

Jet measurements in heavy ion collisions with the ATLAS detector

Martin Spousta
on behalf of the ATLAS Collaboration

Charles University,
Prague

The European Physical Society Conference on High Energy Physics
July 5-12, 2017, Venice, Italy

Introduction

- Jet production and properties are modified in heavy ion collisions
- Study of **jets in Pb+Pb** collisions should tell us about e.g.:
 - properties of de-confined matter created in heavy ion collisions
 - radiation of energetic color charges in this de-confined medium
- Study of **jets in p+Pb** collisions should tell us about e.g.:
 - initial state effects
 - correlations between soft and hard processes
- LHC **heavy ion runs** & ATLAS:
 - Run 1: Pb+Pb: $\sqrt{s_{NN}} = 2.76 \text{ TeV}$, $L_{int} = 0.15 \text{ nb}^{-1}$
 pp : $\sqrt{s} = 2.76 \text{ TeV}$, $L_{int} = 4.2 \text{ pb}^{-1}$
 p +Pb: $\sqrt{s_{NN}} = 5.02 \text{ TeV}$, $L_{int} = 29 \text{ nb}^{-1}$
 - Run 2: Pb+Pb: $\sqrt{s_{NN}} = 5.02 \text{ TeV}$, $L_{int} = 0.5 \text{ nb}^{-1}$
 pp : $\sqrt{s} = 5.02 \text{ TeV}$, $L_{int} = 28 \text{ nb}^{-1}$

Inclusive jet suppression in Pb+Pb collisions

$$R_{AA} = \frac{\frac{1}{N_{\text{evnt}}} \frac{d^2 N_{\text{jet}}^{PbPb}}{dp_T dy} \Big|_{\text{cent}}}{\langle T_{AA} \rangle_{\text{cent}} \times \frac{d^2 \sigma_{\text{jet}}^{pp}}{dp_T dy}}$$

Jet yield in heavy ion collisions

Nuclear thickness function

Jet cross-section in pp collisions

Number of expected jets per event of a given centrality

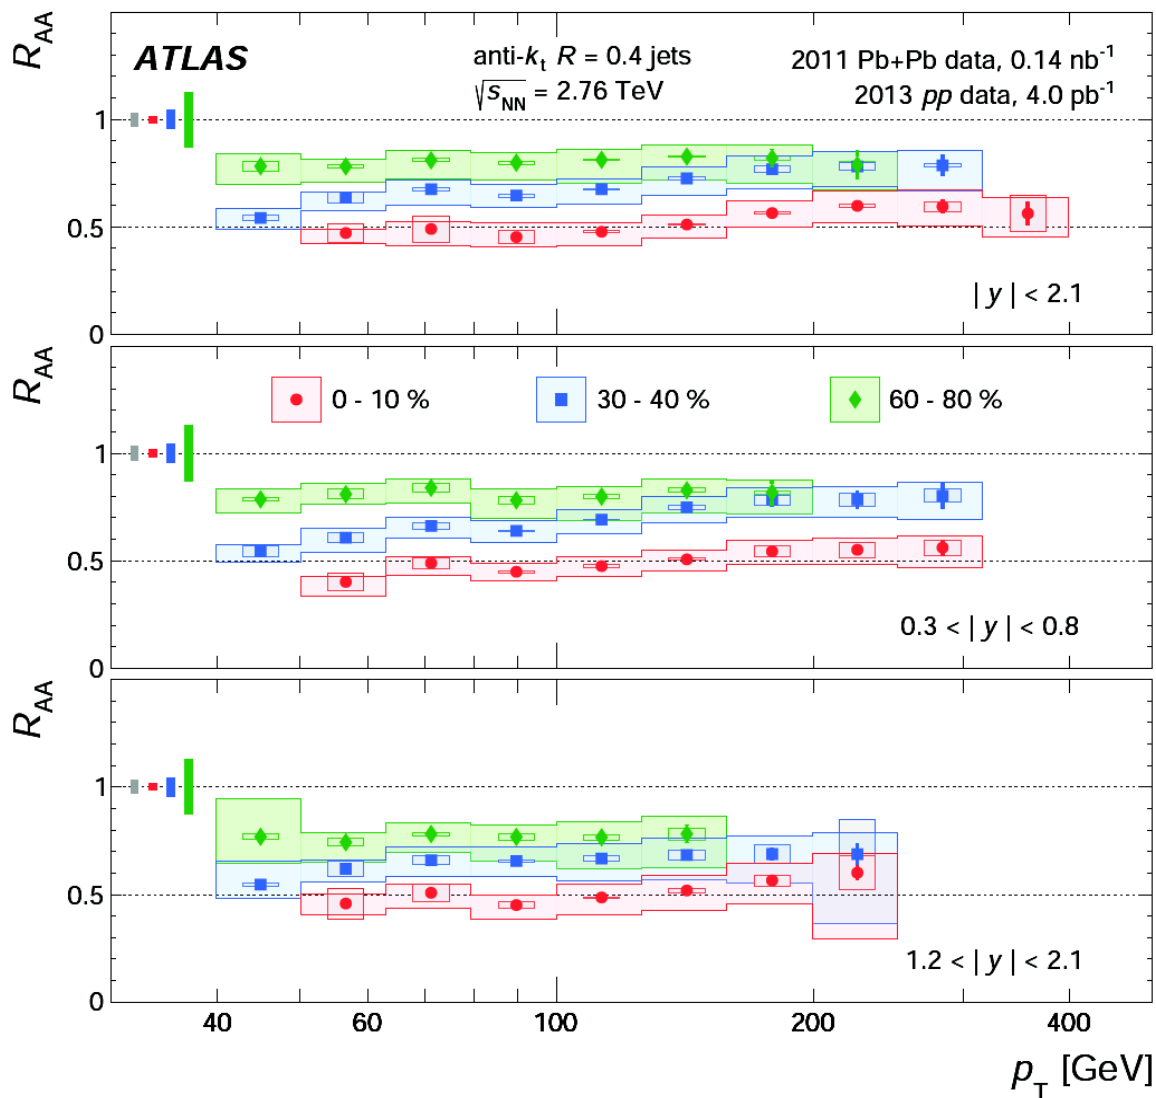

Nuclear modification factor quantifies the magnitude of the jet suppression which is dominantly due to final state interactions with constituents of the medium

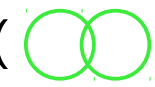

Jet R_{AA} : p_T -dependence, $\sqrt{s_{NN}} = 2.76$ TeV

PRL 114 (2015) 072302

$$R_{AA} = \frac{\frac{1}{N_{\text{evnt}}} \frac{d^2 N_{\text{jet}}^{PbPb}}{dp_T dy} \Big|_{\text{cent}}}{\langle T_{AA} \rangle_{\text{cent}} \times \frac{d^2 \sigma_{\text{jet}}^{pp}}{dp_T dy}}$$

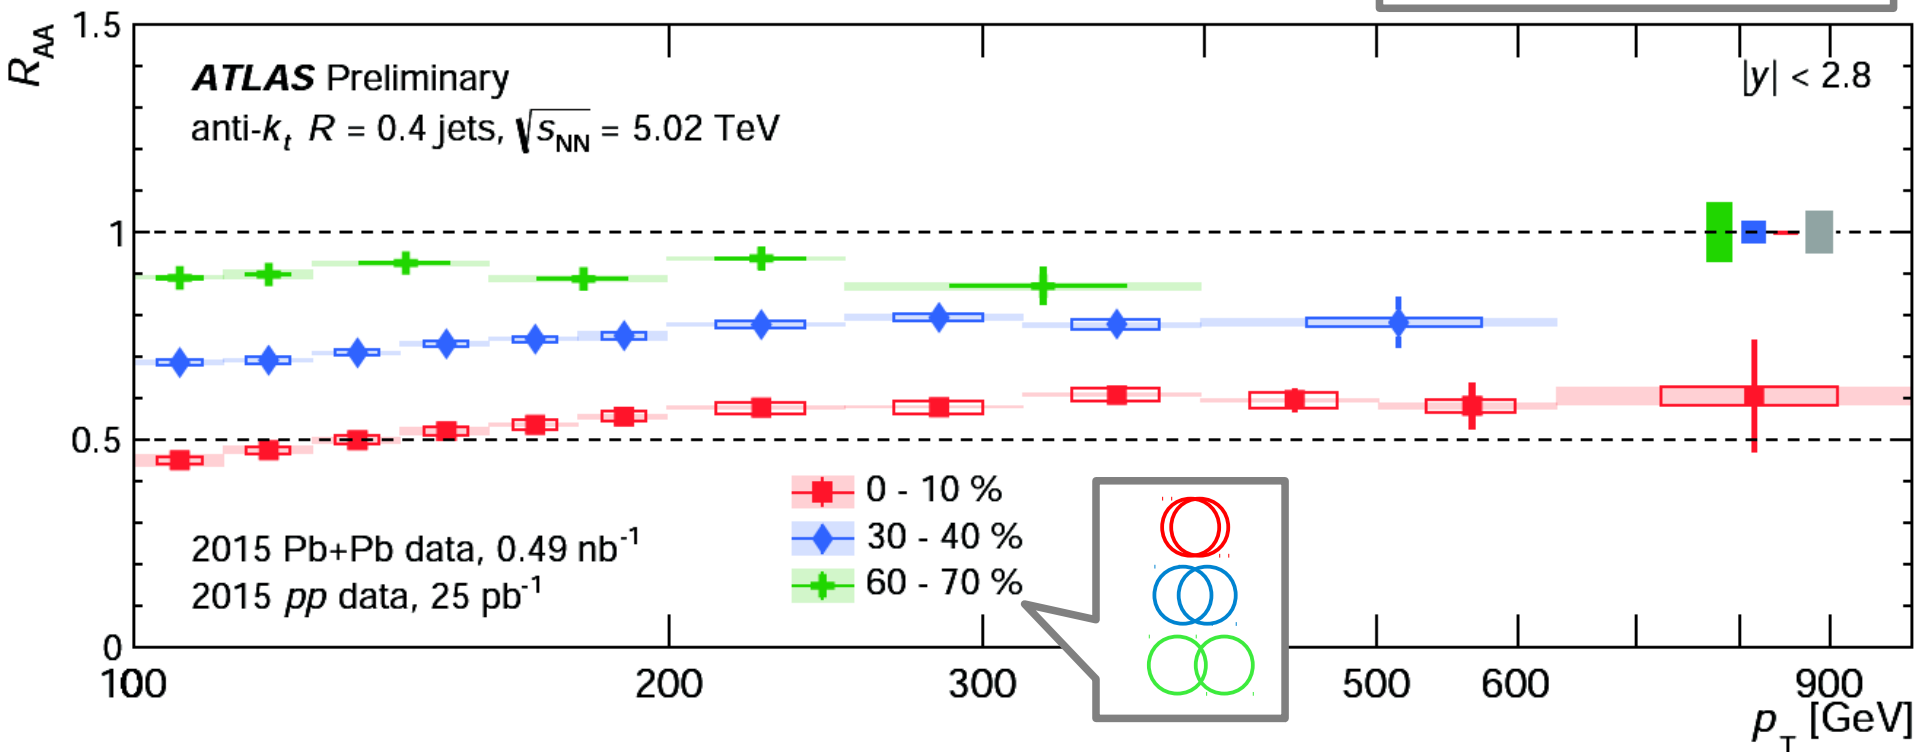

- A **factor of two** suppression of jet yield in 0-10% central collisions ().
- A **modest grow** of jet R_{AA} with increasing jet p_T .
- Still significant **suppression even for 60-80% centrality** bin ().
- **Practically no rapidity dependence.**

Jet R_{AA} : p_T -dependence, $\sqrt{s_{NN}} = 5.02$ TeV

ATLAS-CONF-2017-009

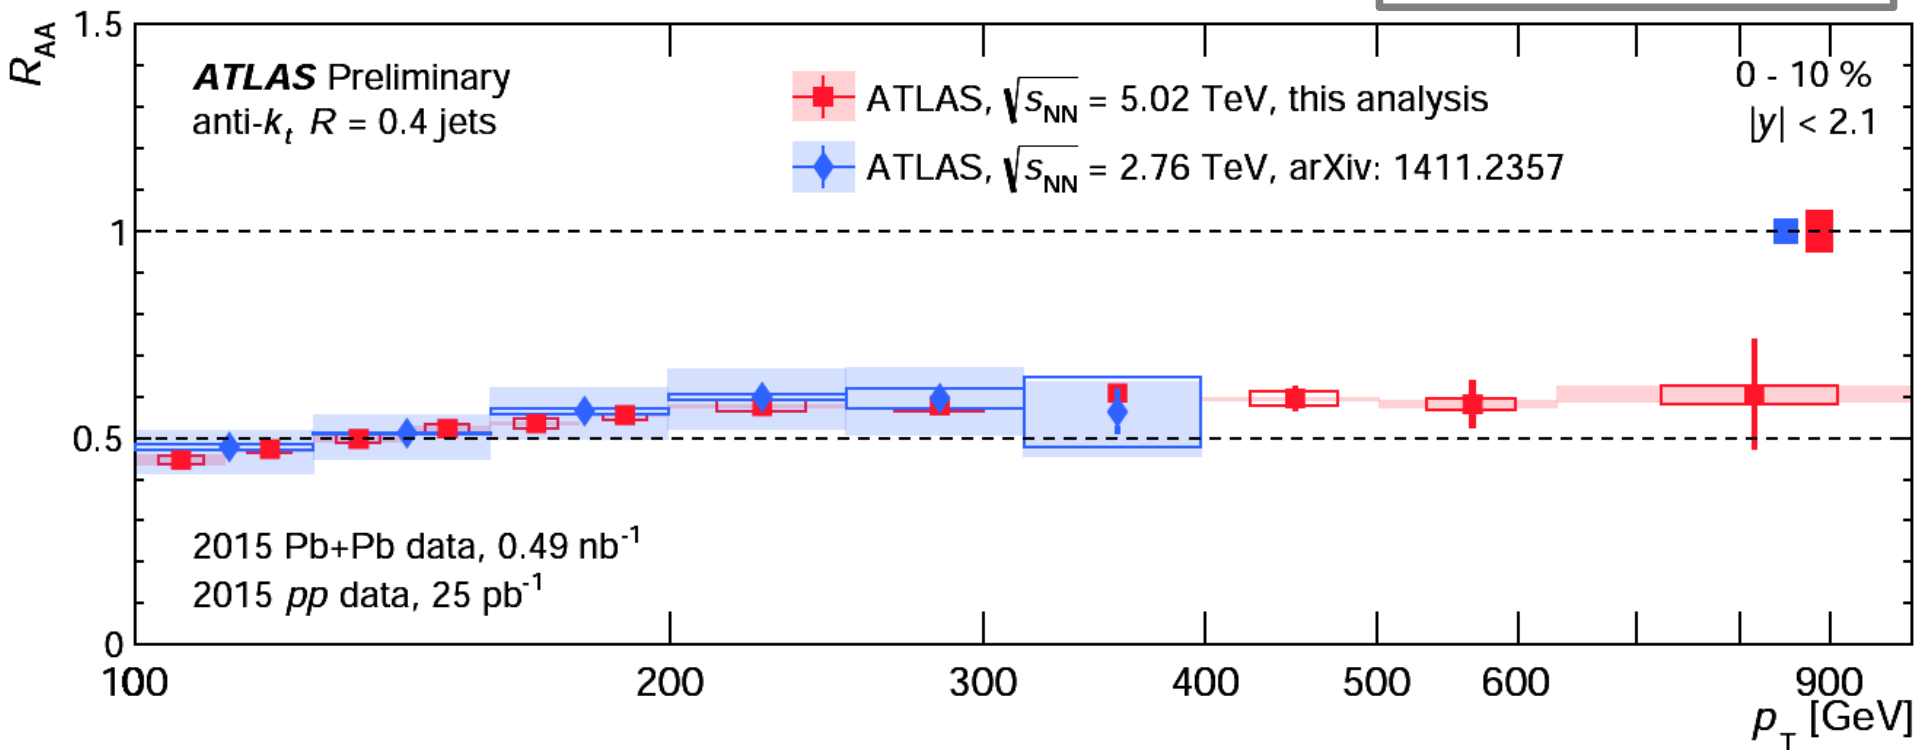

- Quantifying jet R_{AA} in the p_T range of **100 GeV to 1 TeV** and for $|y| < 2.8$.
- Allows for **detailed comparison** with predictions e.g.: X-N Wang et al. ([arXiv:1611.07211](https://arxiv.org/abs/1611.07211)), Chien and Vitev ([arXiv:1509.07257](https://arxiv.org/abs/1509.07257)), Casalderrey-Solana et al. ([arXiv:1508.00815](https://arxiv.org/abs/1508.00815)).

Jet R_{AA} : p_T -dependence, 2.76 TeV versus 5.02 TeV

ATLAS-CONF-2017-009

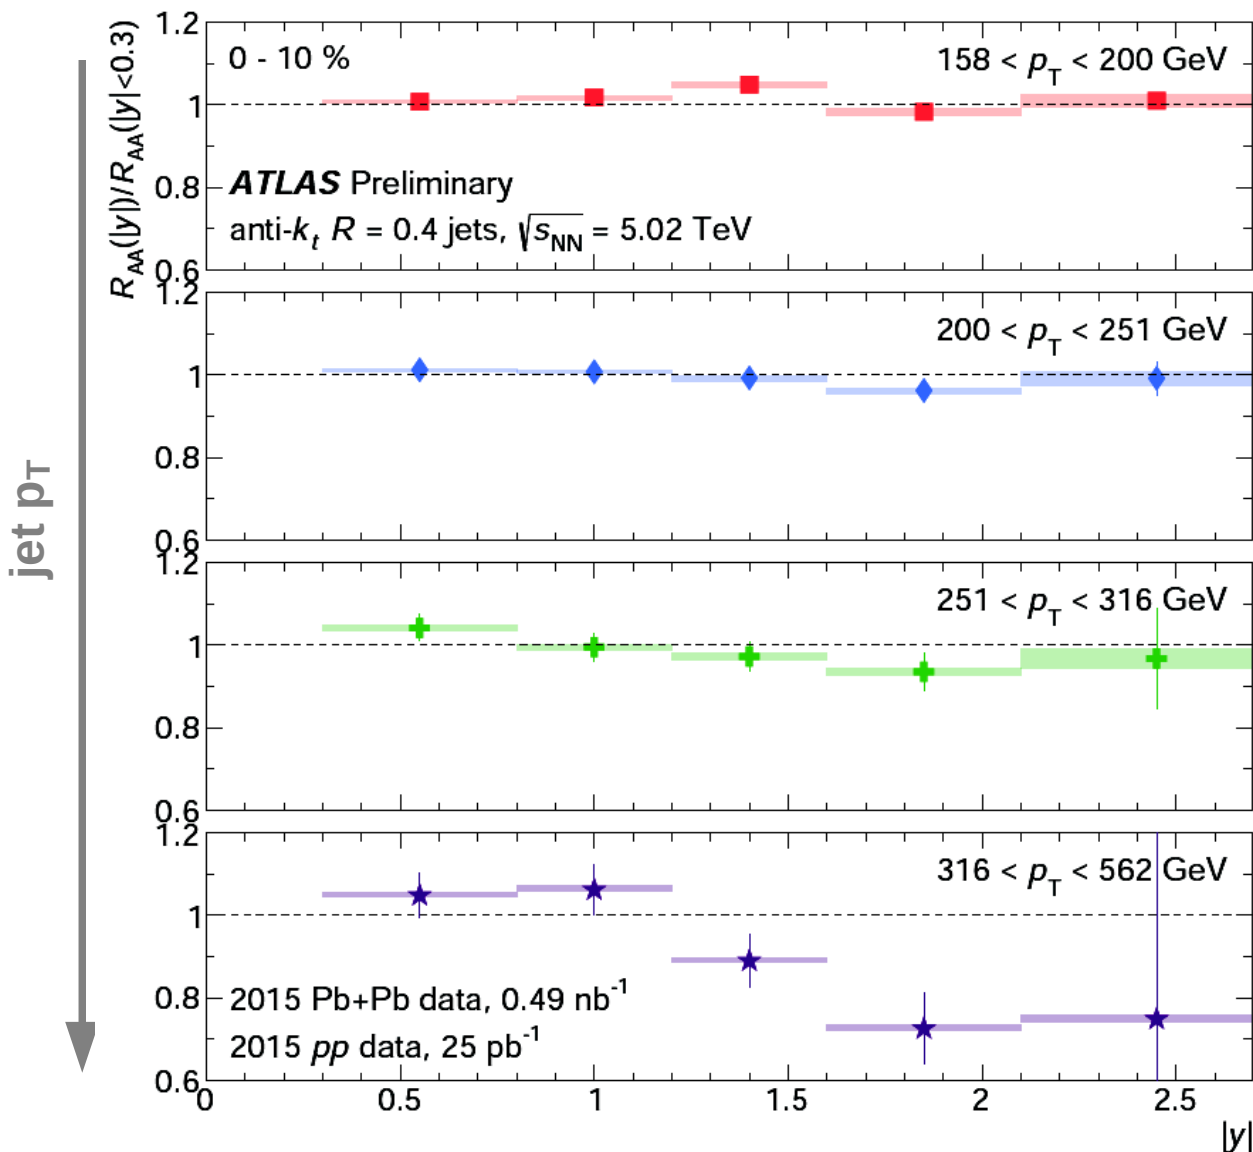

- **Same magnitude** of R_{AA} within systematic uncertainties seen at the two different center-of-mass energies.

Jet R_{AA} : y -dependence, $\sqrt{s_{NN}} = 5.02$ TeV

ATLAS-CONF-2017-009

- Vertical-axis: ratio of R_{AA} in a given rapidity to the R_{AA} for jets with $|y|<0.3$.
- With increasing jet p_T R_{AA} getting **smaller in the forward region** as compared to the mid-rapidity region (predicted in [arXiv:1504.05169](https://arxiv.org/abs/1504.05169)).

