one-loop scalar Feynman integrals framework" is displayed in a smaller, black font. At the bottom of the header, there are two orange buttons: "DOWNLOAD" on the left and "LIVE DEMO" on the right.

Denner, Dittmaier, Hofer (2016)

The logo for COLLIER consists of the word "COLLIER" in a bold, black, sans-serif font. The letter "O" is replaced by a stylized Feynman diagram of a one-loop scalar integral, rendered in a teal color.

**A Complex
One-Loop Library
with Extended
Regularizations**

frontiers of NLO QCD

exact NLO calculation of **multi-leg processes** possible

→ accurate treatment of **off-shell configurations**
 (narrow-width approximation no longer necessary)

example: $t\bar{t}H$ (with $t \rightarrow Wb \rightarrow \ell\nu b$)

[Beenakker et al.; Dawson et al. (2001-03)]

$pp \rightarrow e^+\nu_e\mu^-\bar{\nu}_\mu b\bar{b}H$ [Denner, Feger (2015)]

$pp \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b \bar{b} H$ at NLO QCD

Denner, Feger (2015)

tremendous complexity:

- ◆ amplitudes generated with the help of automated tool RECOLA
- ◆ loop integrals are evaluated with the COLLIER library
- ◆ bottle neck: efficient phase-space integration

gain: full control on final-state particles

(realistic cuts on leptons and b -jets, access to decay correlations, ...)

$pp \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b \bar{b} H$ at NLO QCD

Denner, Feger (2015)

dynamical scale improves perturbative stability

from $pp \rightarrow t\bar{t}j$ to $pp \rightarrow e^+ \nu_e \mu^- \bar{\nu}_\mu b\bar{b}j$

Bevilaqua et al. (2015)

full off-shell effects for $pp \rightarrow t\bar{t}j$ using the programs Helac-1Loop, OneLoop, CutTools

QCD: the next-to-next-to leading order

amazing progress in computation of total cross sections and differential distributions for benchmark processes at NNLO QCD

requiring: two-loop amplitudes for a process X , one-loop amplitudes for the processes $X + 1$ parton, tree-level amplitudes for the processes $X + 2$ partons

prerequisites:

- ✓ availability of **2-loop master integrals**
- ✓ efficient subtraction techniques for **infrared divergences**
(q_T subtraction, N-jettiness, antenna subtraction, sector decomposition, projection to Born)
- ✓ powerful **Monte-Carlo programs** of high numerical stability

$pp \rightarrow X$ beyond one loop

process	motivation
dijets	PDFs, strong coupling, BSM
H	Higgs couplings
H +jet	Higgs couplings
$t\bar{t}$	top properties, PDFs, BSM
single top	top properties, PDFs
VBF	Higgs couplings
V+jet	PDFs
VH	Higgs couplings
VV	gauge couplings, BSM
HH	Higgs potential

NNLO QCD: new public Monte Carlo programs

brand-new: implementation of several NNLO QCD processes with color-singlet final states in the [public Monte Carlo program MCFM](#)

$pp \rightarrow H, Z, W, HZ, HW, \gamma\gamma$ (including decays)

performance: very CPU efficient

(1% statistical accuracy within a few hours on 8 cores)

Boughezal et al. (05/2016)

in preparation: fully differential [NNLO process library MATRIX](#)

$pp \rightarrow Z, W, H, \gamma\gamma, ZZ, WW, WZ$ (partly including decays)

Grazzini et al. (release planned for this year)

 talk by Marius Wiesemann

$pp \rightarrow Zj$ at NNLO QCD

Boughezal et al. (2015)

2015: two completely independent calculations

[Gehrmann-De Ridder et al. & Boughezal et al.]

