We are in $m=1$ Amplituhedron!

e.g. $m=2$ $\{ \langle Y12 \rangle, \dots, \langle Y1n \rangle \}$

Amplituhedron Code

* L $(k+2)$ planes $(YAB)_i$ intersecting on k -plane Y

* $\{ \langle Y_{1234} \rangle, \dots, \langle Y_{123n} \rangle \}$ has k sign flips

* $\{ \langle Y_{AB_i 12} \rangle, \dots, \langle Y_{AB_i 1n} \rangle \}$ has $(k+2)$ sign flips

* Scattering form fixed by log singularities on \mathcal{D}

Example: 1-loop MHV

* $\{\langle AB|2\rangle, \dots, \langle AB|n\rangle\}$ has $k+2 = 2$ sign flips

$$\left\{ \begin{array}{cccc} & i & i+1 & j & j+1 \\ + & + & \dots & + & - & \dots & - & + & \dots & + \end{array} \right\}$$

$$A = z_i + \alpha_i z_{i+1} + \alpha_{i+1} z_{i+1} \quad \alpha_{i, i+1, j, j+1} > 0$$

$$B = -z_i + \alpha_j z_j + \alpha_{j+1} z_{j+1}$$

$$\Rightarrow \Omega = \sum_{i, j} d \log \alpha_i d \log \alpha_{i+1} d \log \alpha_j d \log \alpha_{j+1}$$

$$= \sum_{i, j} d \log \frac{\langle AB|i\rangle}{\langle AB|i+1\rangle} d \log \frac{\langle AB|i+1\rangle}{\langle AB|i+1\rangle} d \log \frac{\langle AB|j\rangle}{\langle AB|j+1\rangle} d \log \frac{\langle AB|j+1\rangle}{\langle AB|j+1\rangle}$$

At least for planar $\mathcal{N}=4$ SYM,
we have a concrete example where
we see locality + unitarity as
derived notions, joined at the hip,
arising from ultimately algebraic-geometric
- combinatorial origins, counting +'s and -'s.

this for Cosmological Correlators