Jet fragmentation at 2.76 TeV

EPJC 77 (2017) no.6, 379

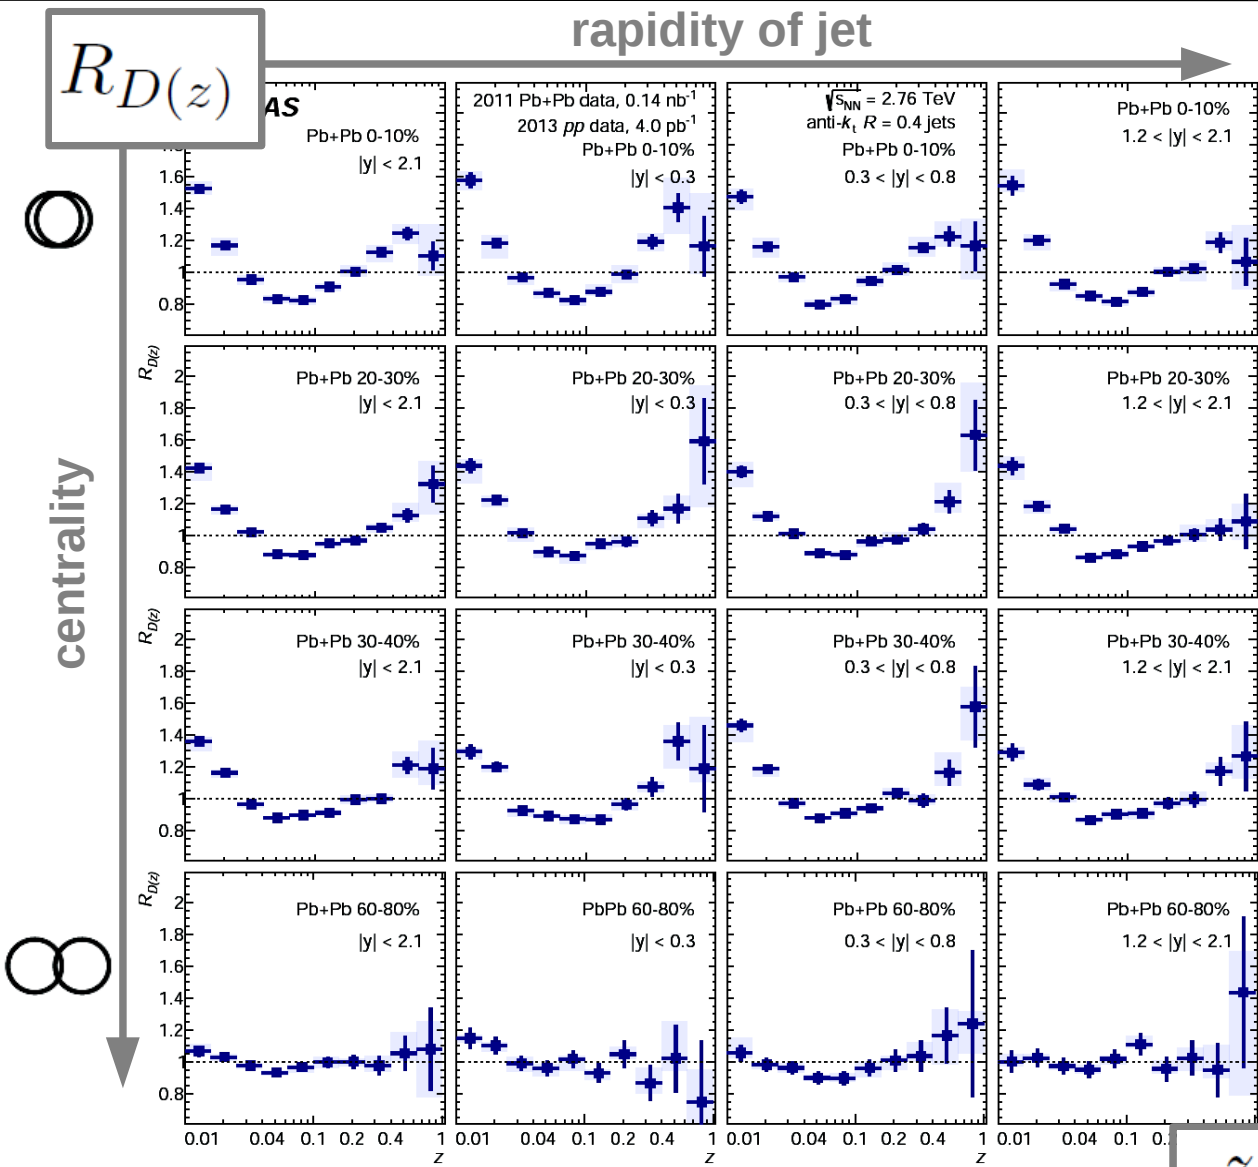

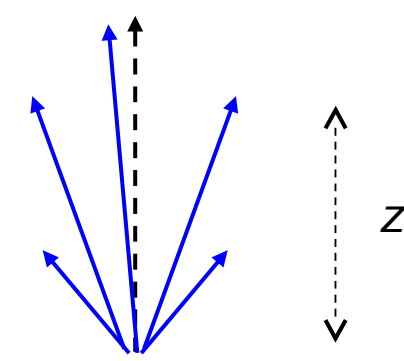

$R_D(z)$

rapidity of jet

$$R_D(z) = \frac{D(z)|_{\text{cent}}}{D(z)|_{pp}}$$

$$D(z) = \frac{1}{N_{jet}} \frac{dN}{dz}$$

$$z = \frac{p_T}{p_T^{jet}} \cos \Delta R$$

z

Jet fragmentation at 2.76 TeV

now published

EPJC 77 (2017) no.6, 379

$R_D(z)$

rapidity of jet

Centrality dependence

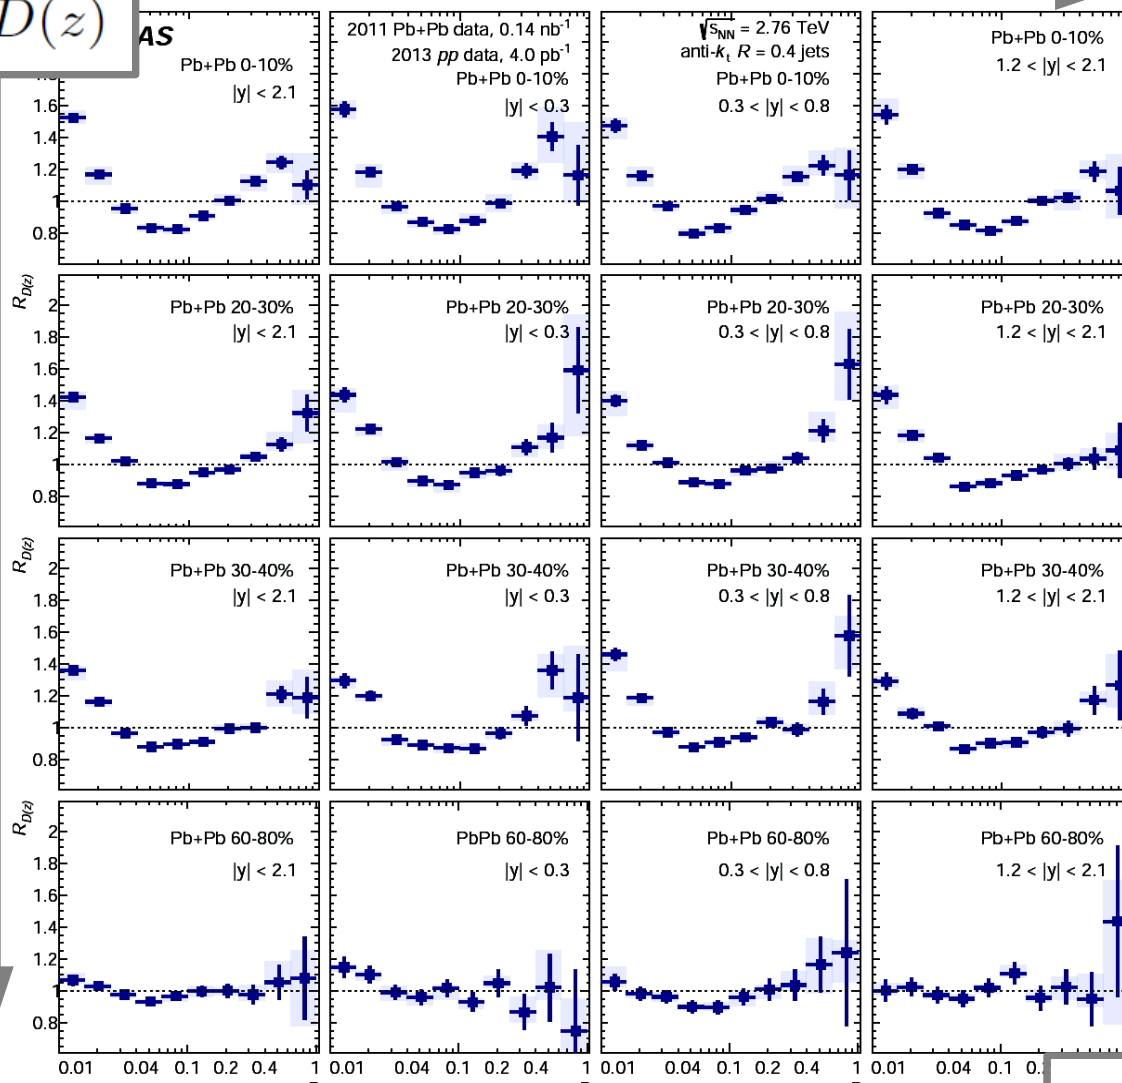

- Enhancement at low z and at high z
- Suppression at intermediate z

Rapidity dependence

- No rapidity dependence except for the highest z values (hint of a smaller enhancement for more forward jets)

Jet p_T dependence

- No significant dependence on jet p_T (not shown here)

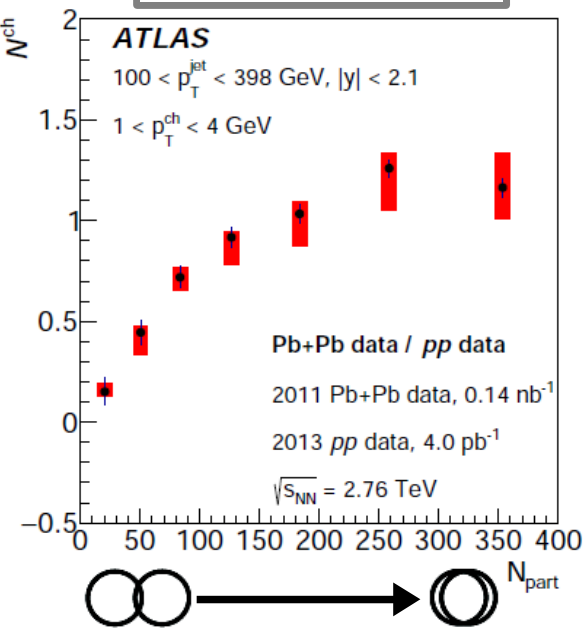

Jet fragmentation at 2.76 TeV

now published

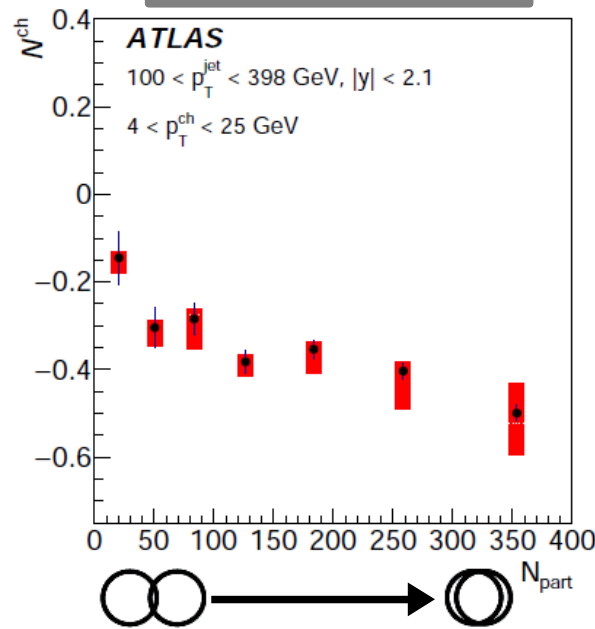

EPJC 77 (2017) no.6, 379

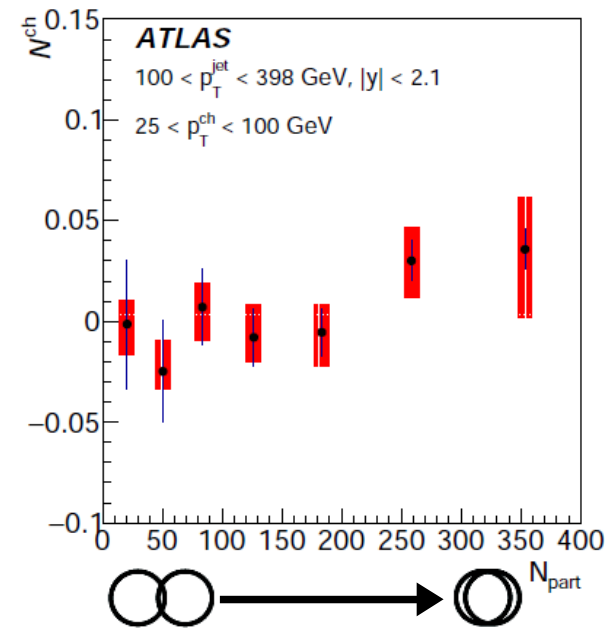

$1 < p_T^{\text{ch}} < 4 \text{ GeV}$

$4 < p_T^{\text{ch}} < 25 \text{ GeV}$

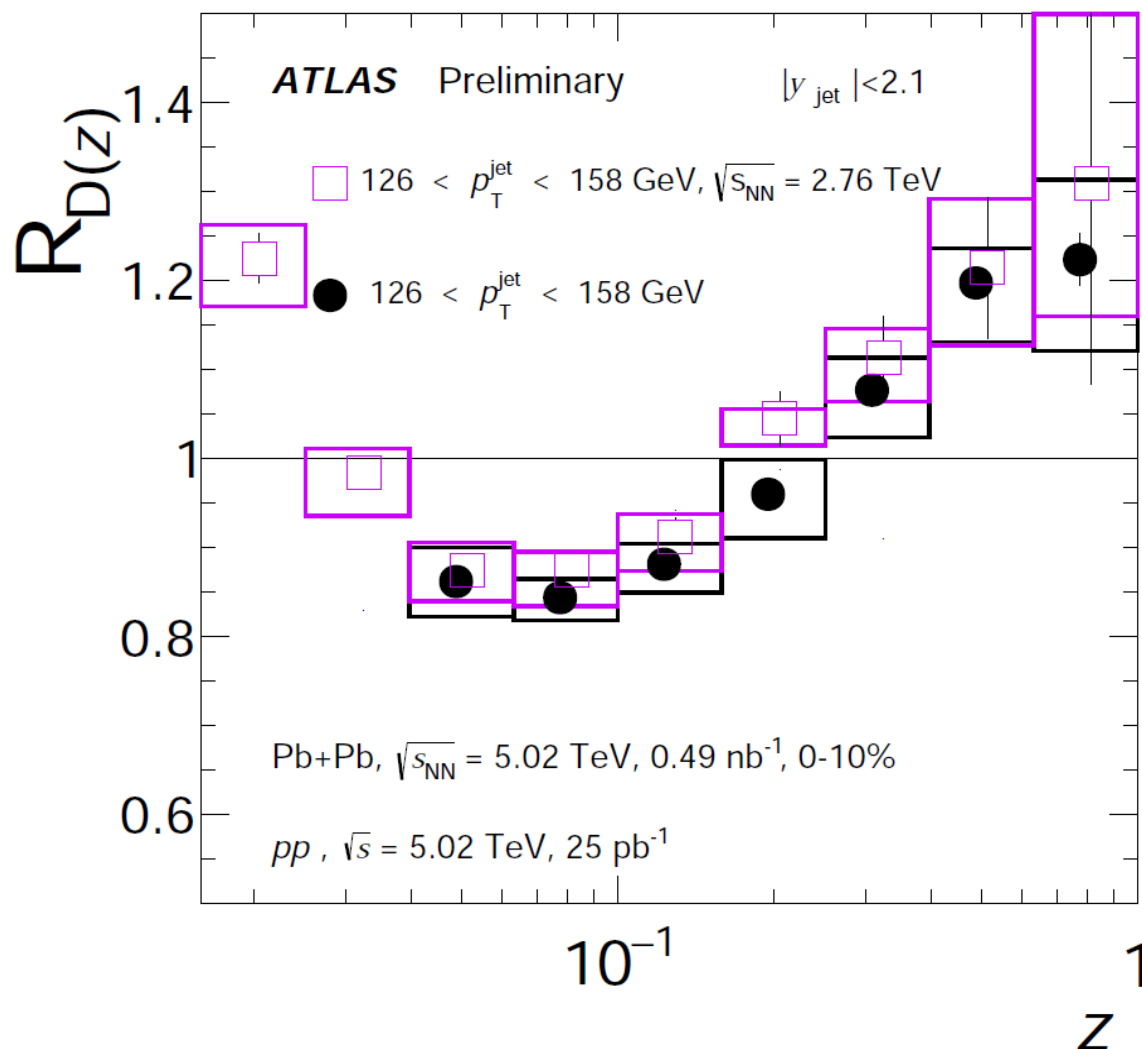

$25 < p_T^{\text{ch}} < 100 \text{ GeV}$

- To quantify the flow of particles: $N^{\text{ch}} \equiv \int_{p_{\text{T,min}}}^{p_{\text{T,max}}} \left(D(p_{\text{T}})|_{\text{cent}} - D(p_{\text{T}})|_{\text{pp}} \right) dp_{\text{T}}$
- ... quantifies number of missing/extra particles
- Also measured was first moment (see backup)

Jet fragmentation at 5.02 TeV

ATLAS-CONF-2017-005

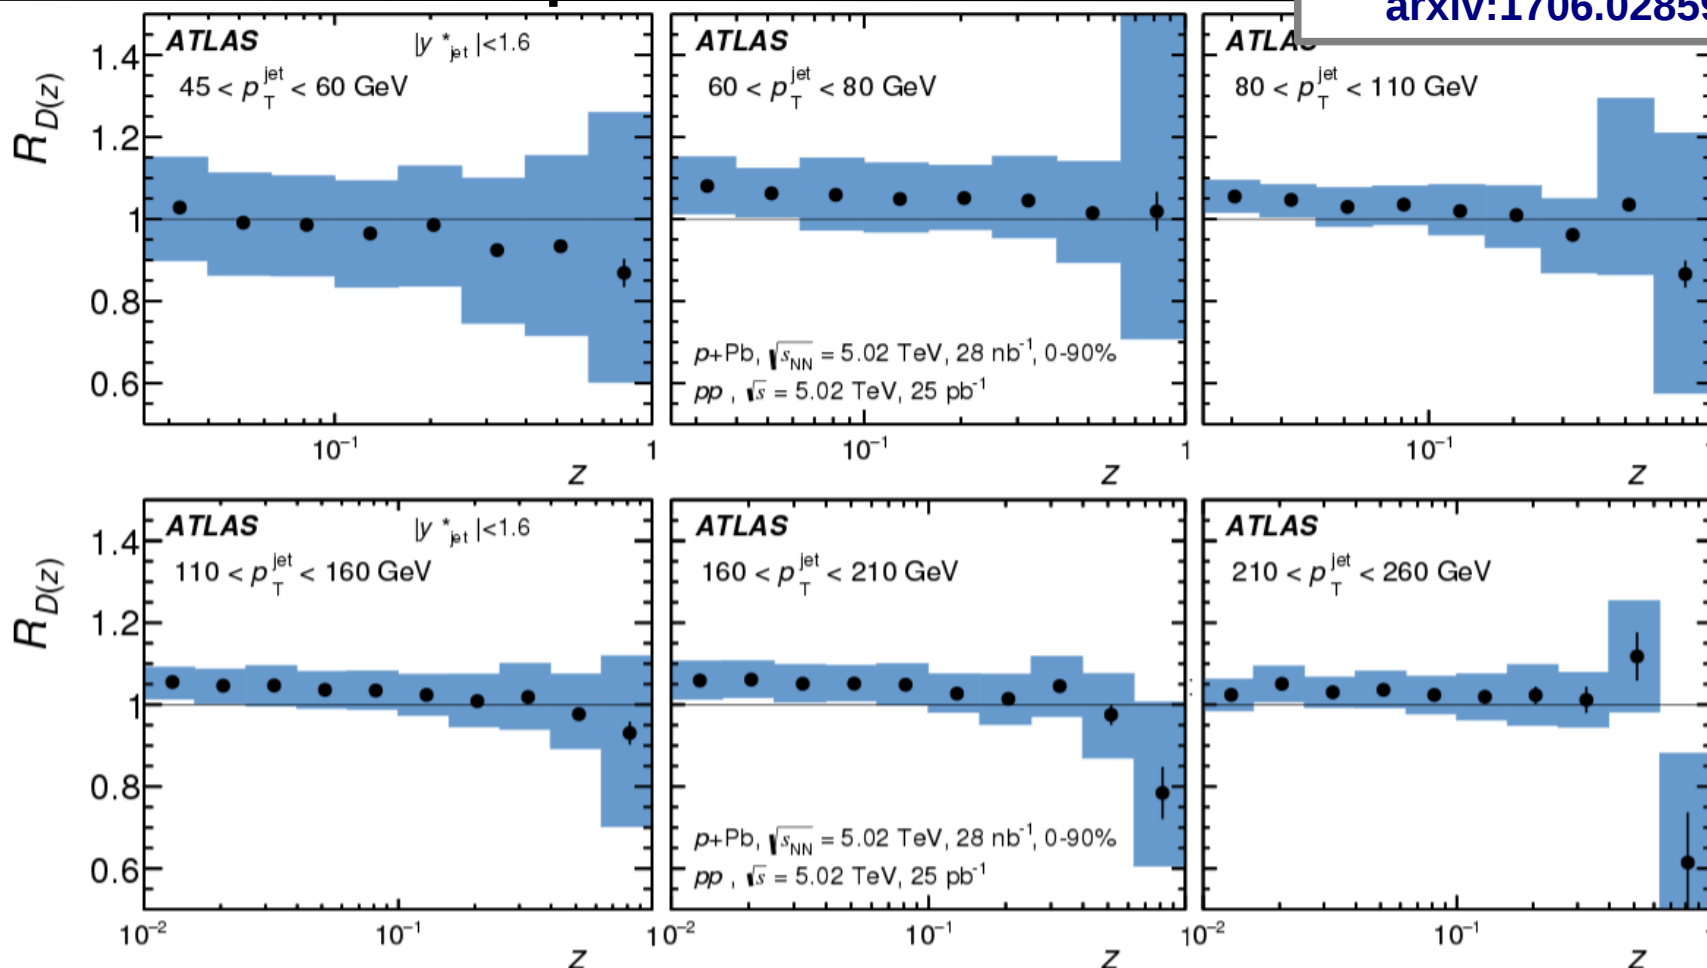

- Ratios of $D(z)$ distributions for tracks with $p_T > 4 \text{ GeV}$.
- 5.02 TeV measurement **agrees with 2.76 TeV** measurement at the comparable z domain

Jet fragmentation in p+Pb at 5.02 TeV

final

arxiv:1706.02859

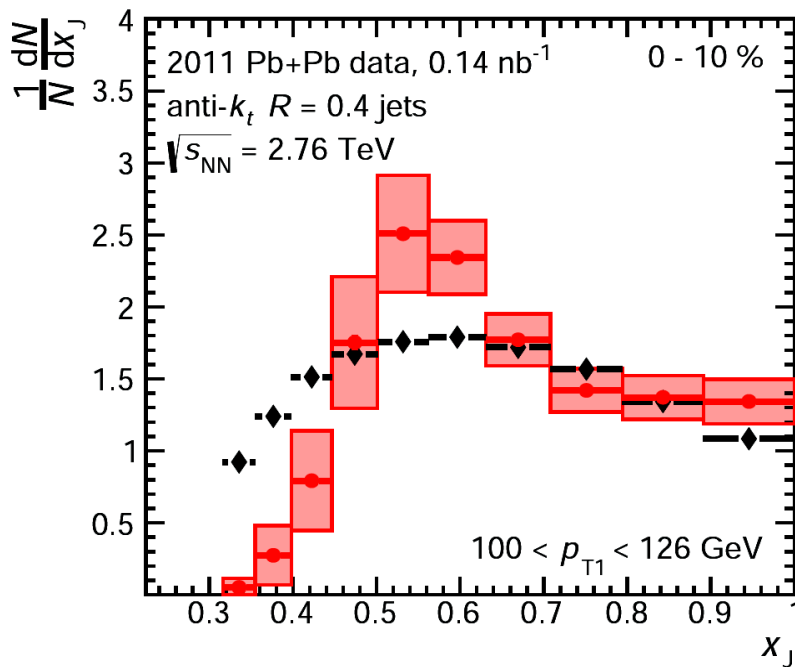

- Ratios of $D(z)$ and $D(p_T)$ distributions measured in **5.02 TeV p+Pb** collisions.
- **No modifications** of the jet internal structure seen in the p+Pb environment.