using different techniques

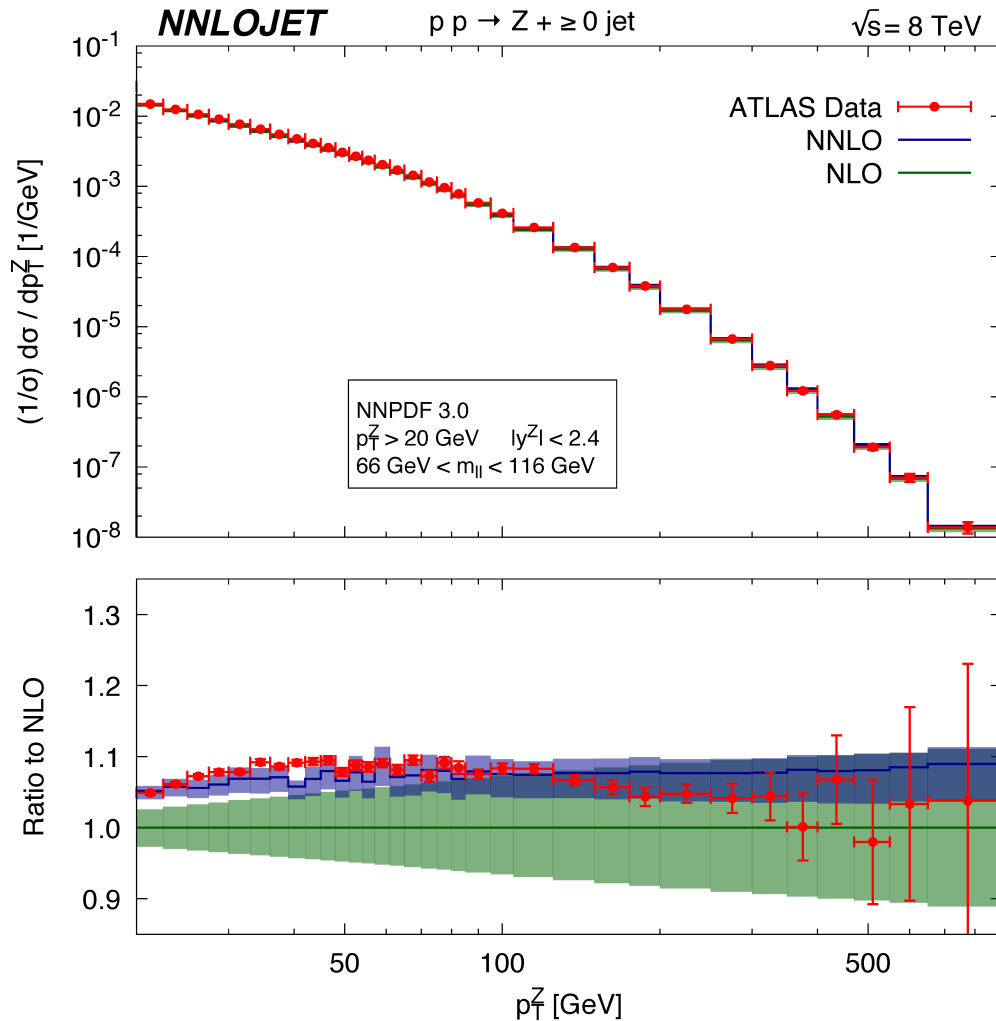

(antenna vs. N-jettiness subtraction)

- ✓ scale uncertainties reduced
- ✓ perturbative expansion stable

NNLO QCD corrections are at percent level for inclusive xsec,
up to 10% in tails of distributions

$pp \rightarrow \ell^+ \ell^- j$ at NNLO QCD

Gehrmann-De Ridder et al. (2016)

differential predictions at
NNLO accuracy soften
tension between theory and
experiment

optimal: normalize to
inclusive Drell-Yan xsec
(\rightarrow minimize impact of
experimental uncertainties)

Higgs production via vector boson fusion (VBF)

distinctive signature:

- ✓ helps for signal-to-background optimization
- ✓ clean environment for coupling measurements

❖ NLO corrections moderate and well known for long time

[Han et al. (1992), Figy et al. (2003), Berger et al. (2004), Ciccolini et al. (2007)]

❖ NNLO QCD corrections for inclusive setup:

Bolzoni et al. (2011)

- in full agreement with NLO results
- residual scale uncertainties are reduced from $\sim 4\%$ to 2%
- NNLO PDF uncertainties are at the 2% level

VBF @ NNLO: exclusive results

Cacciari, Dreyer, Karlberg, Salam, Zanderighi (2015)

	$\sigma^{(\text{no cuts})}$ [pb]	$\sigma^{(\text{VBF cuts})}$ [pb]
LO	4.032 ^{+0.057} _{-0.069}	0.957 ^{+0.066} _{-0.059}
NLO	3.929 ^{+0.024} _{-0.023}	0.876 ^{+0.008} _{-0.018}
NNLO	3.888 ^{+0.016} _{-0.012}	0.826 ^{+0.013} _{-0.014}

