What cosmology can tell us about neutrinos

Friday, July 7, 2017 2:30 PM (30 minutes)

Neutrinos deeply affect cosmological observables, both in the early Universe and at low redshift. Thanks to these fingerprints, cosmology can constrain neutrino properties such as the absolute neutrino mass scale.

In this talk I will review the up to date cosmological constraints on neutrino physics; I will also show how future galaxy surveys can potentially pin down the neutrino mass sum.