Dijet production

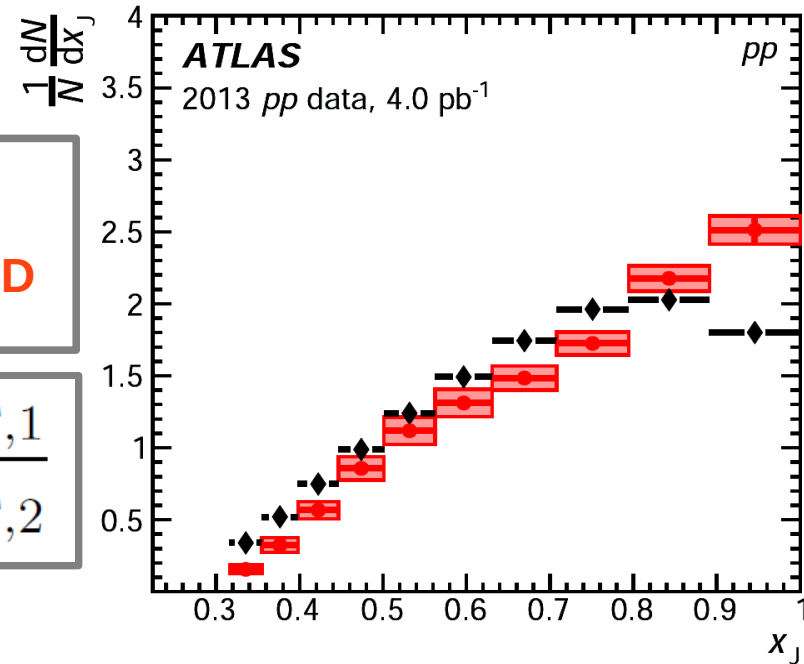

final

arxiv:1706.09363

RAW
UNFOLDED

$$x_J = \frac{p_{T,1}}{p_{T,2}}$$

- Fully **particle-level corrected** dijet asymmetry measurement
- Uses 2D bayesian unfolding to correct for the detector effects in p_{T1} and p_{T2} simultaneously
- Energy loss **very different for two jets** in the system

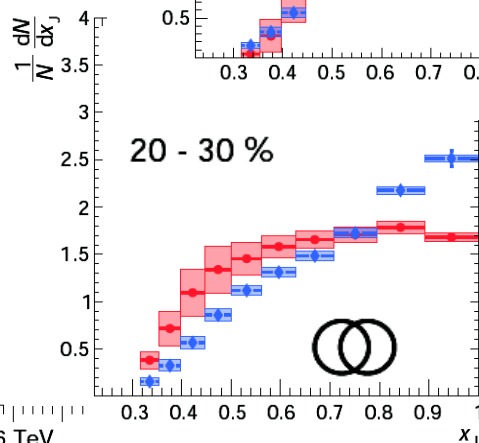

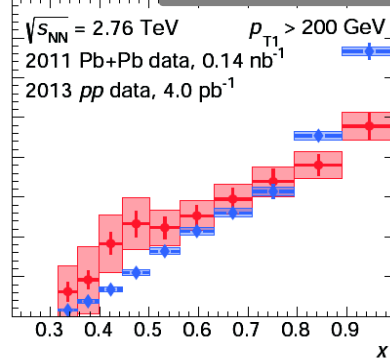

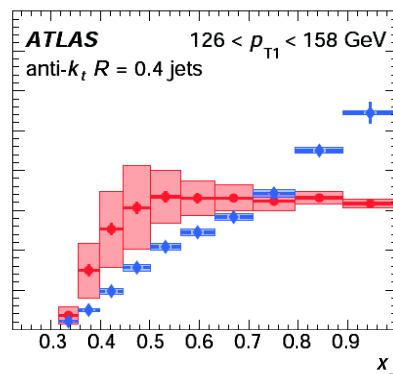

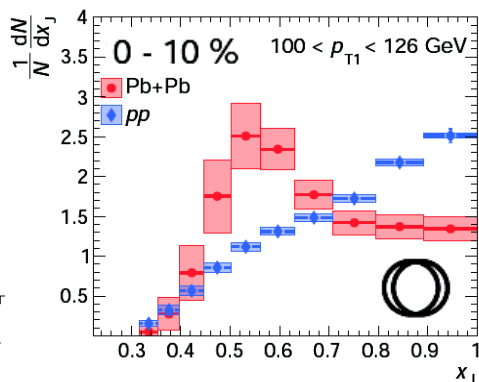

Dijet production

final

pt of jet

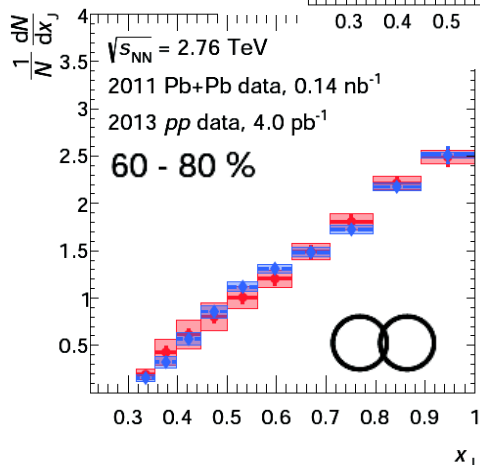

arxiv:1706.09363

centrality

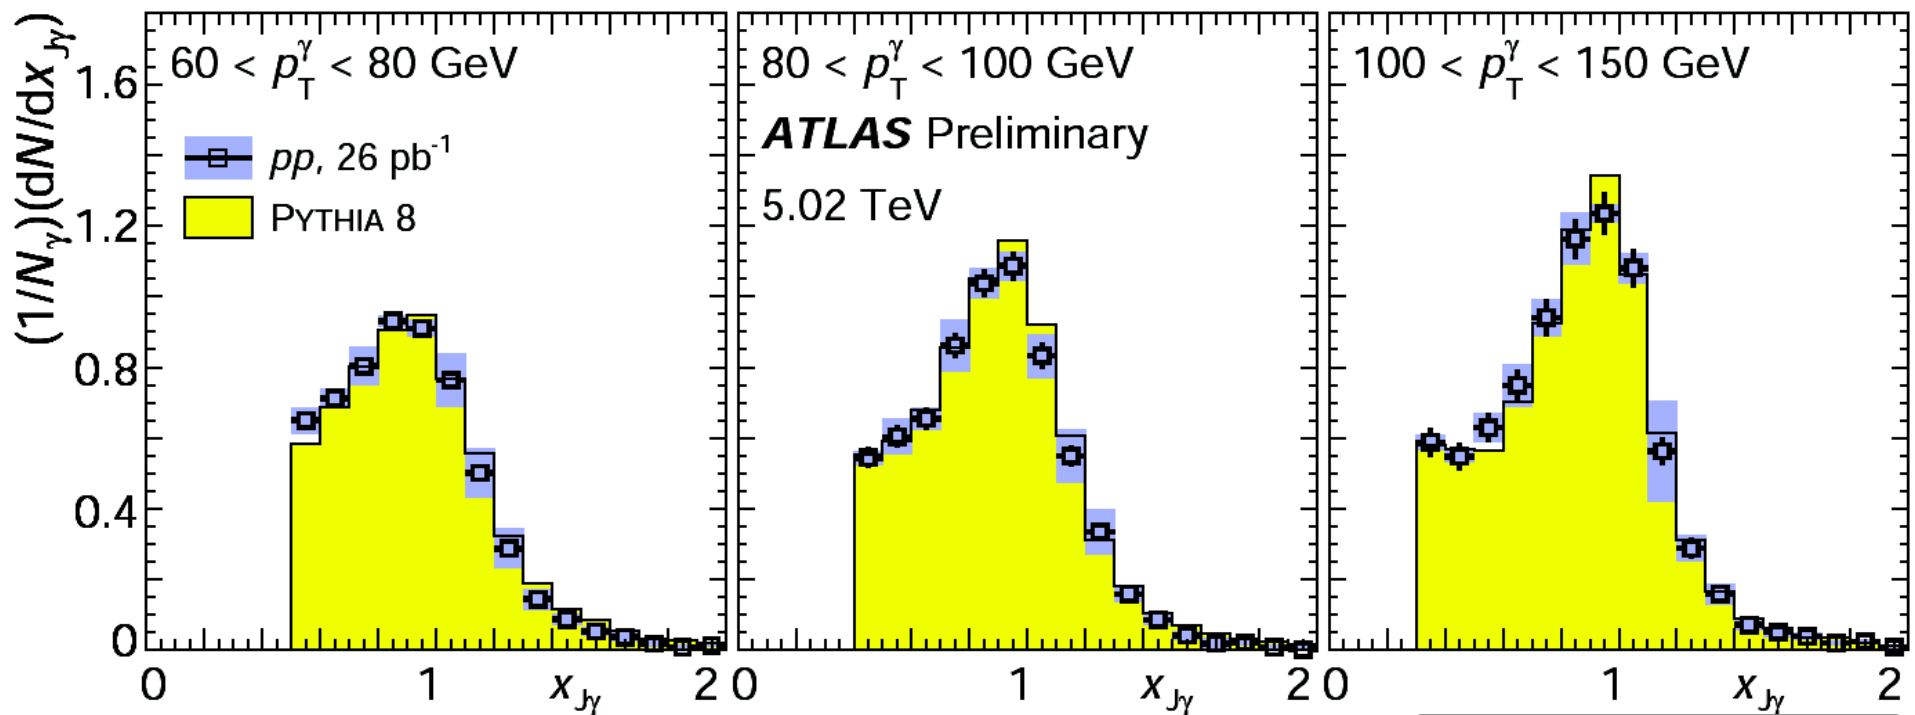

Pb+Pb
pp

Pronounced jet pt
dependence,
high-pt jets almost
unmodified

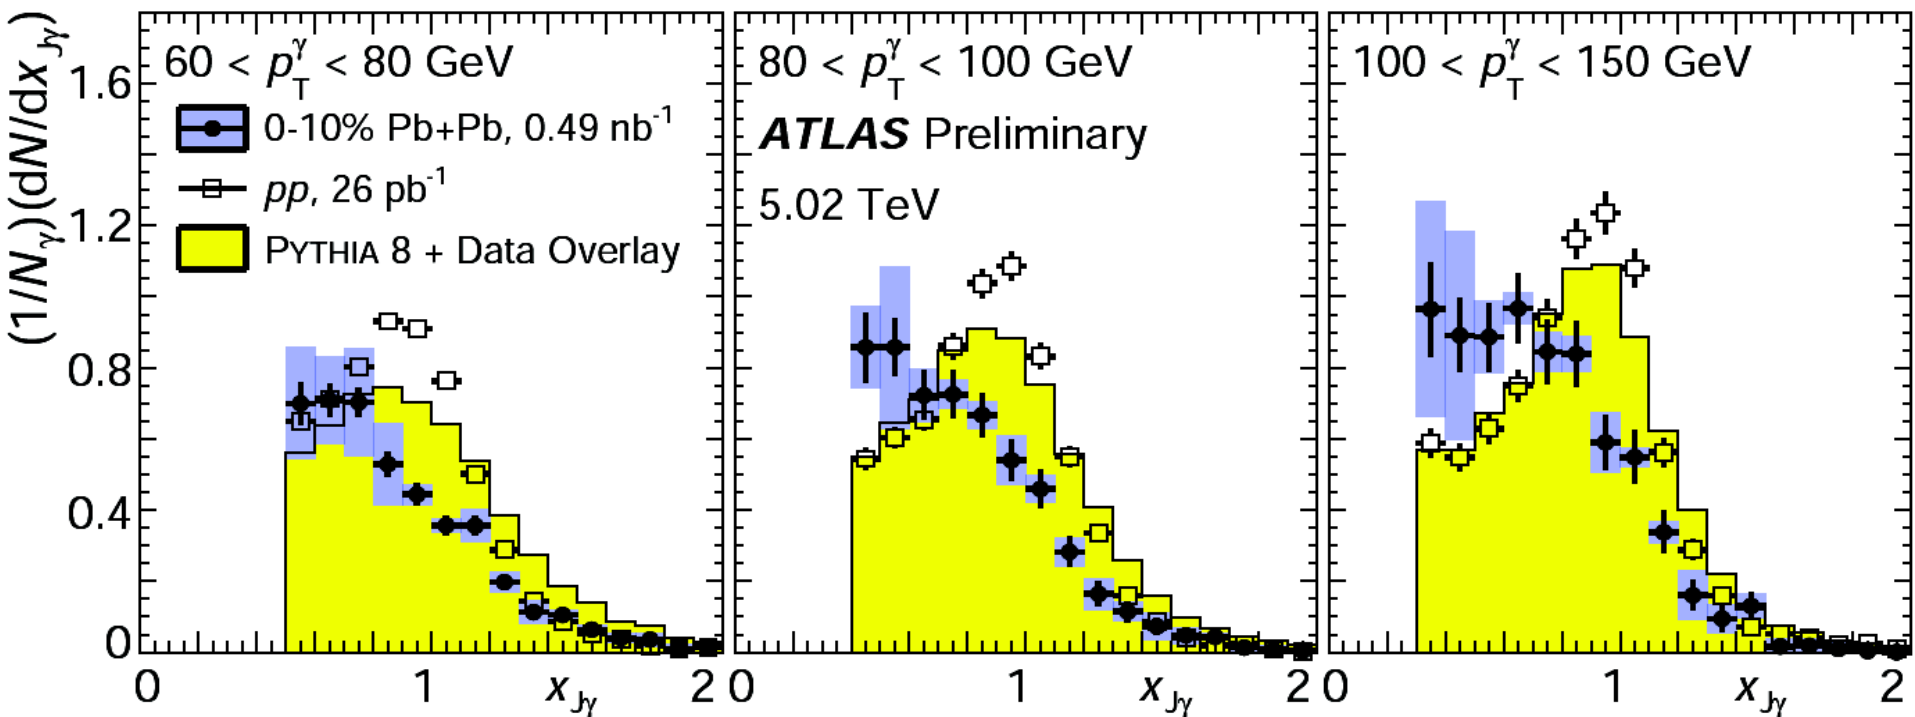

Clear centrality dependence.
0-10%: most probable value ~ 0.5 .
60-80%: consistent with pp.

$$x_J = p_{T,1}/p_{T,2}$$

- Good agreement between PYTHIA8 and pp data
- Not unfolded for the detector response

$$x_{J\gamma} = \frac{p_{T,\text{jet}}}{p_\gamma}$$

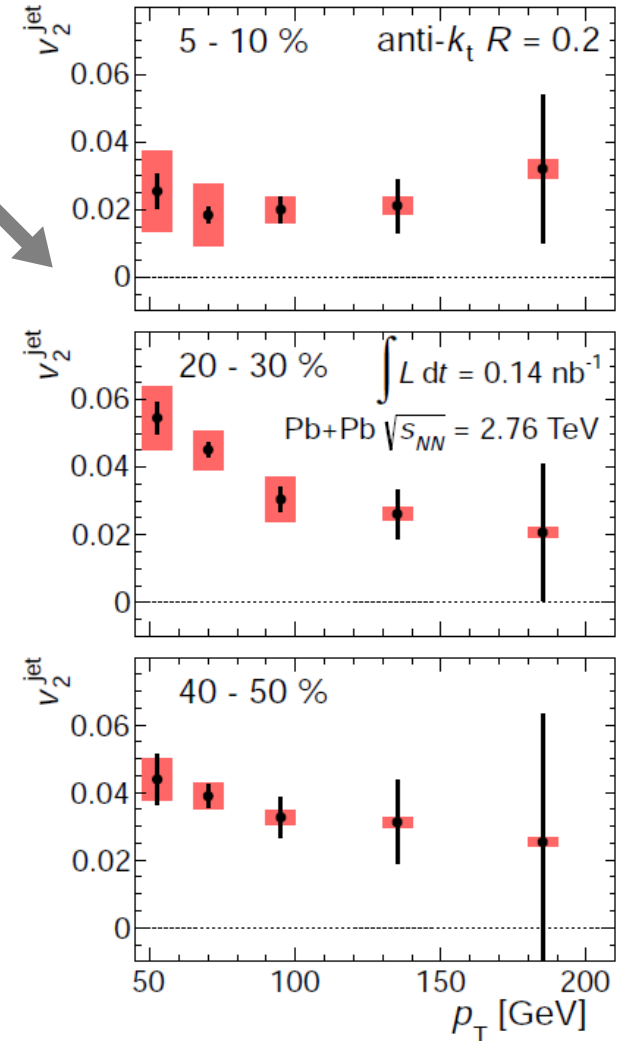

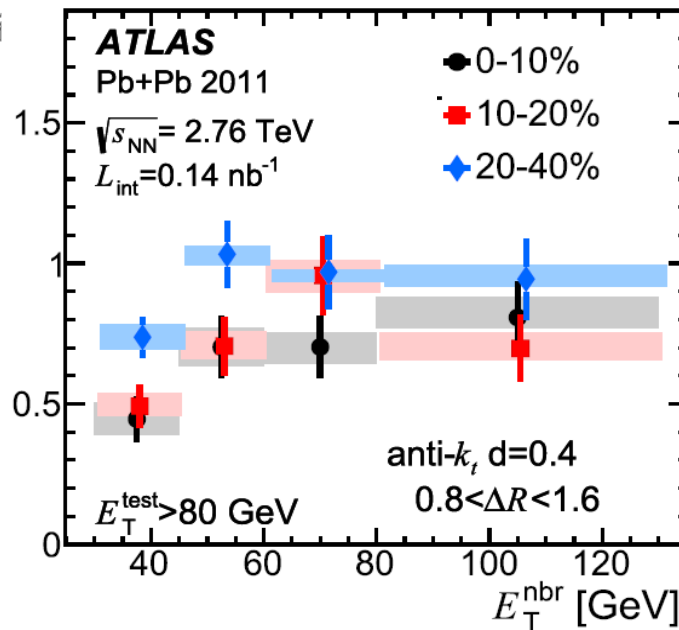

$$x_{J\gamma} = \frac{p_{T,jet}}{p_\gamma}$$

- Clear modification (downward shift) due to the parton **energy loss of the balancing jet**.
- Not shown is centrality dependence – smaller effect in less central collisions

Other published jet results with Pb+Pb collisions (2013+)