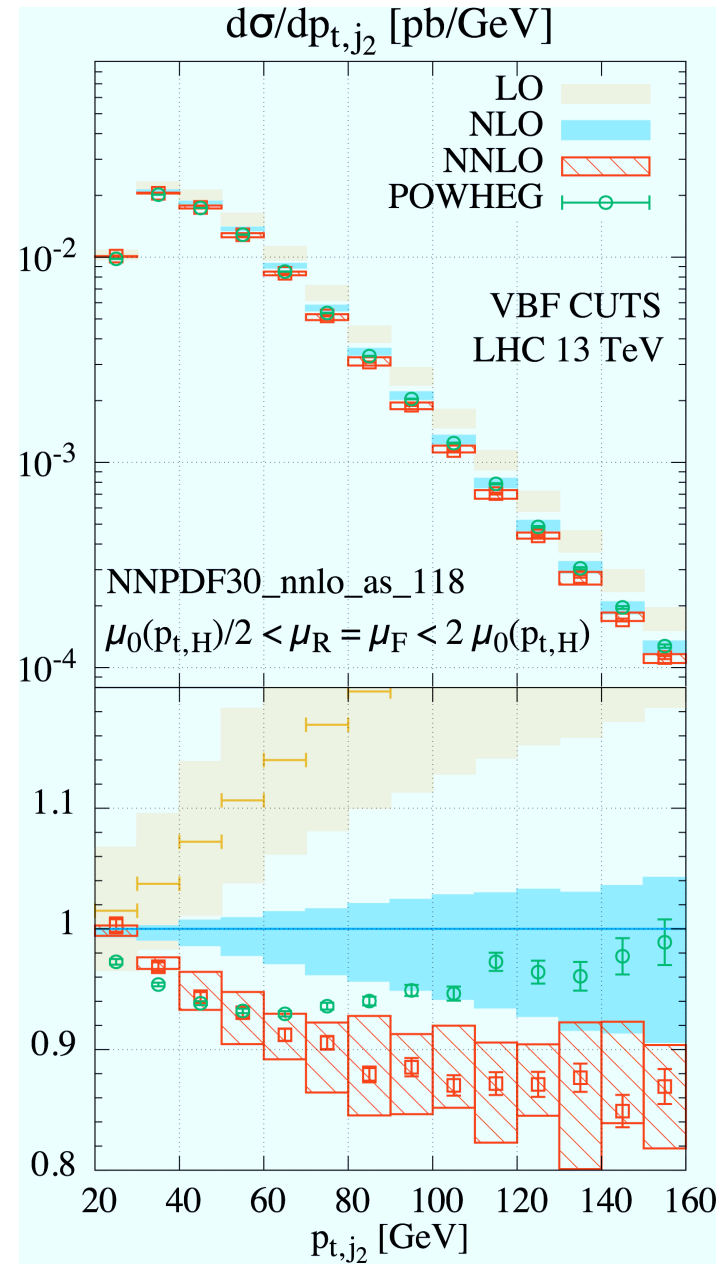

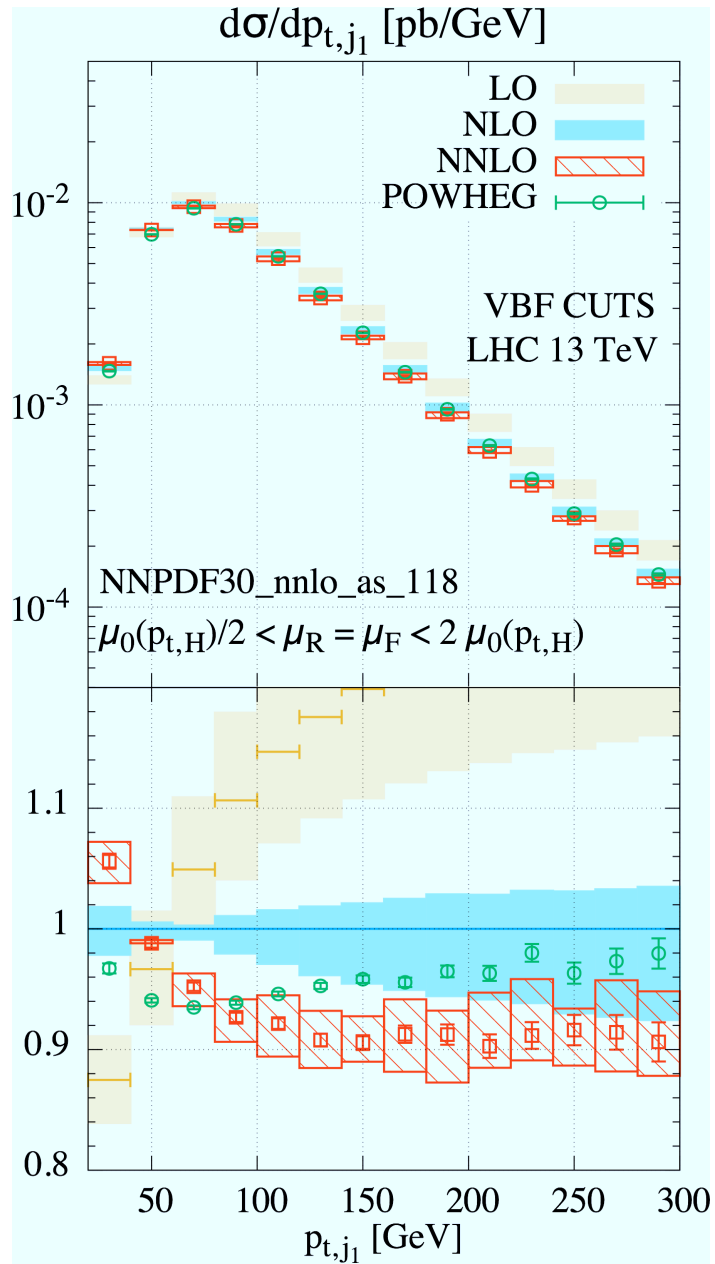

relative NNLO
corrections $\sim 1\%$

relative NNLO
corrections $\sim 6\%$

NNLO QCD corrections are much larger in
VBF setup than for inclusive cuts

VBF @ NNLO: exclusive results

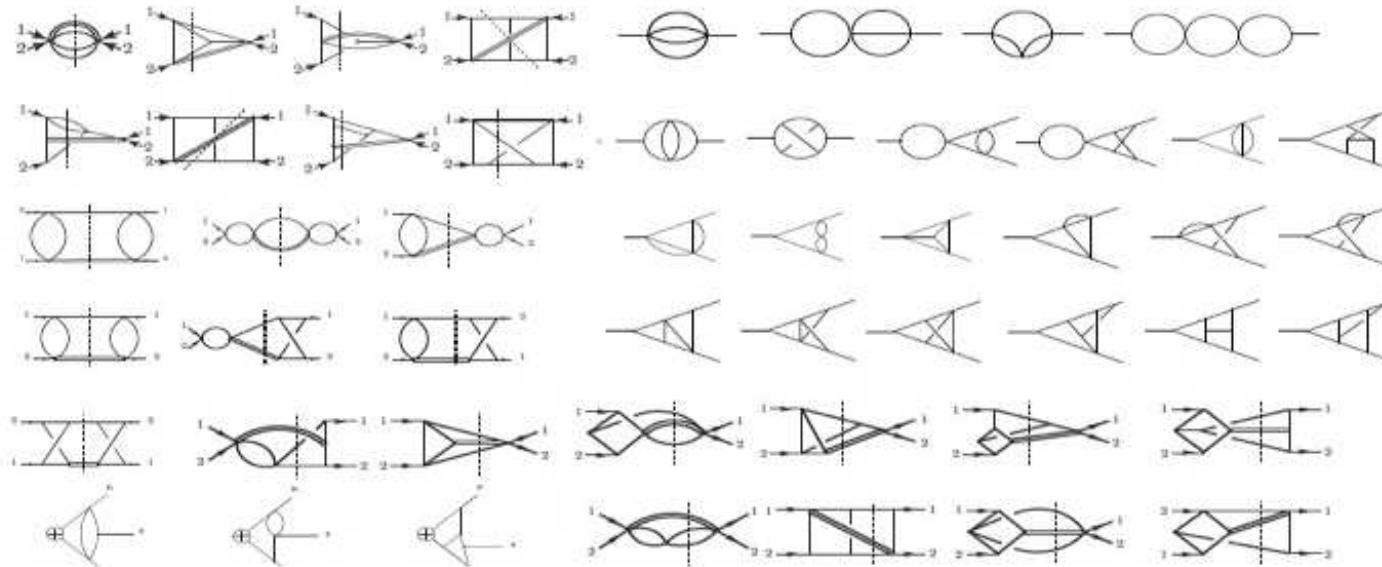

VBF @ NNLO: exclusive results

NNLO corrections
make jets softer

→ fewer events pass VBF cuts

$gg \rightarrow H$ at $N^3\text{LO}$ QCD

- ❖ only collider process known to such high orders in QCD
- ❖ outstanding complexity:
 - $\mathcal{O}(10^3)$ three-loop master integrals,
 - $\mathcal{O}(10^5)$ interference diagrams,
 - $\mathcal{O}(10^7)$ phase-space integrals
- ❖ immediate **implications on physics** at the LHC

$gg \rightarrow H$ at N³LO QCD

Anastasiou et al. (2016)

- ❖ perturbative result stabilized
- ❖ scale dependence reduced

Higgs boson pair production

- ✓ access to **self-coupling of the Higgs boson**
- ✗ loop-induced process
 - **two-loop corrections** required at NLO QCD
- ✗ technically challenging: previous calculations relied on approximations (no full top-mass dependence)

De Florian, Mazzitelli (2013); Grigo et al. (2013-15);

Maltoni et al. (2014)

