## New measurements of neutrino-nucleus interactions in T2K

*Thursday, 6 July 2017 12:30 (15 minutes)*

The T2K long-baseline neutrino experiment has new neutrino cross-section measurements. In addition to being interesting in their own right, measuring neutrino cross sections is vital as they correspond to a major systematic uncertainty for neutrino oscillation analyses. In particular, the new results focus on exploiting the water targets

in the T2K off-axis near detector, ND280, updating our charged-current measurements with a wider phase space, addressing in more detail the neutrino interaction vertex, and other new measurements. This talk will give an overview of the T2K neutrino cross-section measurements, focusing on the latest results.