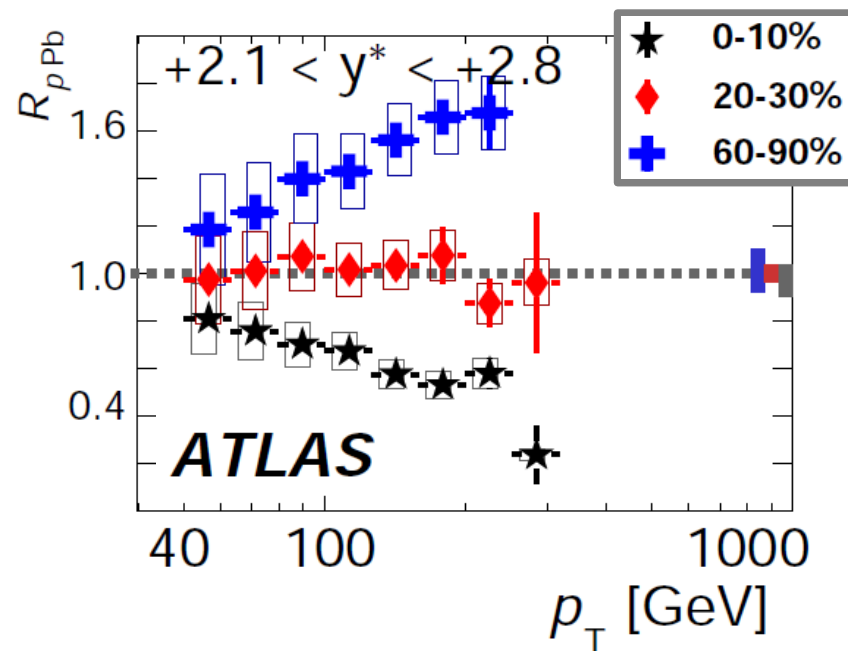

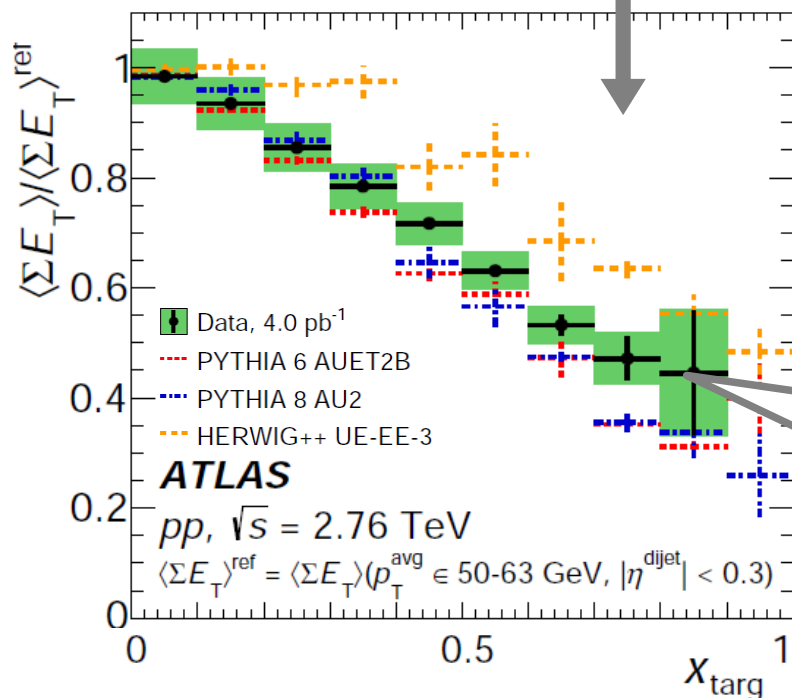

- Jet R_{CP} (PLB 719 (2013) 220)
- Azimuthal angle dependence of inclusive jets (PRL 111 (2013) no.15, 152301)
- Jet fragmentation I. (PLB 739 (2014) 320)
- Small angle jet pairs (PLB 751 (2015) 376)

Central-to-peripheral ratio of nearby jet yield

Other jet results with p+Pb and pp collisions

- Jet production in p+Pb
(PLB 748 (2015) 392)
- Jet and forward E_T correlations in pp
(PLB 756 (2016) 10)

Forward UE production **depleted**
 if x-target is large,
 but only a modest variation with
 varying x-projectile (not shown)

Summary

- Jet R_{AA} measured differentially in centrality, rapidity and up to 1 TeV
- Jet internal structure measured differentially centrality, jet p_t and rapidity in pp , Pb+Pb, and p +Pb collisions
- Fully corrected di-jet measurement exhibits very pronounced difference between Pb+Pb and pp collisions
- Uncorrected photon-jet measurement exhibits a significant suppression of balancing jet

5.02 TeV

Jet yields in Pb+Pb collisions

2.76 TeV

5.02 TeV

Correlations between soft and hard production in pp

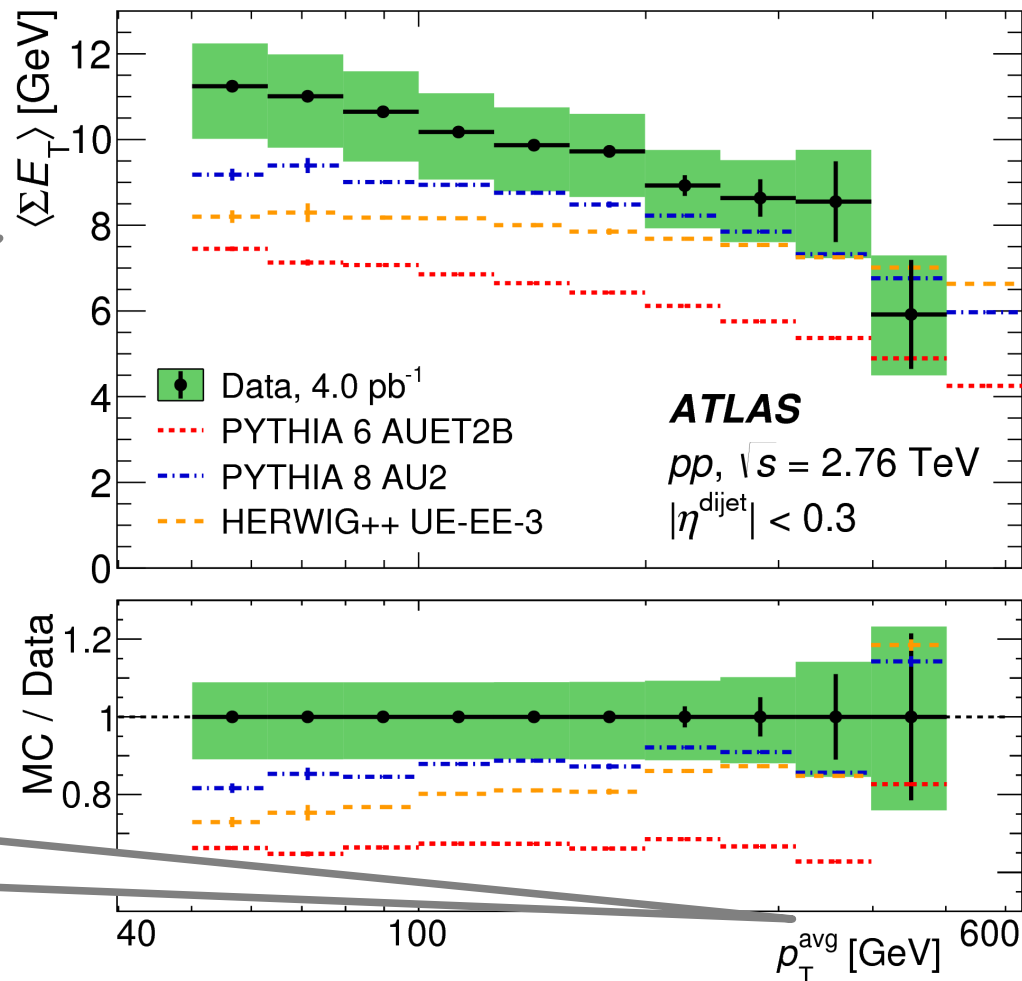

PLB 756 (2016) 10-28

- **What is measured:** correlation between the dijet kinematics and the magnitude of the UE in the forward region **in pp collisions**
- **Motivation:** modeling of particle production, reference measurement to **better understand the centrality in p+Pb**

$\langle \Sigma E_T \rangle$ of UE in the forward region
($-4.9 < \eta < -3.2$)

$(p_{T1} + p_{T2})/2$ of dijet

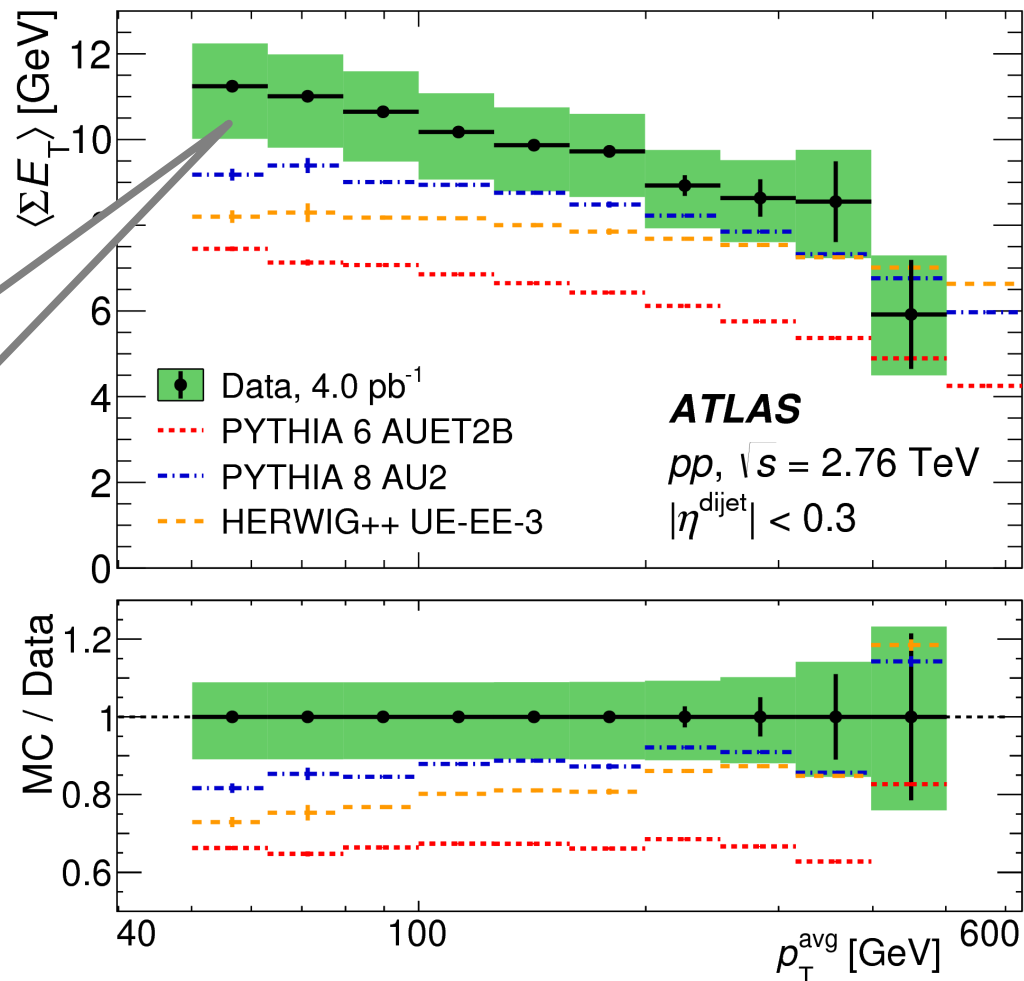

Correlations between soft and hard production in pp

PLB 756 (2016) 10-28

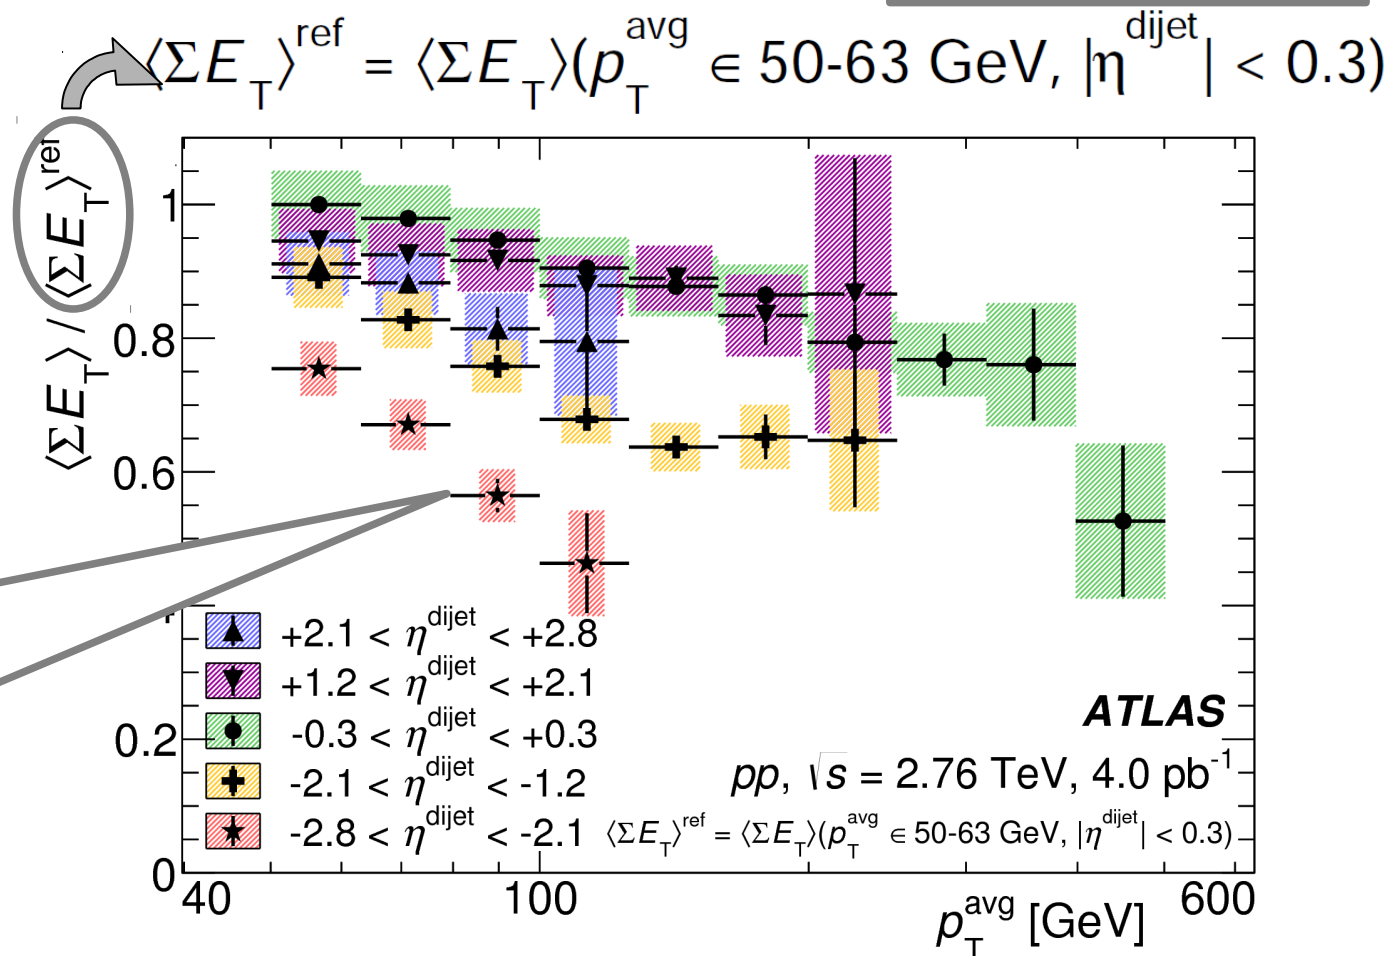

- **What is measured:** correlation between the dijet kinematics and the magnitude of the UE in the forward region in pp collisions
- **Motivation:** modeling of particle production, reference measurement to **better understand the centrality in p+Pb**

Anti-correlation between
“soft production”
and “hard production”

Correlations between soft and hard production in pp

PLB 756 (2016) 10-28

Anti-correlation is **stronger** when η_{dijet} approaches the ΣE_T measuring region

... this can be evaluated as a function of x-target and x-projectile (\sim Bjorken x)

Correlations between soft and hard production in pp

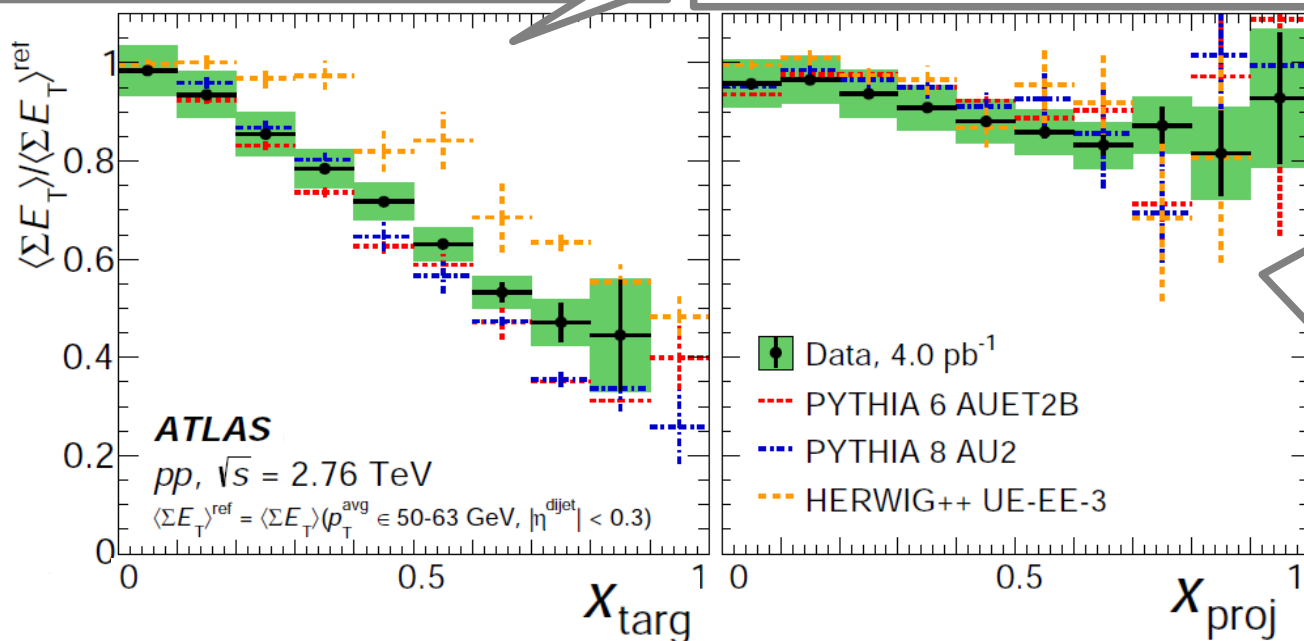

PLB 756 (2016) 10-28

$$x_{\text{proj/trag}} = \frac{p_{\text{T}}^{\text{avg}}}{\sqrt{s}} \left(e^{+\eta_1} + e^{+\eta_2} \right)$$

Forward UE production
depleted if x-target is large

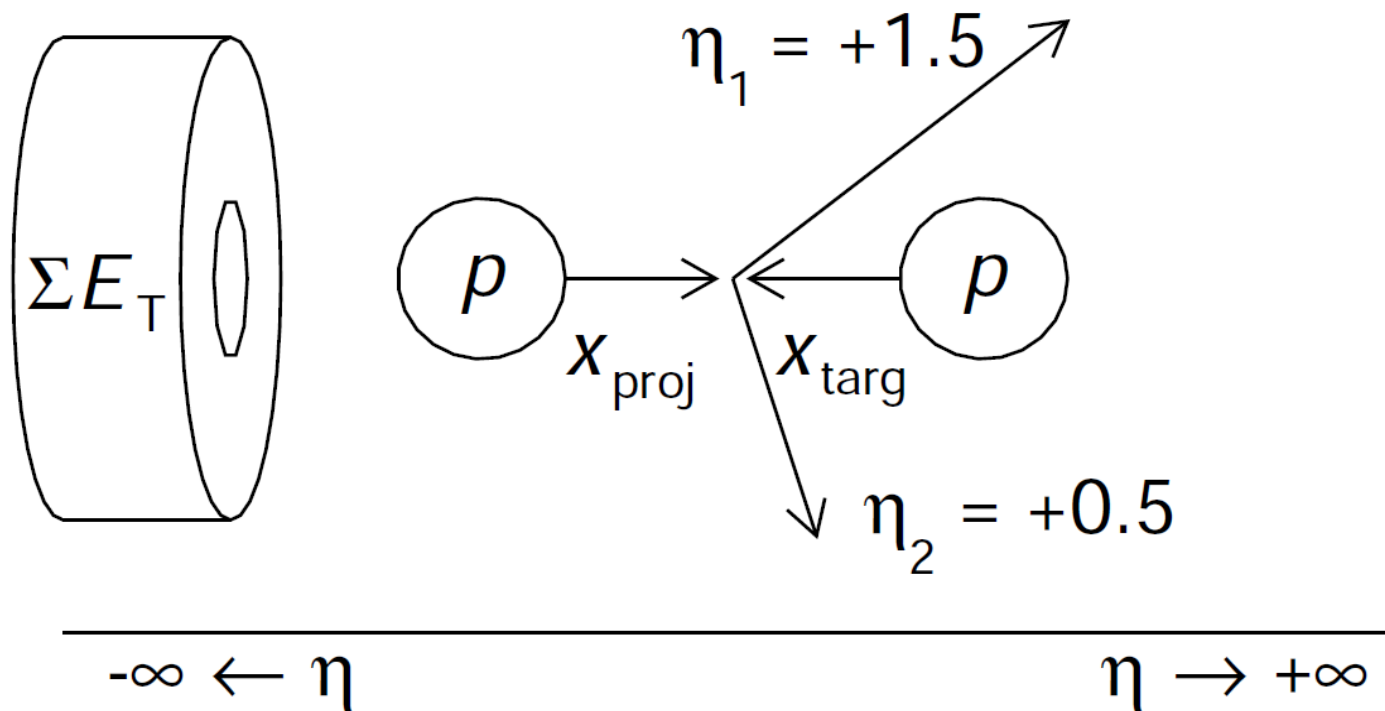

... but only
a modest
variation with
varying
x-projectile

The target is the analogue of the nucleus in **p+Pb** collisions, projectile analogue of proton ... small sensitivity of ΣE_{T} to x-projectile suggests that effects seen in p+Pb jets are **not due to trivial anti-correlation in individual nucleon-nucleon collisions** (e.g. “energy conservation”).