Higgs boson pair production at two loops

S. Borowka et al. (04/2016)

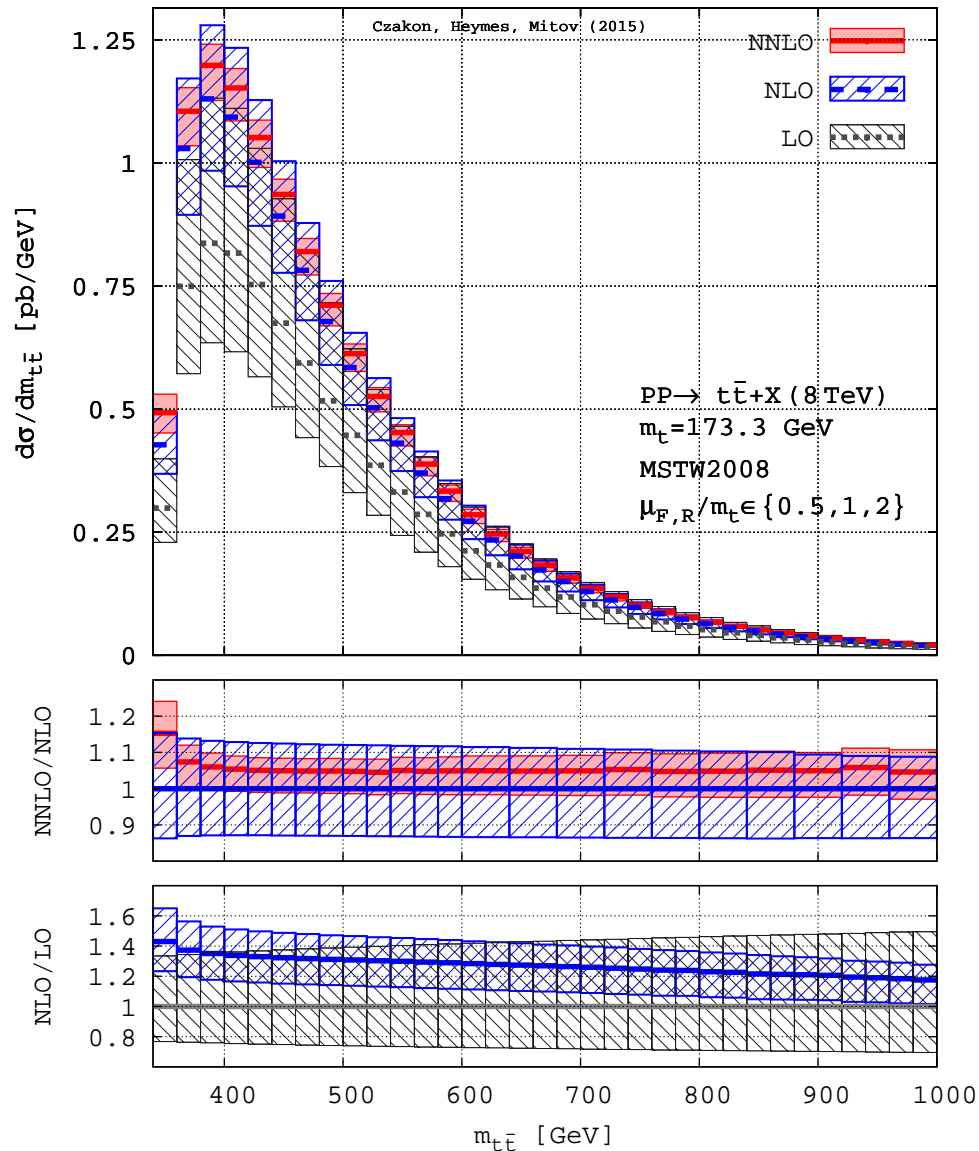

results of new
NLO calculation
cannot fully be
accounted for by
approximative
calculations

👉 more details: Sophia Borowka's talk

$pp \rightarrow t\bar{t}$: going differential at NNLO QCD

Czakon, Heymes, Mitov (2015)

- ◆ perturbative result stabilized
- ◆ scale dependence reduced
- ◆ improved agreement with data from Tevatron and LHC

future applications:

PDF fits, precision measurements of the top mass, α_s extraction

gauge-boson pair production

probe for the non-Abelian structure of the SM at high energies:

- ❖ (anomalous) **triple gauge-boson couplings**
- ❖ dynamics of **longitudinal massive gauge bosons**

constitutes important class of **background processes** to:

- ❖ the **Higgs search** in the mode $pp \rightarrow H \rightarrow VV$
- ❖ **new physics searches** with leptons+ \cancel{E}_T signatures (e.g. SUSY-particle pair production)

$pp \rightarrow WW @ \text{NNLO QCD!}$

Gehrmann et al. (08/2014)

note:
improved agreement
with LHC data

$pp \rightarrow WW$ @ NNLO QCD: going differential

Grazzini et al. (05/2016)

fully differential Monte Carlo:
allows for arbitrary cuts
and distributions/correlations of
leptonic decay products

✓ realistic predictions possible

☞ talk by Marius Wiesemann

progress in NLO EW calculations

- * NLO EW often **more demanding** than NLO QCD calculations
(richer resonance structure, more mass scales, ...)