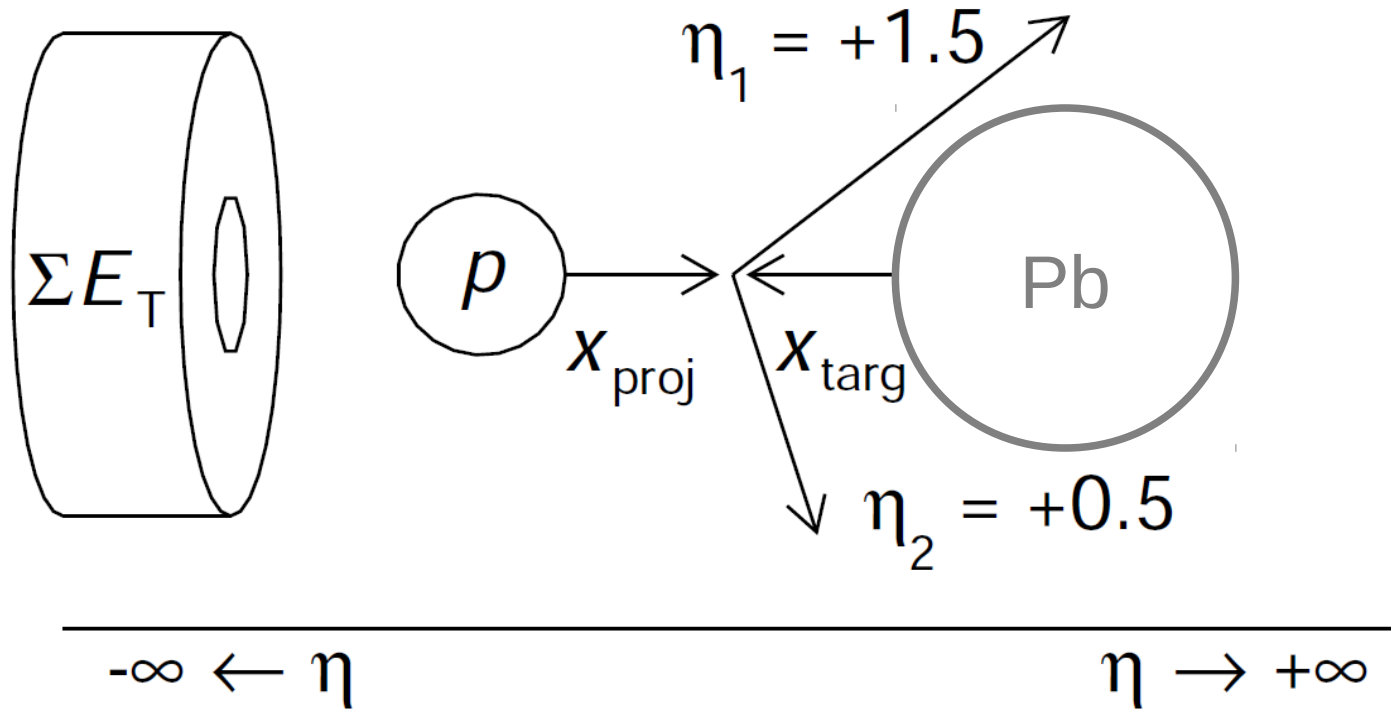

Correlations between soft and hard production in pp

$$x_{\text{proj/trag}} = \frac{p_{\text{T}}^{\text{avg}}}{\sqrt{s}} (e^{+\eta_1} + e^{+\eta_2})$$

Correlations between soft and hard production in pp

$$x_{\text{proj/trag}} = \frac{p_{\text{T}}^{\text{avg}}}{\sqrt{s}} (e^{+\eta_1} + e^{+\eta_2})$$

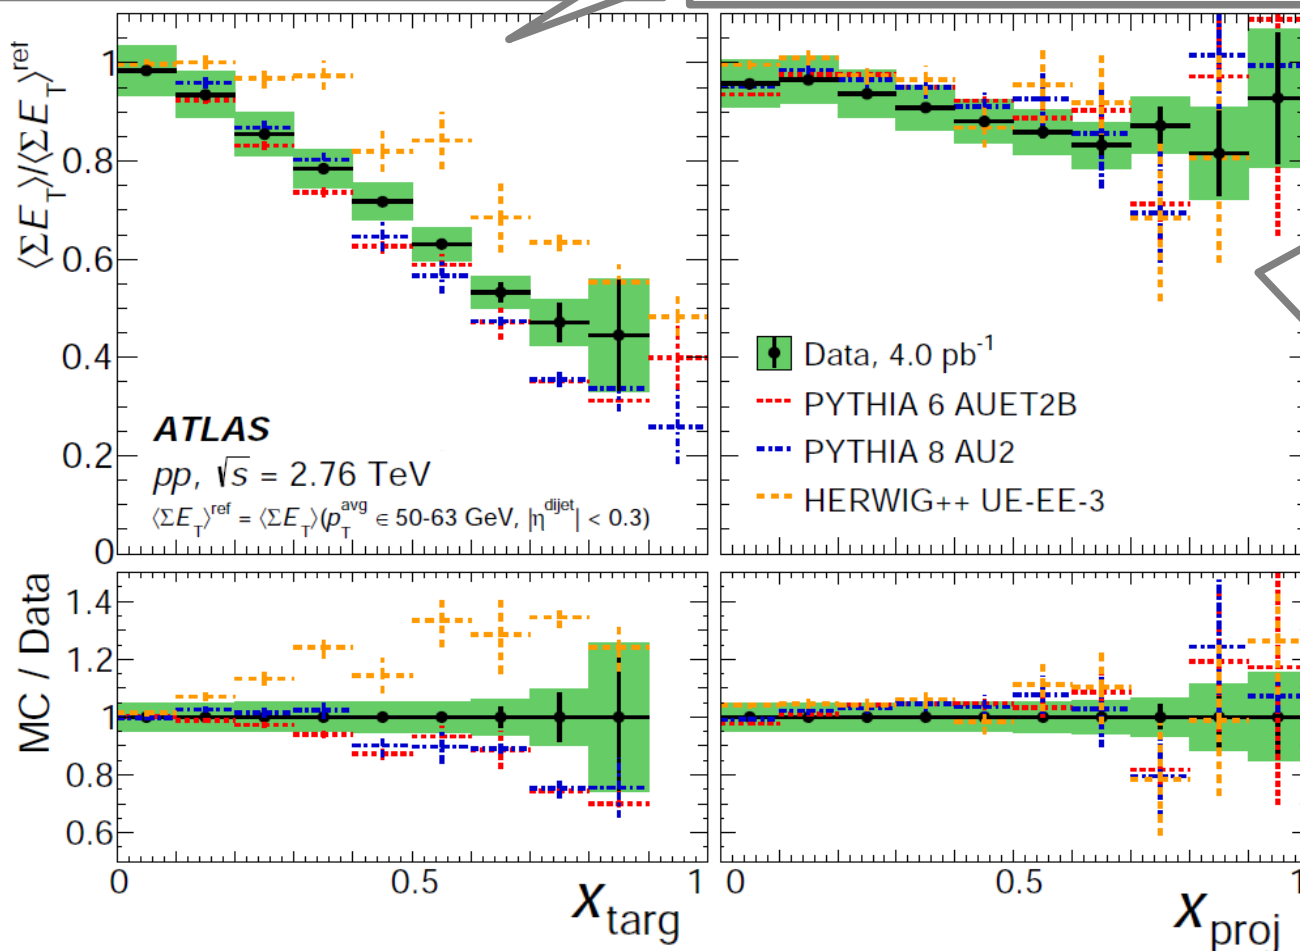

Correlations between soft and hard production in pp

$$x_{\text{proj/trag}} = \frac{p_{\text{T}}^{\text{avg}}}{\sqrt{s}} \left(e^{+\eta_1} + e^{+\eta_2} \right)$$

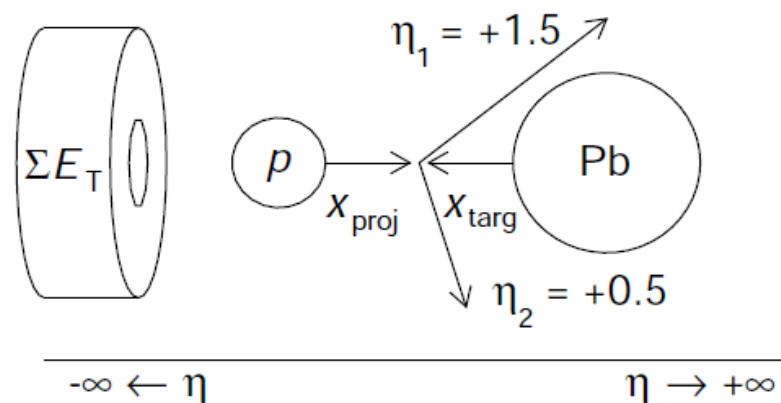

Forward UE production
depleted if x-target is large

... but only
a modest
variation with
varying
x-projectile

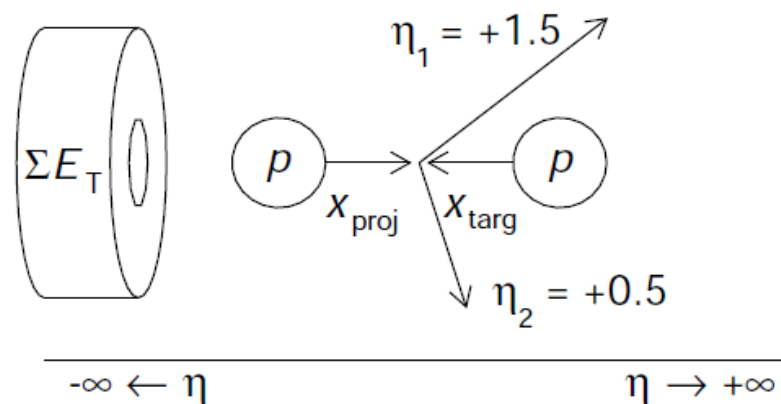

Correlations between soft and hard production in pp

(a) p +Pb collision

(b) pp collision

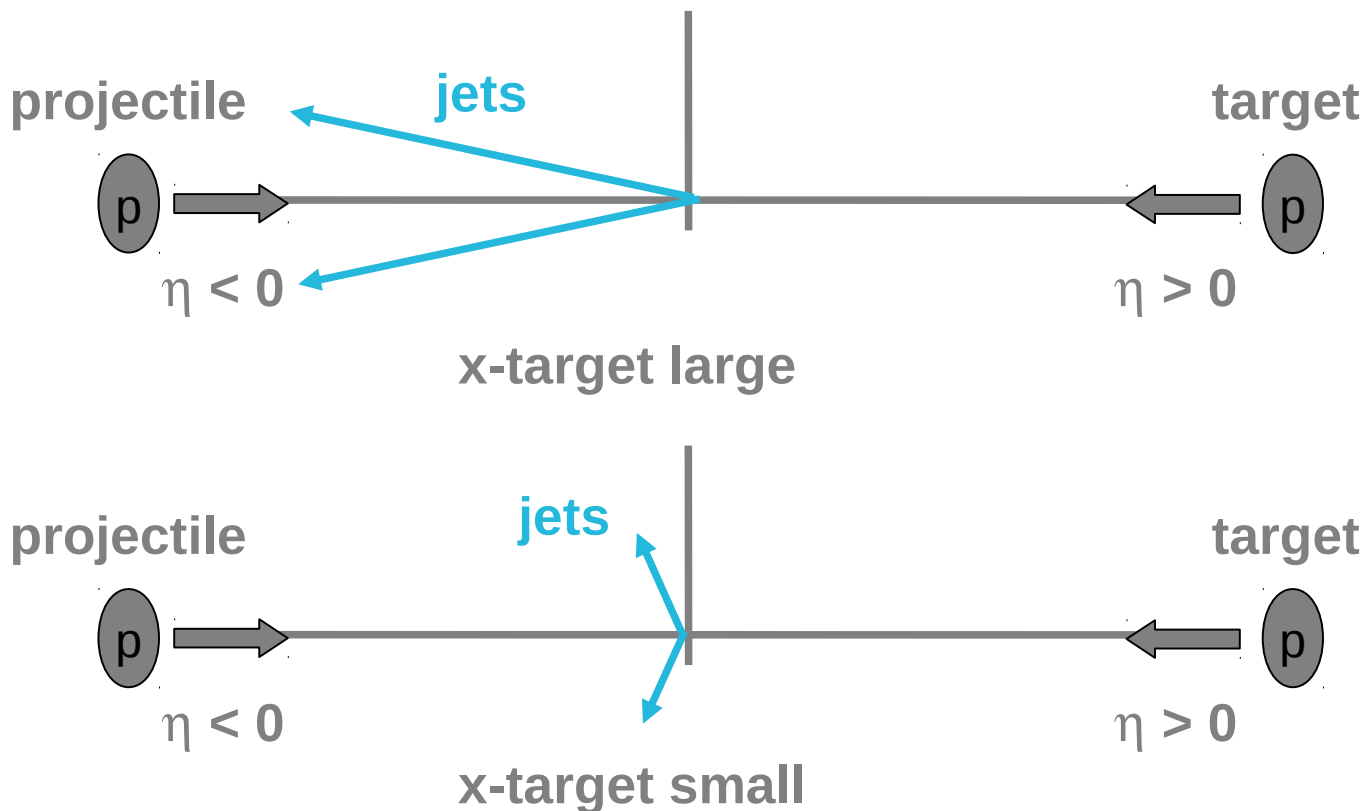

Correlations between soft and hard production in pp

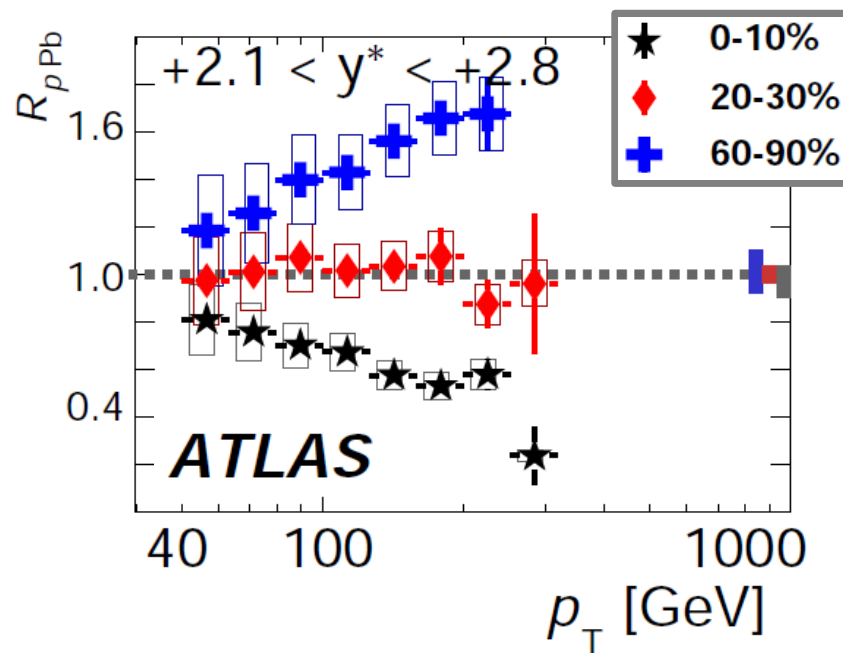

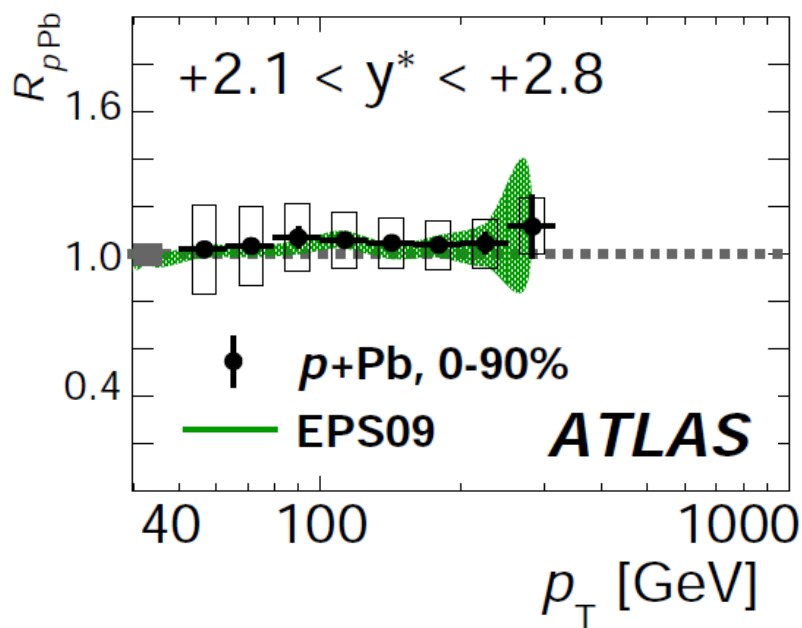

- Anti-correlation can be evaluated also **as a function of x-projectile and x-target**

$$x_{\text{proj/trag}} = \frac{p_{\text{T}}^{\text{avg}}}{\sqrt{s}} (e^{+\eta_1} + e^{+\eta_2})$$

- Example of configurations:

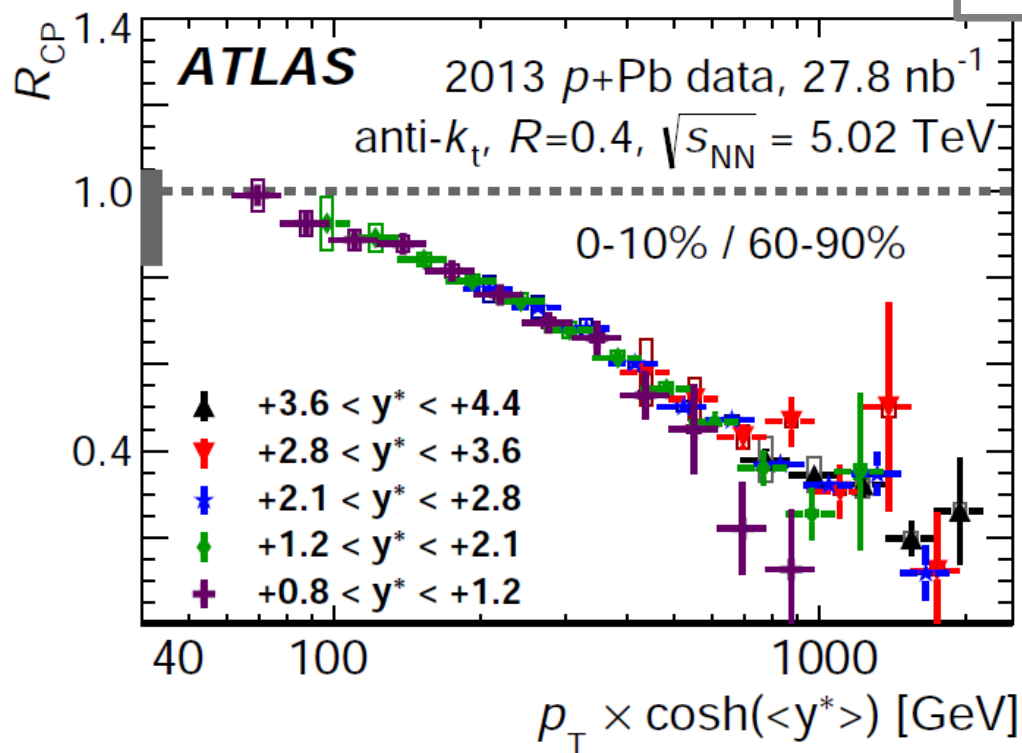

Inclusive jets

R_{pPb} for jets: While the R_{pPb} is consistent with unity when evaluated inclusively in centrality (left), it is **not unity when evaluated differentially in the centrality** (right).

Inclusive jets

PLB 748 (2015) 392-413

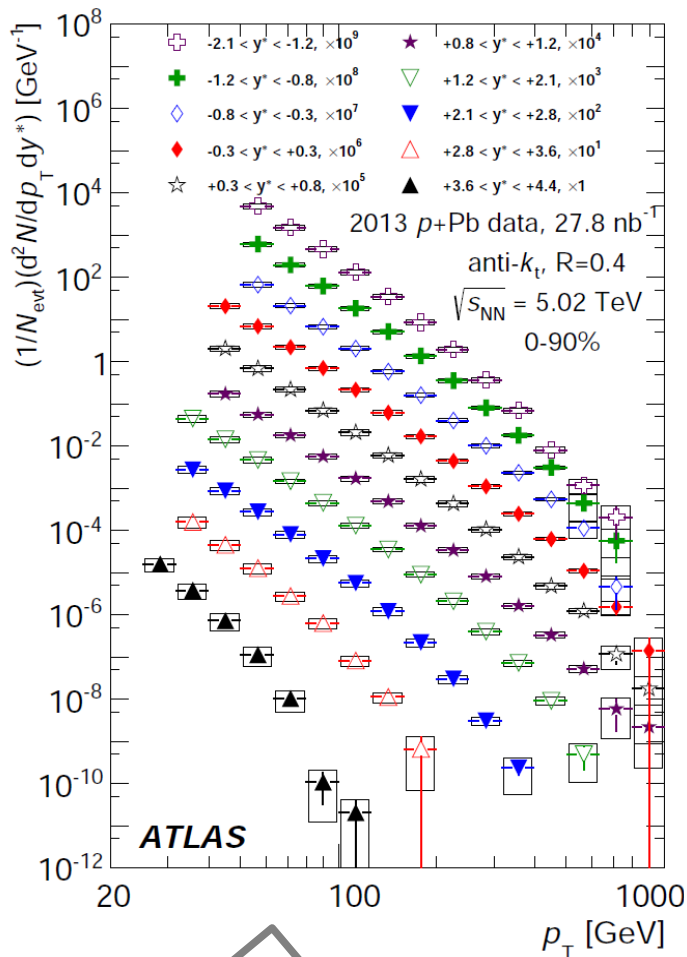

- R_{CP} / R_{pPb} scales with the total momentum of a jet for jets in the positive forward region suggesting a **dependence on x of parton in proton**.
- How much of the centrality dependence (= dependence on ΣE_T in the negative forward region) comes from the dependence of ΣE_T on x in individual NN collision?

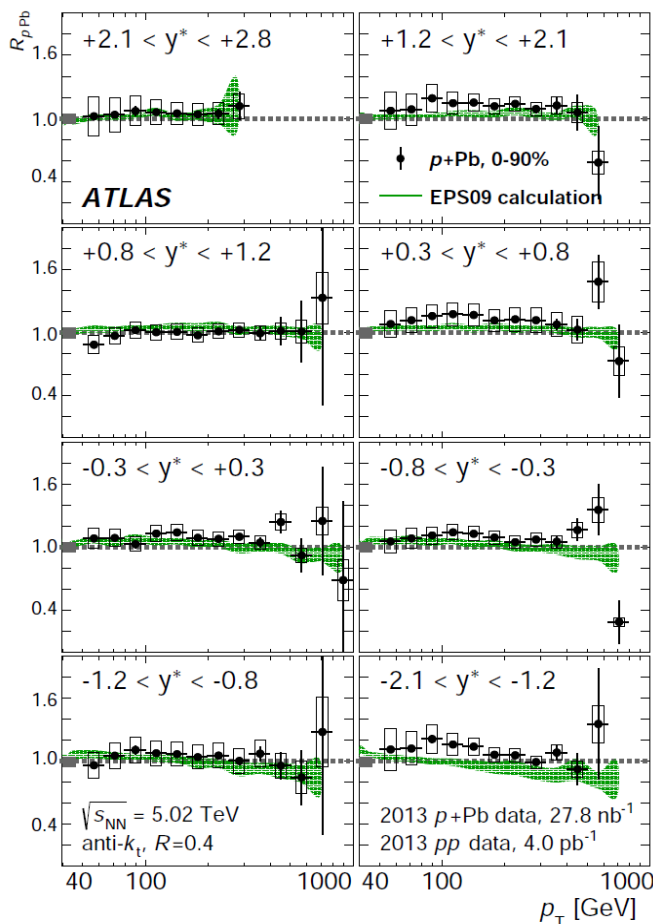

Jet yields and R_{pPb}

[arXiv:1412.4092](https://arxiv.org/abs/1412.4092)

- 0-90% R_{pPb} compared to NLO with EPS09 nPDFs
- R_{pPb} does not differ much from unity if measured inclusively in centrality, **but ...**

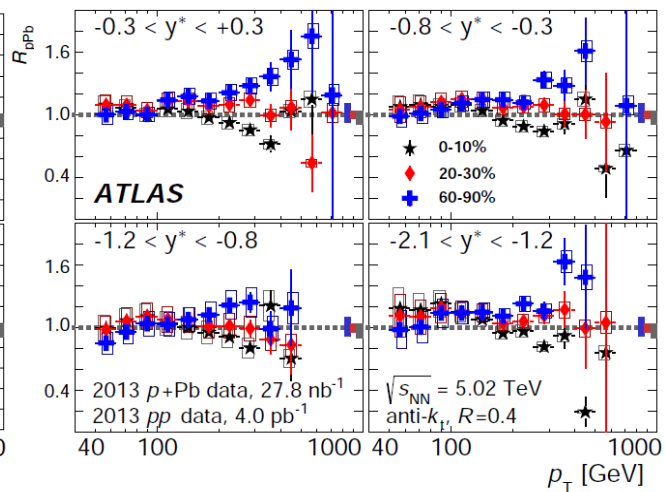

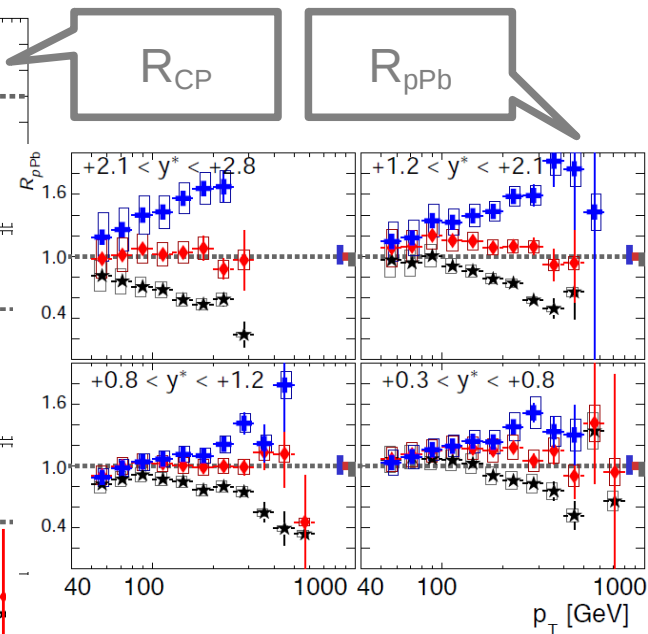

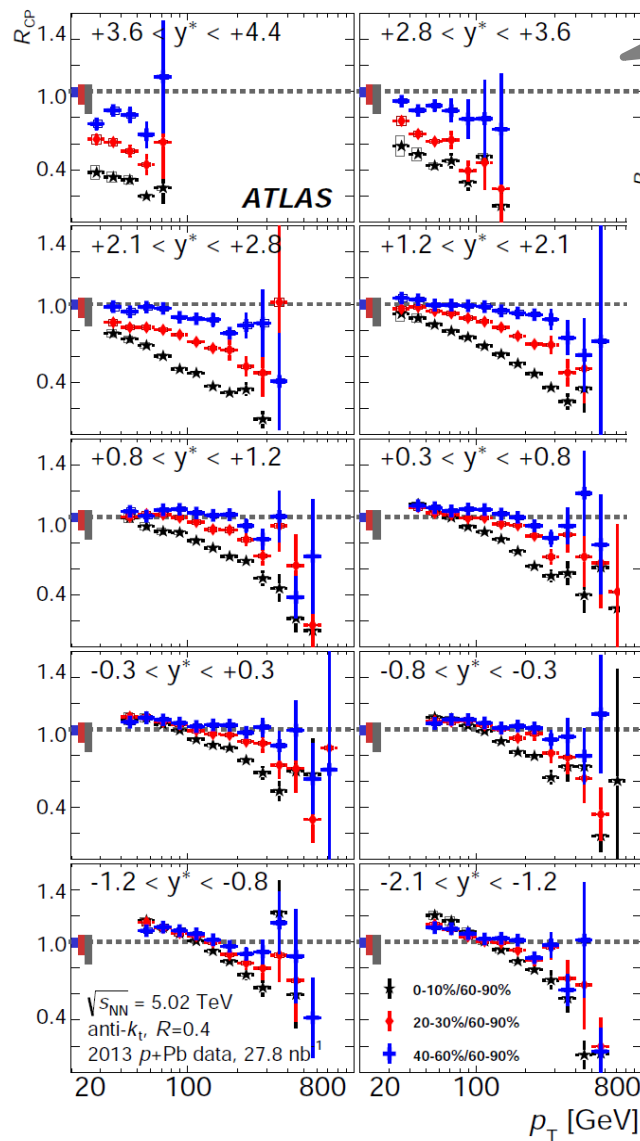

0-90% jet yields

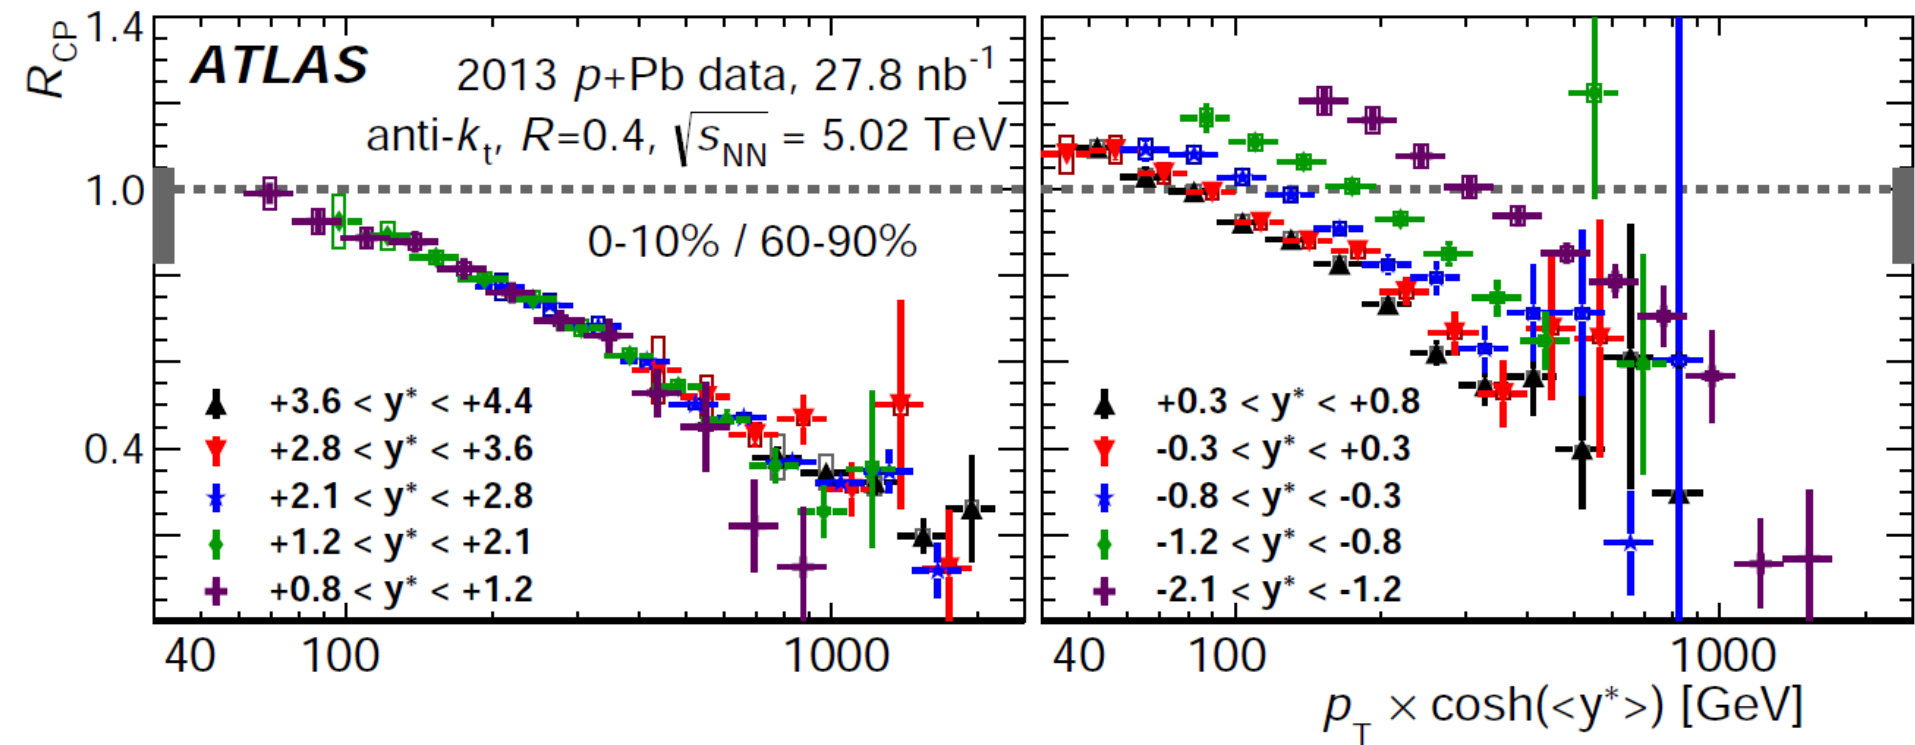

$$R_{pPb} \equiv \frac{1}{T_{pA}} \frac{(1/N_{evt}) \frac{d^2 N_{jet}}{dp_T dy^*}}{d^2 \sigma_{jet}^{pp} / dp_T dy^*}$$

Jet R_{pPb} and R_{CP}

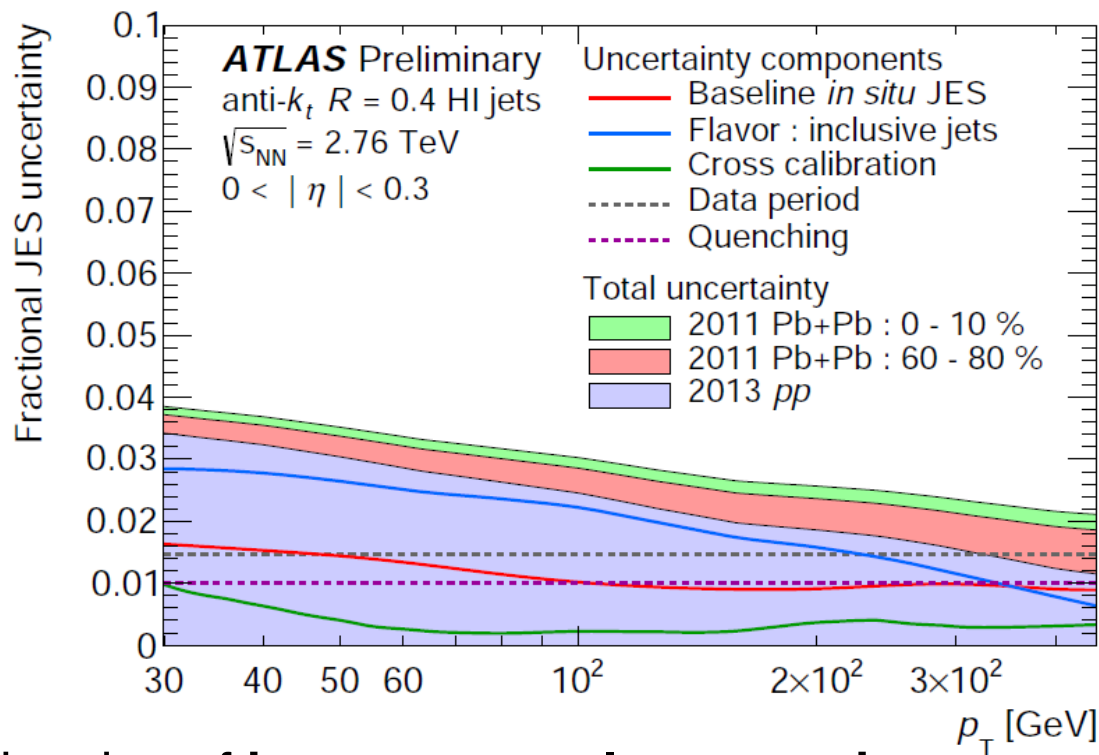

- R_{CP} strongly varies with centrality exhibiting decrease with increasing p_T in all three centrality bins.
- If R_{pPb} is unity and R_{CP} decreases then there must be **enhancement in peripheral collisions** wrt to pp. Indeed, this is observed.
- The use of Glauber-Gribov only amplifies these effects.

Jet R_{pPb} and R_{CP}

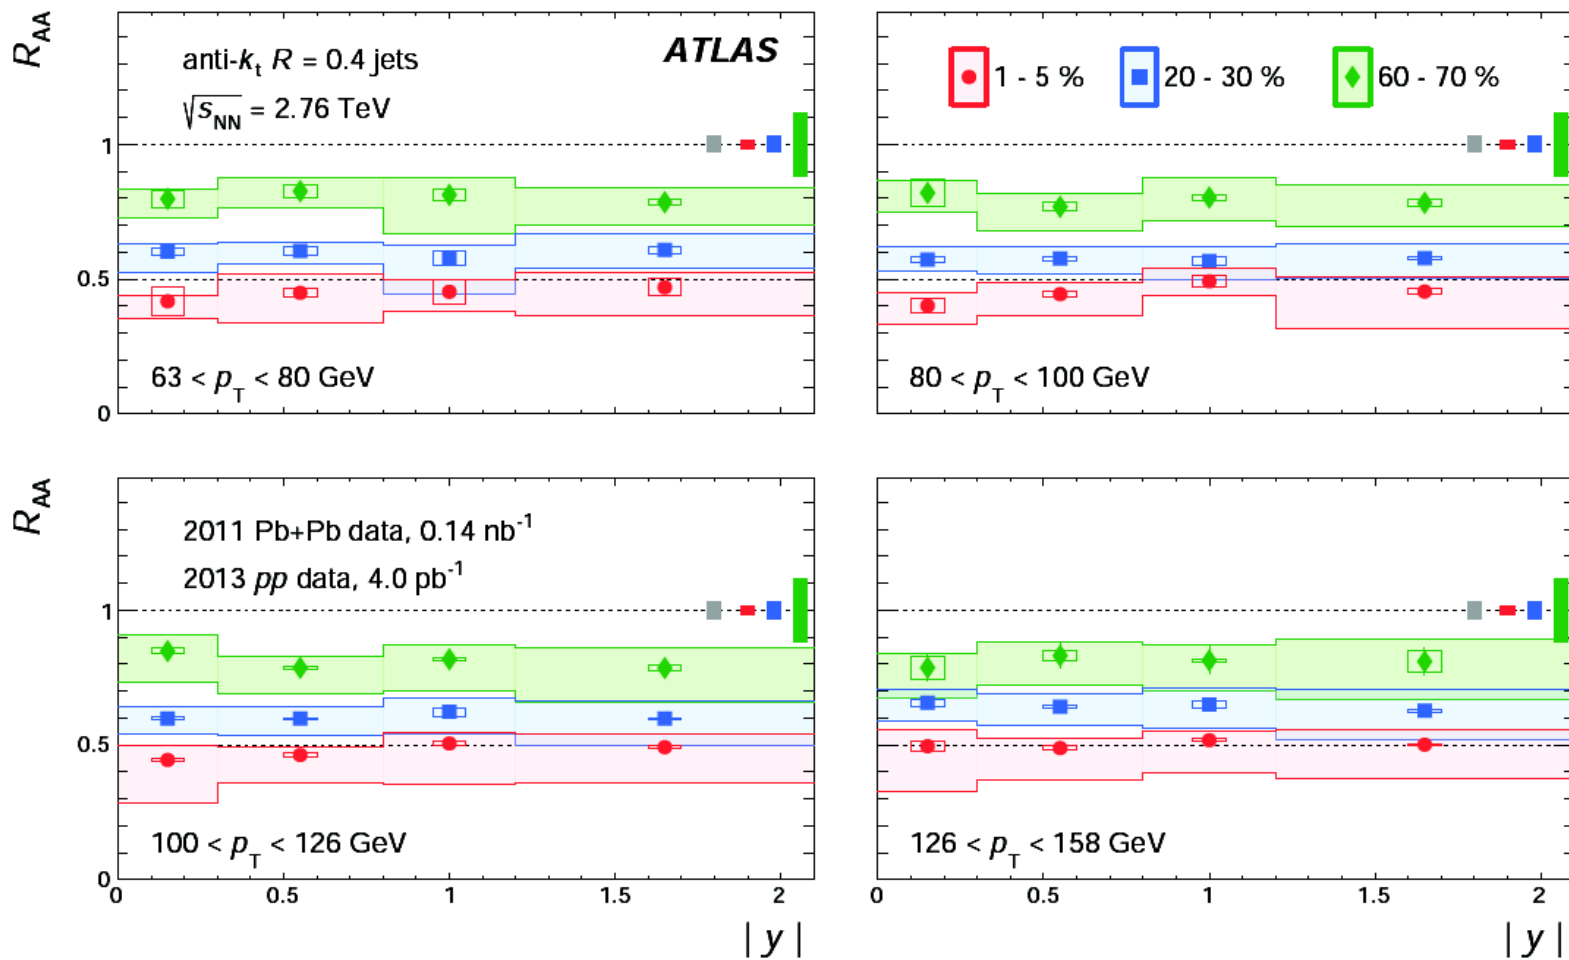

Inclusive jet suppression

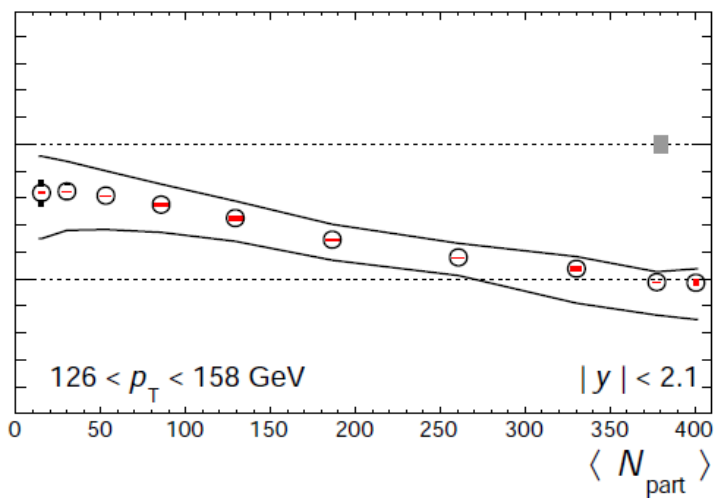

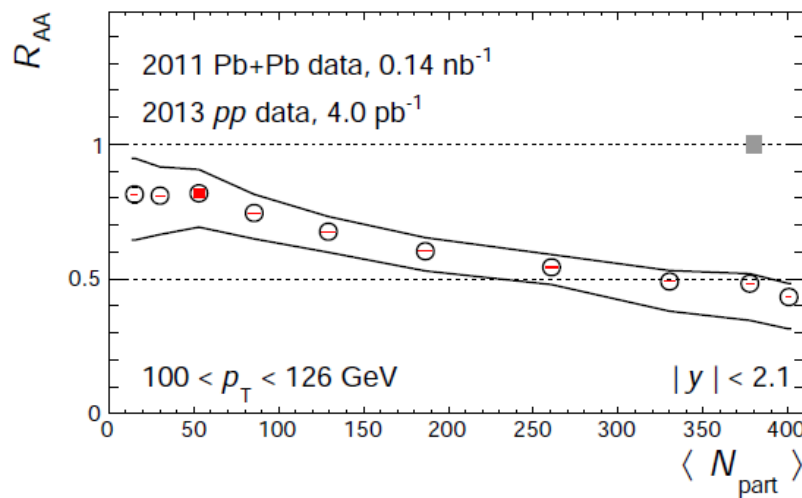

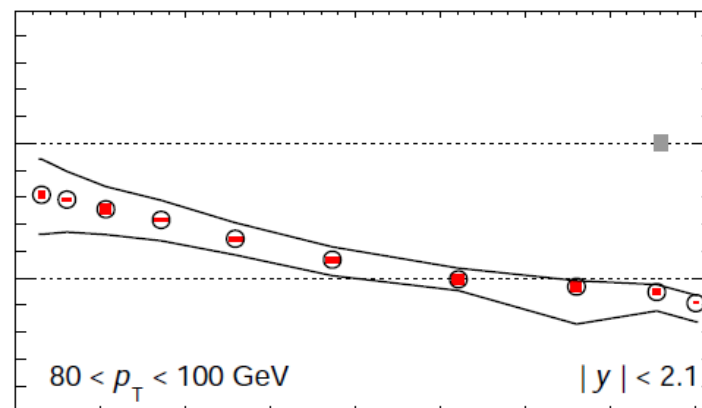

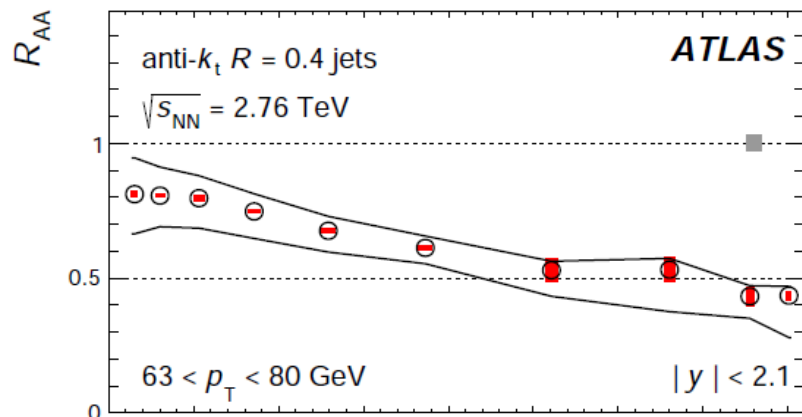

- Detailed estimation of **jet energy scale uncertainty**.
- Using ***in situ*** techniques (γ +jet and Z+jet) and limits on the impact of modified fragmentation on jet energy scale.
- Same level of **rigor as in precision pQCD** measurement should be a standard for precision HI measurements in the run II.