- * most NLO EW results available based on **dedicated calculations**
($pp \rightarrow V, Vj, HV, VV, 4 \text{ leptons}, \text{dijets}, \text{VBF}, \dots$)
- * **automated tools** start to play a more important role:
Recola, OpenLoops, MadGraph5_aMC@NLO
($pp \rightarrow Vjj, 4 \text{ leptons}, t\bar{t}V, \dots$)

$pp \rightarrow WW \rightarrow 4f$: full NLO EW calculation

Biedermann et al. (05/2016)

flexible Monte-Carlo approach
gives full control on lepton
distributions and correlations with
realistic selection cuts:

EW corrections small for total XS, but
large and negative at high scales

note: based on two independent calculations
(Recola vs. dedicated standalone calculation)

$pp \rightarrow WW \rightarrow 4f$: full NLO EW calculation

Biedermann et al. (05/2016)

flexible Monte-Carlo approach
gives full control on lepton
distributions and correlations with
realistic selection cuts:

EW corrections small for total XS, but
large and negative at high scales

☞ c.f. Jochen Meyer's talk for impact
on experiment

combination of QCD and EW corrections

current experimental precision requires combination of
NLO EW corrections with best QCD prediction

how to combine?
factorized or additive approach?

$$(1 + \delta^{\text{QCD}}) \times (1 + \delta^{\text{EW}})$$

versus

$$(1 + \delta^{\text{QCD}} + \delta^{\text{EW}})$$

can only be resolved by computing
mixed QCD-EW corrections $\mathcal{O}(\delta^{\text{QCD}}\delta^{\text{EW}})$

Drell-Yan: mixed QCD \times EW corrections

Dittmaier, Huss, Schwinn (2014-16):