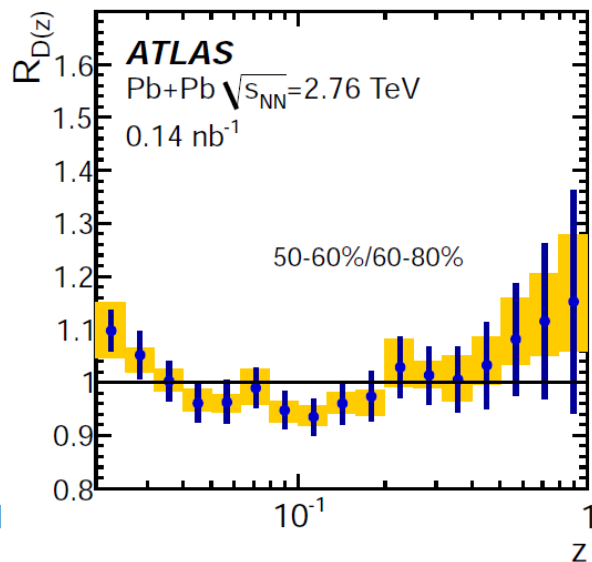

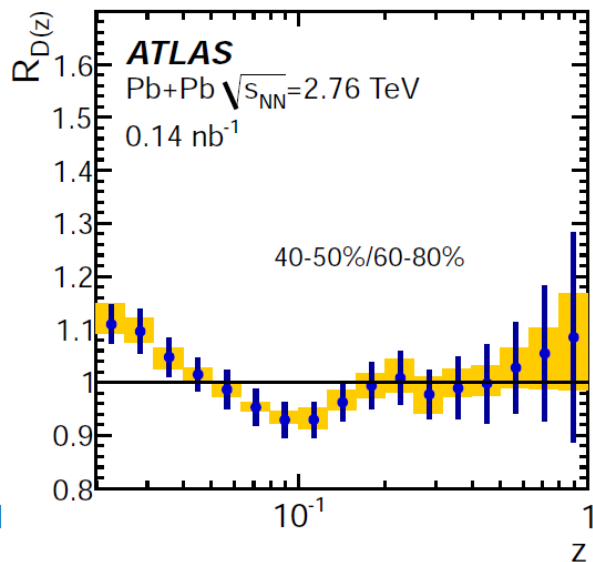

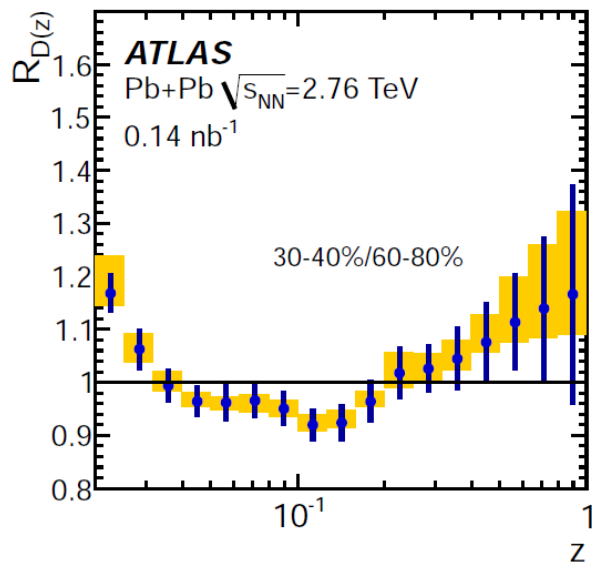

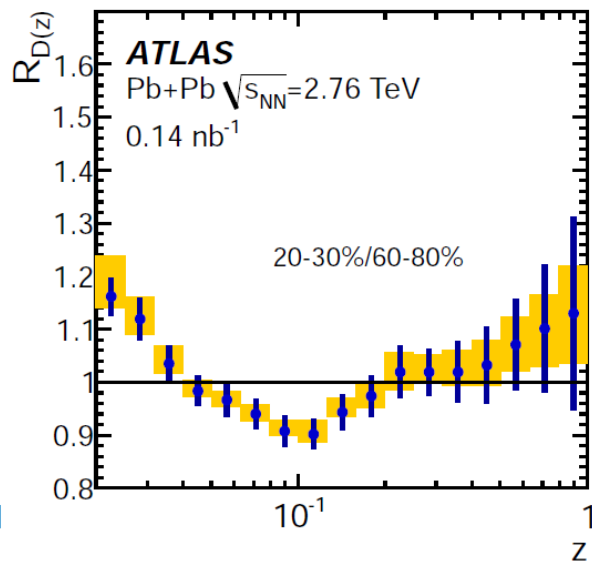

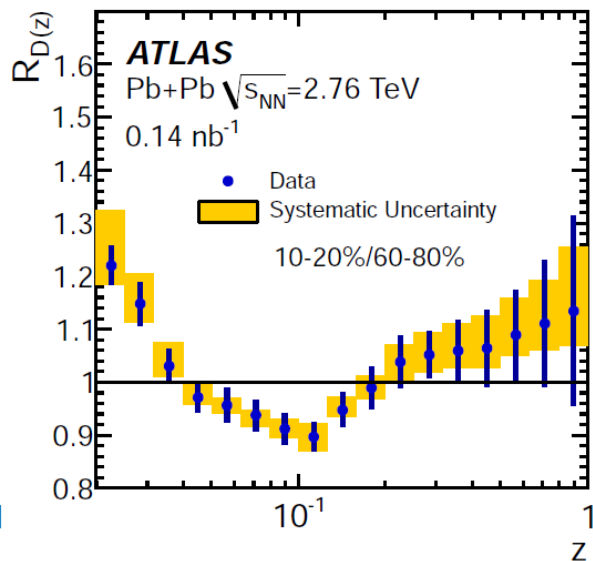

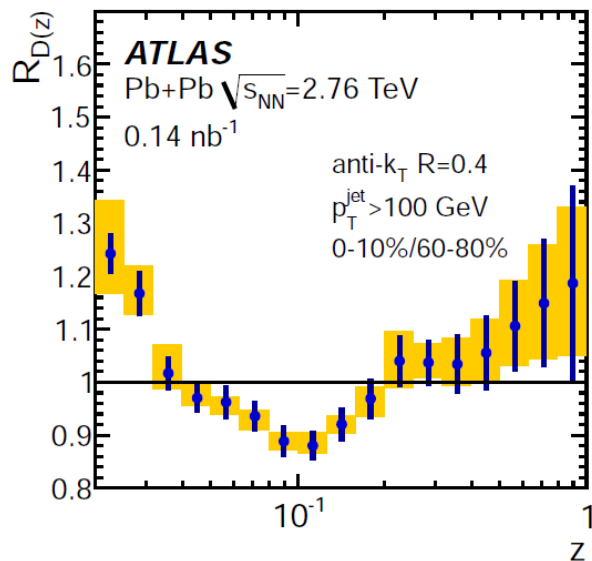

Jet R_{AA}

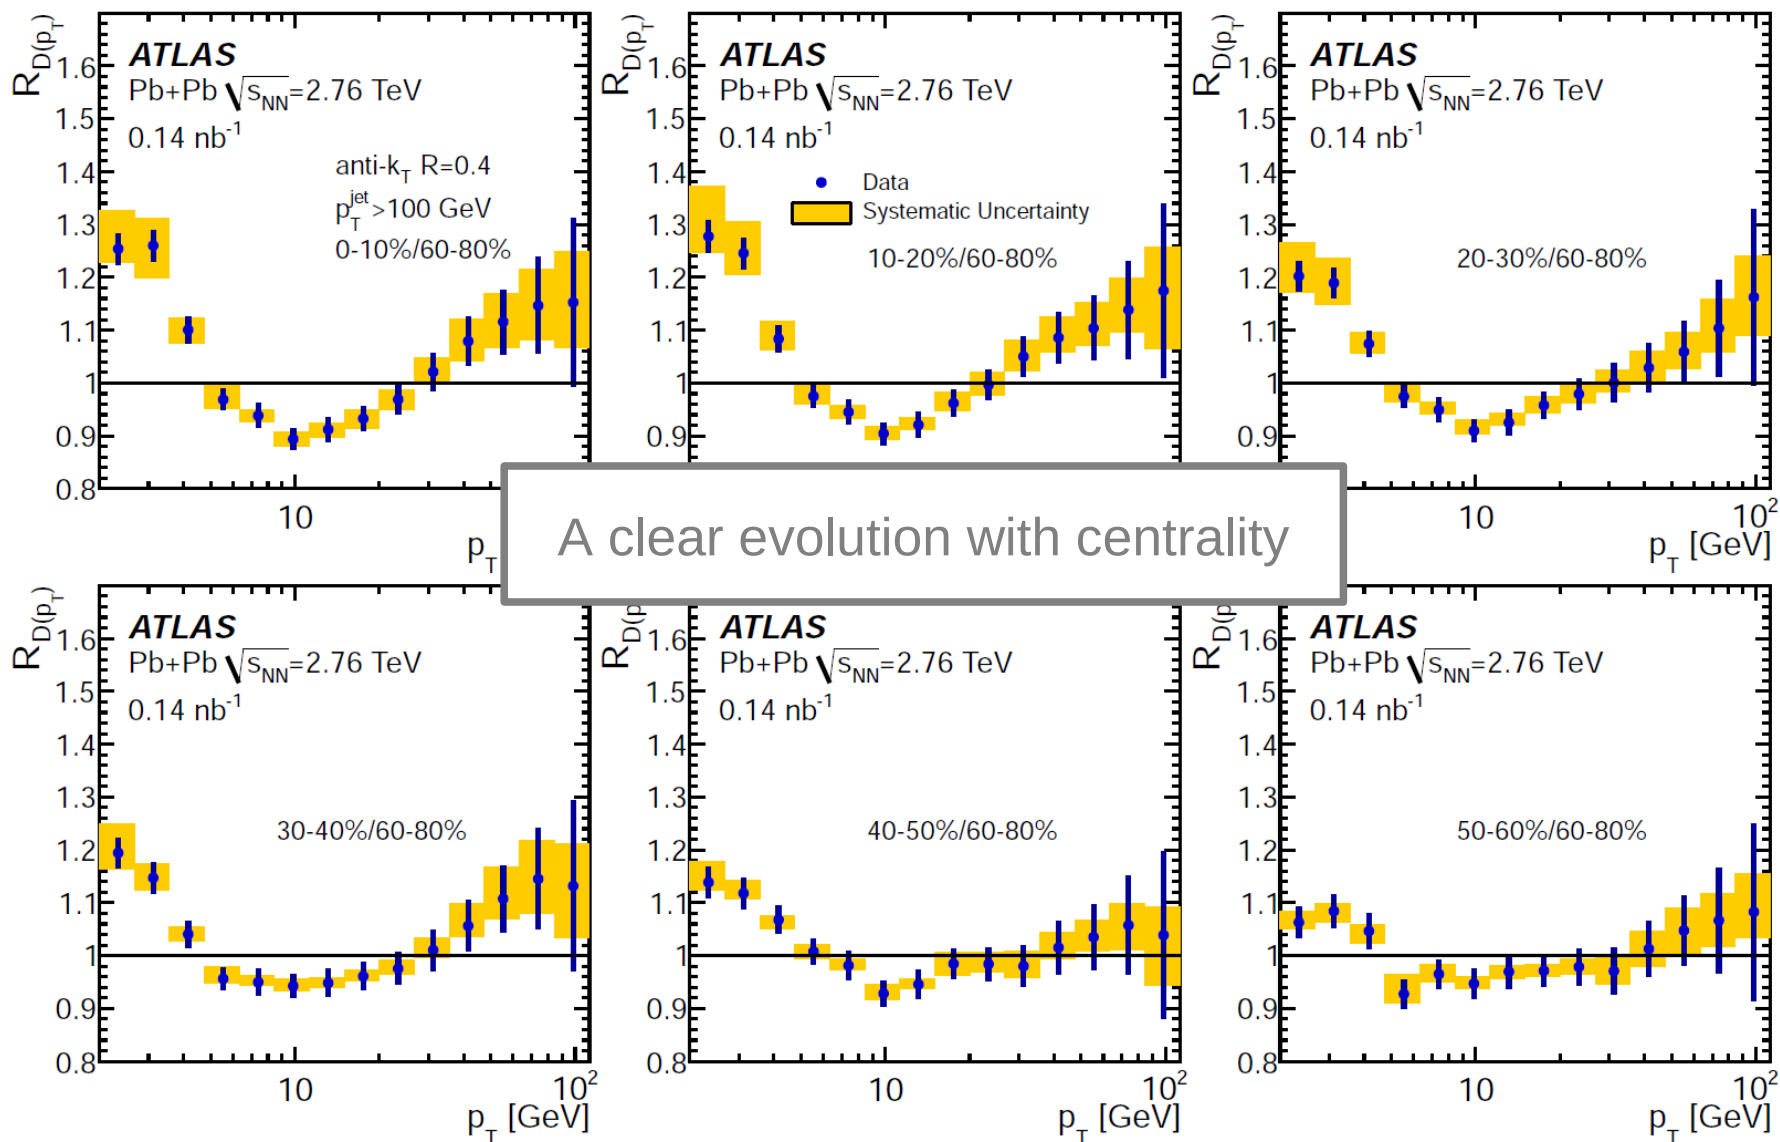

Jet R_{AA}

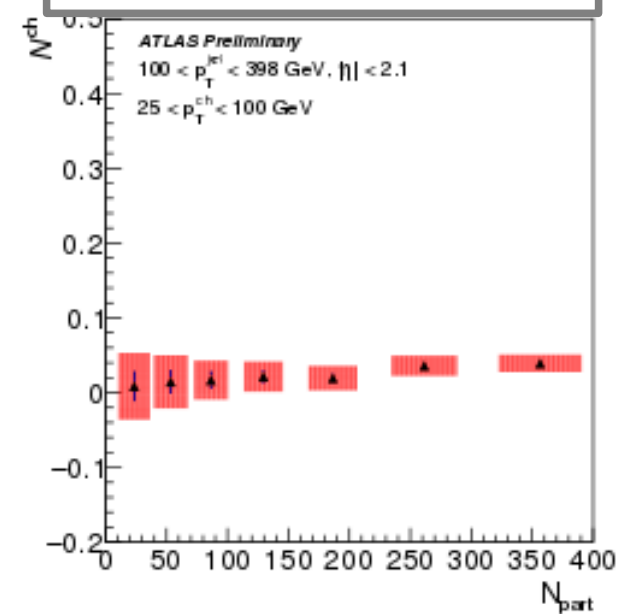

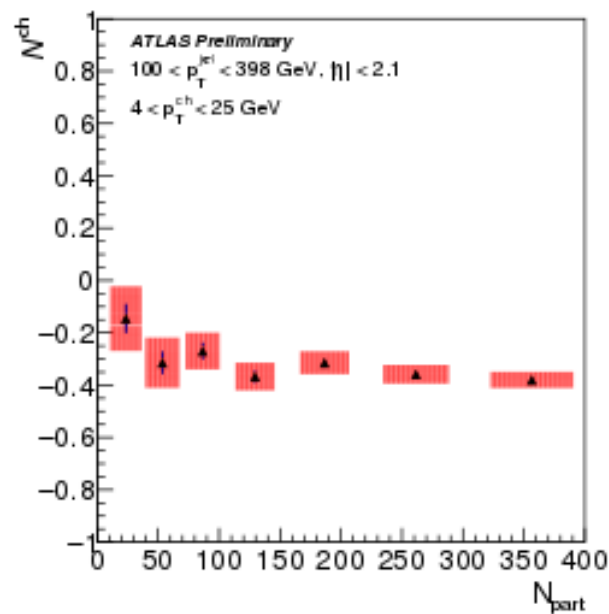

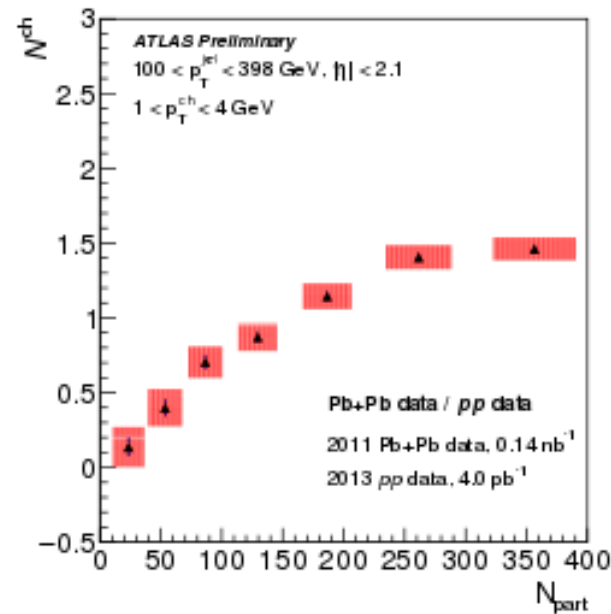

$R_{D(z)}$ in Pb+Pb for $R=0.4$ jets

$R_{D(pt)}$ in Pb+Pb for $R=0.4$ jets

- To quantify the flow of particles:

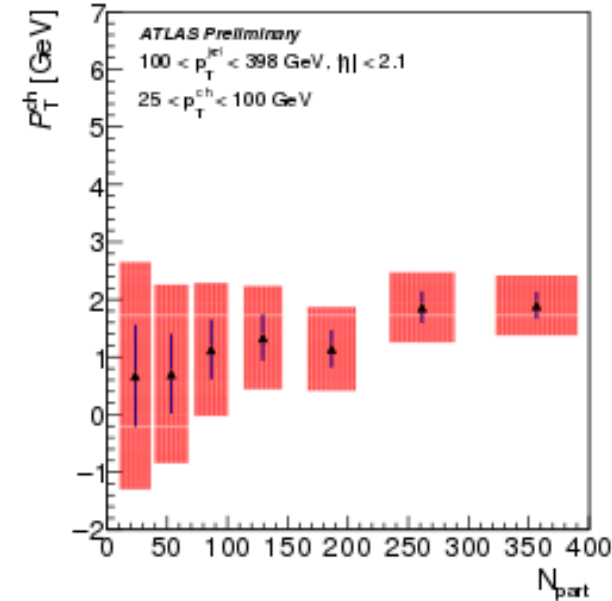

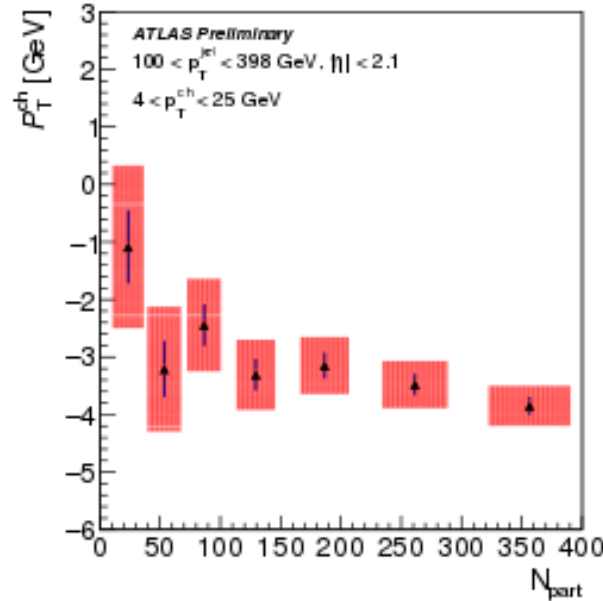

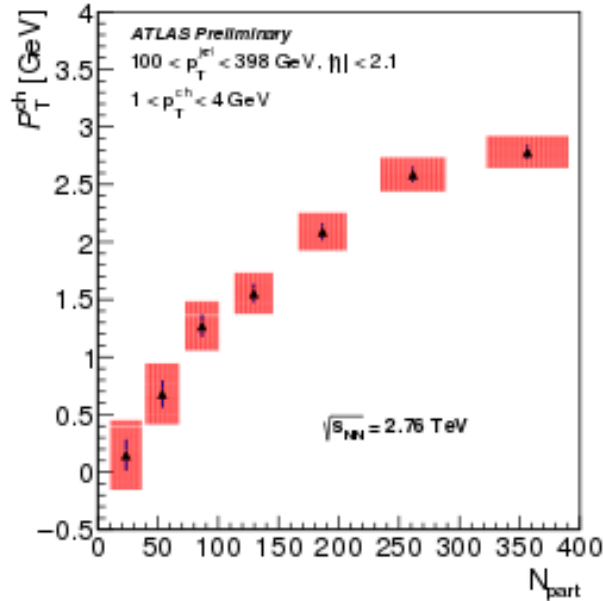

$$N^{\text{ch}} \equiv \int_{p_{T,\text{min}}}^{p_{T,\text{max}}} \left(D(p_T)|_{\text{cent}} - D(p_T)|_{\text{pp}} \right) dp_T$$