Factorizable contributions:

(only virtual contributions indicated)

- no significant resonance distortion expected
- no PDFs with $\mathcal{O}(\alpha\alpha_s)$ corrections

- only Vll' counterterm contributions
 \hookrightarrow uniform rescaling, no distortions

- significant resonance distortions from FSR
- calculated, preliminary results

Non-factorizable contributions:

(only virtual contributions indicated)

- could induce shape distortions
- calculated, turn out to be small

Drell-Yan: mixed QCD \times EW corrections

Dittmaier, Huss, Schwinn (2014-16):

naive factorization
QCD \times EW works

naive factorization poor for
 $p_{T,\mu} > M_W/2$

Drell-Yan: mixed QCD \times EW corrections

Dittmaier, Huss, Schwinn (2014-16):

naive factorization
QCD \times EW works

 talk by Alexander Huss

NLO QED and NLO QCD with parton showers

[Barzè et al. (2014)]

QED and QCD corrections can be combined and matched consistently with parton shower using the POWHEG framework

first implementation: $pp \rightarrow W\gamma$

NLO QCD+EW and multi-jet merging

Kallweit et al. (2015)

merged samples for
 $pp \rightarrow V + 0, 1, 2, 3 \text{ jets}$
at NLO QCD accuracy

- ✓ including virtual EW corrections
- ✗ neglecting real photon emission

making use of tools
OpenLoops & Munich/Sherpa

NNLO QCD and parton showers

first steps toward matching of NNLO QCD calculations with parton shower programs:

- ✓ **realistic** exclusive description of specific final state
 - ✓ multi-parton interactions, hadronization, underlying event
 - ✓ best possible **perturbative accuracy** of hard interaction
 - ✓ proper modeling of jets (e.g. sub-structure)
- ☞ immediate impact on LHC physics program
(Higgs, EW precision measurements, . . .)

NNLO QCD and parton showers

first steps toward matching of NNLO QCD calculations with parton shower programs:

❖ POWHEG+MINLO

$pp \rightarrow H, HW$, Drell-Yan [*Zanderighi et al. (2013-16)*]

❖ UNNLOPS

$pp \rightarrow H$, Drell-Yan [*Höche, Li, Prestel (2014)*]

❖ GENEVA

Drell-Yan [*Alioli et al. (2014)*]

NNLO QCD and parton showers

Astill et al. (2016)

- ◆ scale uncertainties reduced from about 10% to 2%
- ◆ agreement with NNLO results for inclusive lepton observables
- ◆ jet distributions sensitive to parton-shower effects
- ◆ NNLO+PS tool more flexible than pure NNLO calculation

NNLO+PS accurate description
of $pp \rightarrow HW$ using the
POWHEG+MINLO approach

recent BSM developments: NLO+PS tools

MadGraph5_aMC@NLO:

- Higgs effective field theory [*Artoisenet et al. (2013)*]
- top-quark flavor changing neutral processes [*Degrande et al. (2015)*]
- colored scalar pair production [*Degrande et al. (2015)*]
- two Higgs doublet model [*Degrande et al. (2015)*]
- dark matter production [*Backovic, Mattelaer, Neubert et al. (2015)*]
- . . .

POWHEG-BOX:

- dark matter + mono-jet production [*Haisch et al. (2013-15)*]
- slepton-pair production [*Thier et al. (2012-14)*]
- squark production and decay [*Gavin et al. (2013-14)*]
- weakino pair production [*Baglio et al. (2016)*]
- . . .

weakino pair production at NLO+PS accuracy

[Baglio et al. (2016)]

fully differential predictions for production+decay

👉 NLO corrections sizable

summary

- ❖ presented personal selection of recent results to illustrate **ongoing progress** in precision calculations
(apologies for what I could not show here)
- ❖ to achieve precision required by experiment:
 - consider (N)NLO QCD and NLO EW corrections
 - disregard approximations (infinite top mass, narrow width, ...)
 - match precision calculations to parton-shower programs
 - merge samples of different jet multiplicities
- ❖ open issue: systematic quantification of Monte-Carlo uncertainties
(dependence on matching scheme, merging scale, parton shower algorithm, ...)
- ❖ status of theory predictions advanced, several public **tools available**

Thank
You.