... as a function of N_{part}

Tells us how many extra/missing particles is present in a given p_T range

Jet fragmentation – flow of energy

EPJC 77 (2017) no.6, 379

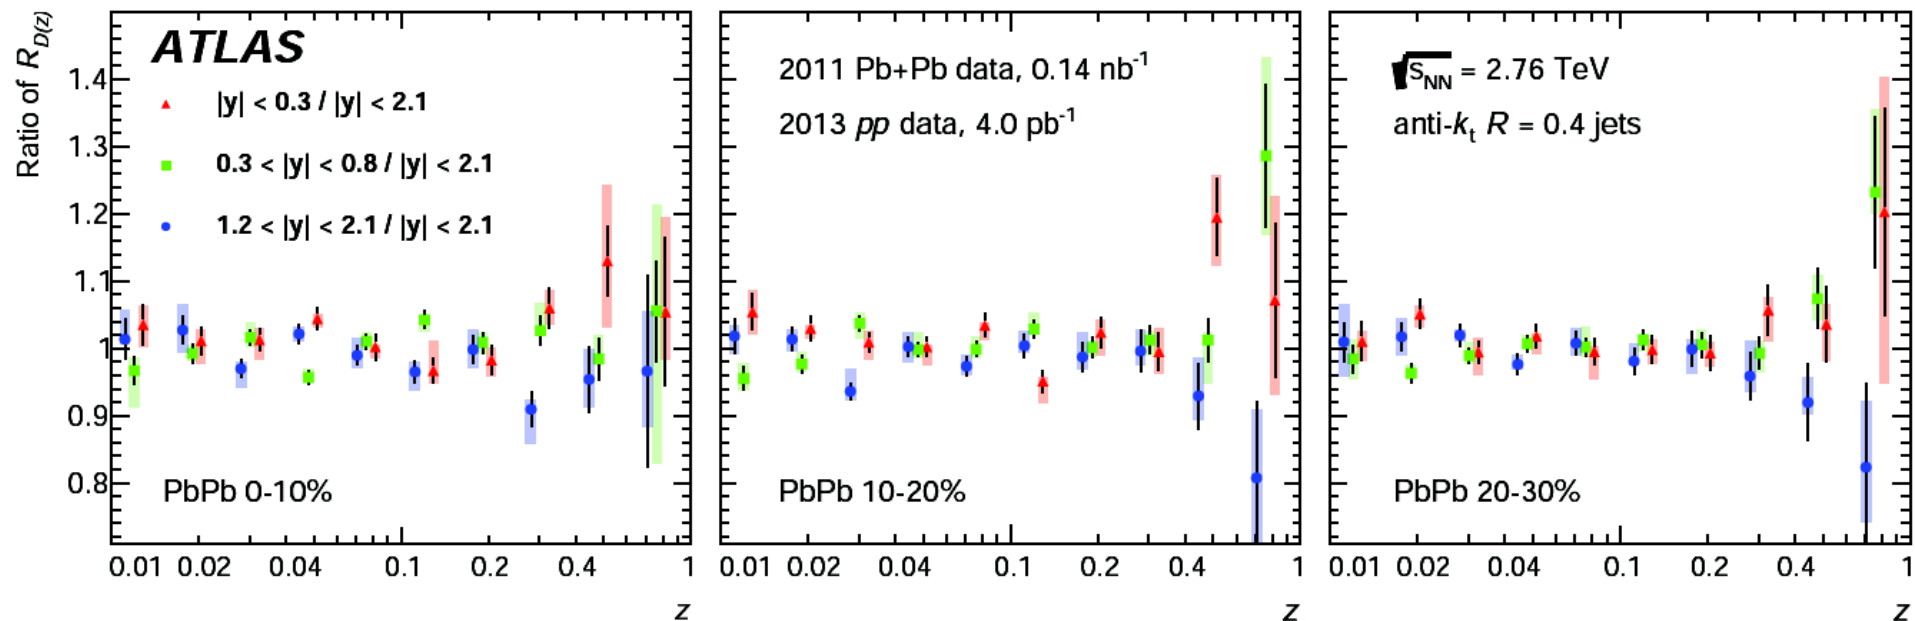

- To quantify the flow of momentum:

$$P_T^{\text{ch}} \equiv \int_{p_{T,\text{min}}}^{p_{T,\text{max}}} \left(D(p_T)|_{\text{cent}} - D(p_T)|_{\text{pp}} \right) p_T dp_T$$

... as a function of N_{part}

Tells us how much p_T is carried by extra/missing particles in a given p_T range

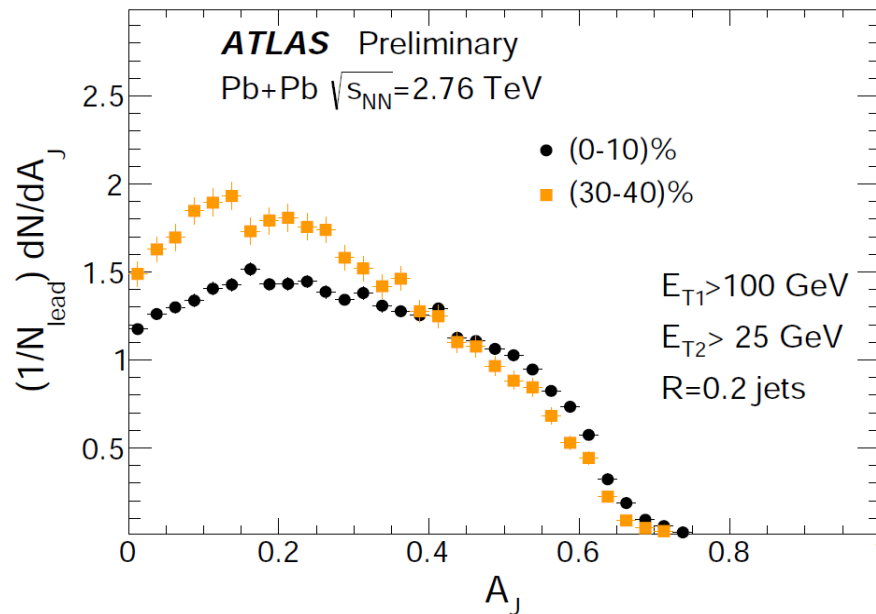

Sign of a larger enhancement at high z in the mid-rapidity region as compared to the forward rapidity region (explanation for this proposed in [arXiv:1504.05169](https://arxiv.org/abs/1504.05169)).

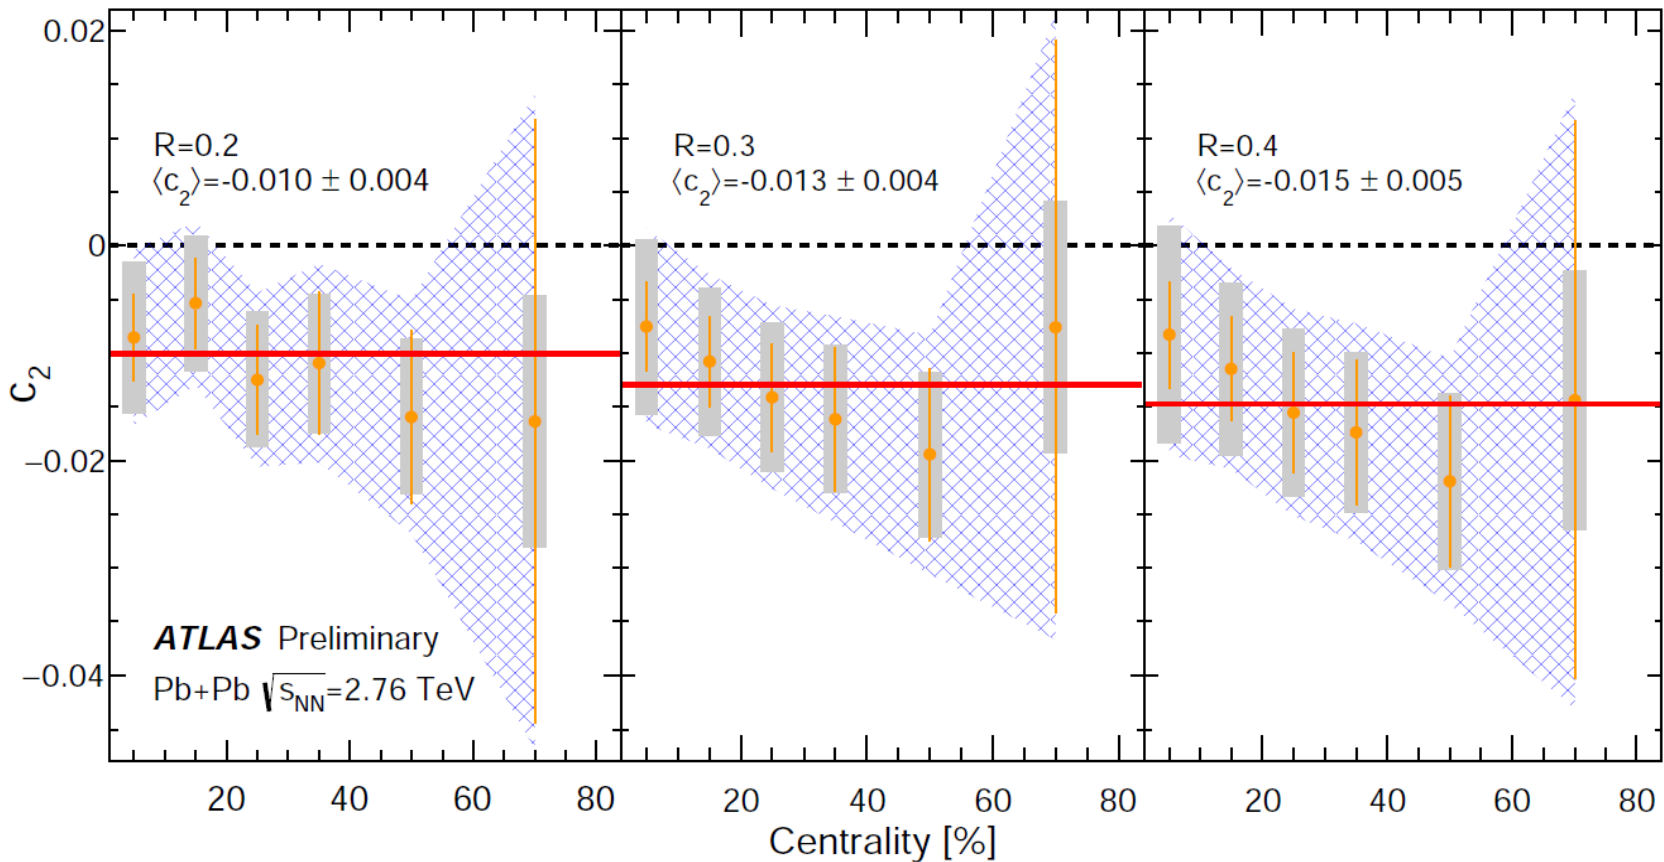

Jet event shape correlations

- Study the dependence of the dijet asymmetry on the **angle between the leading jet and second order event plane** => help constraining the **path length dependence** of the jet quenching.
- Evaluating second Fourier coefficient of mean A_J :

$$\langle A_J \rangle(\phi^{\text{Lead}} - \Psi_2) = A_J^0 \left(1 + 2c_2^{\text{obs}} \cos(2 \times |\phi^{\text{Lead}} - \Psi_2|) \right)$$

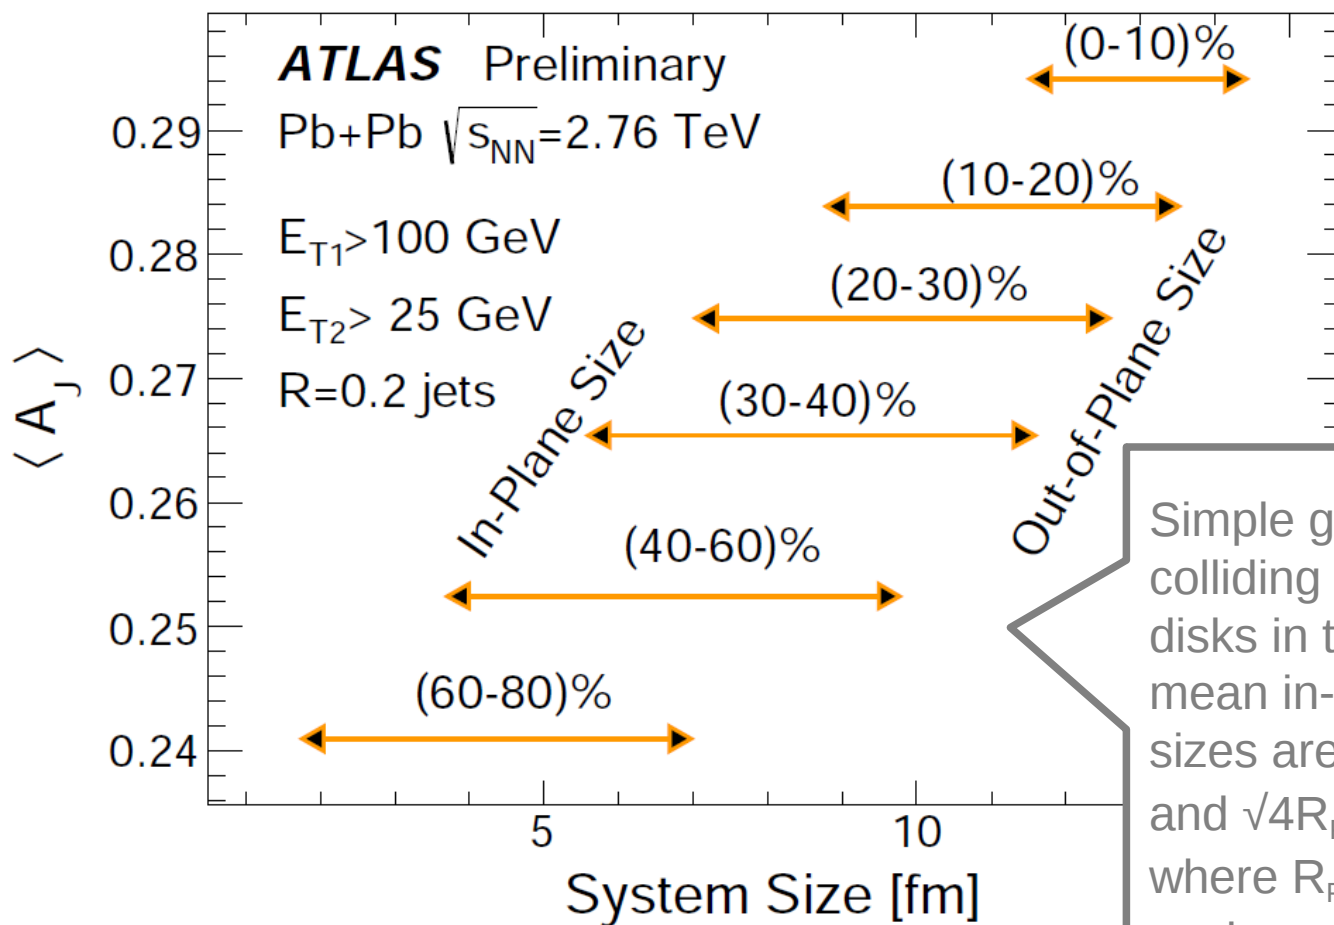

Jet event shape correlations

$$c_2 = \frac{c_2^{\text{obs}}}{\text{Res}\{2\Psi_2\}}$$

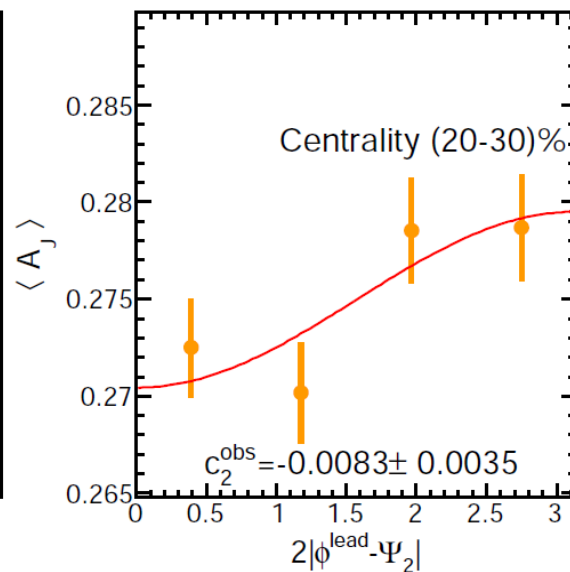

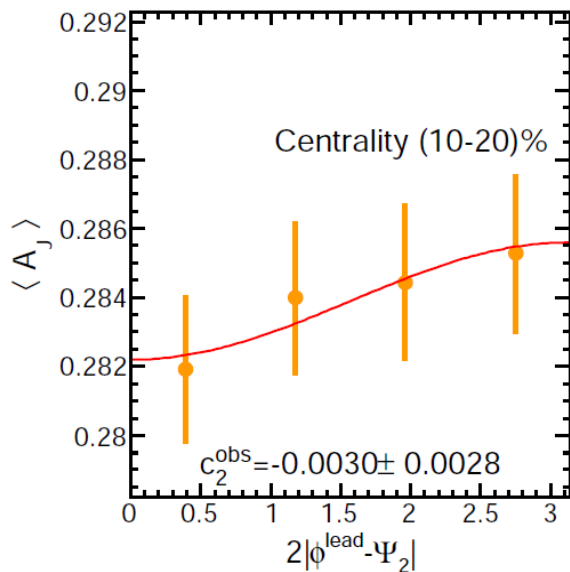

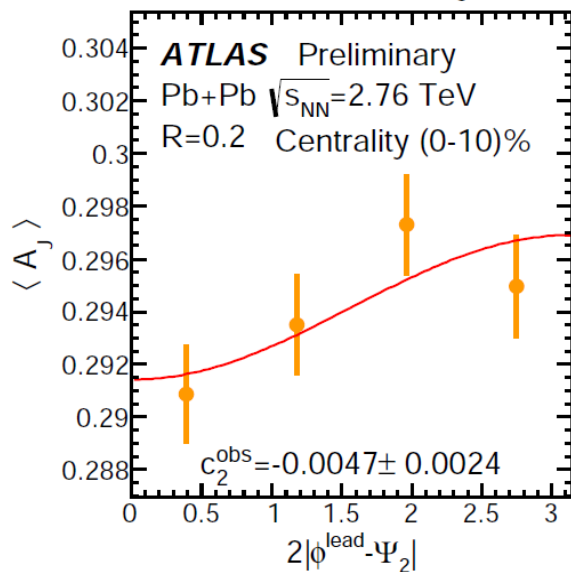

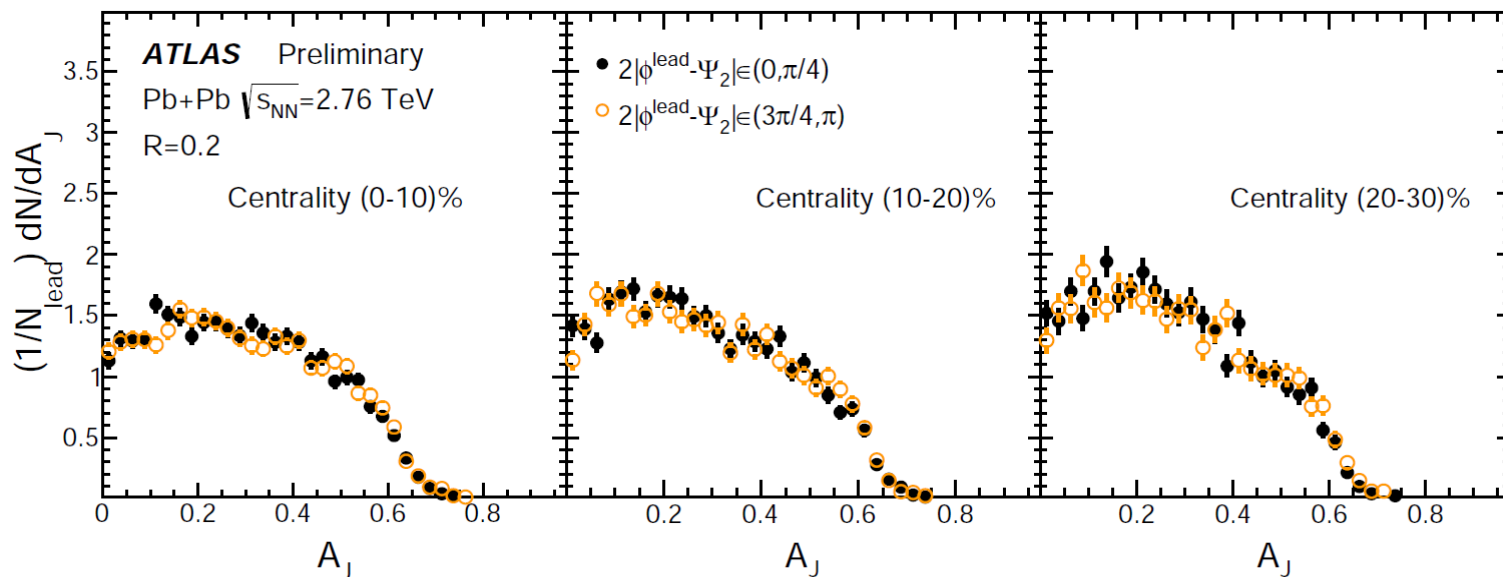

c_2 **small (<2%), negative** indicating slightly larger A_J for leading jets oriented out-of-plane than for jets oriented in-plane.

Jet and event shape correlations, system size from a simple model

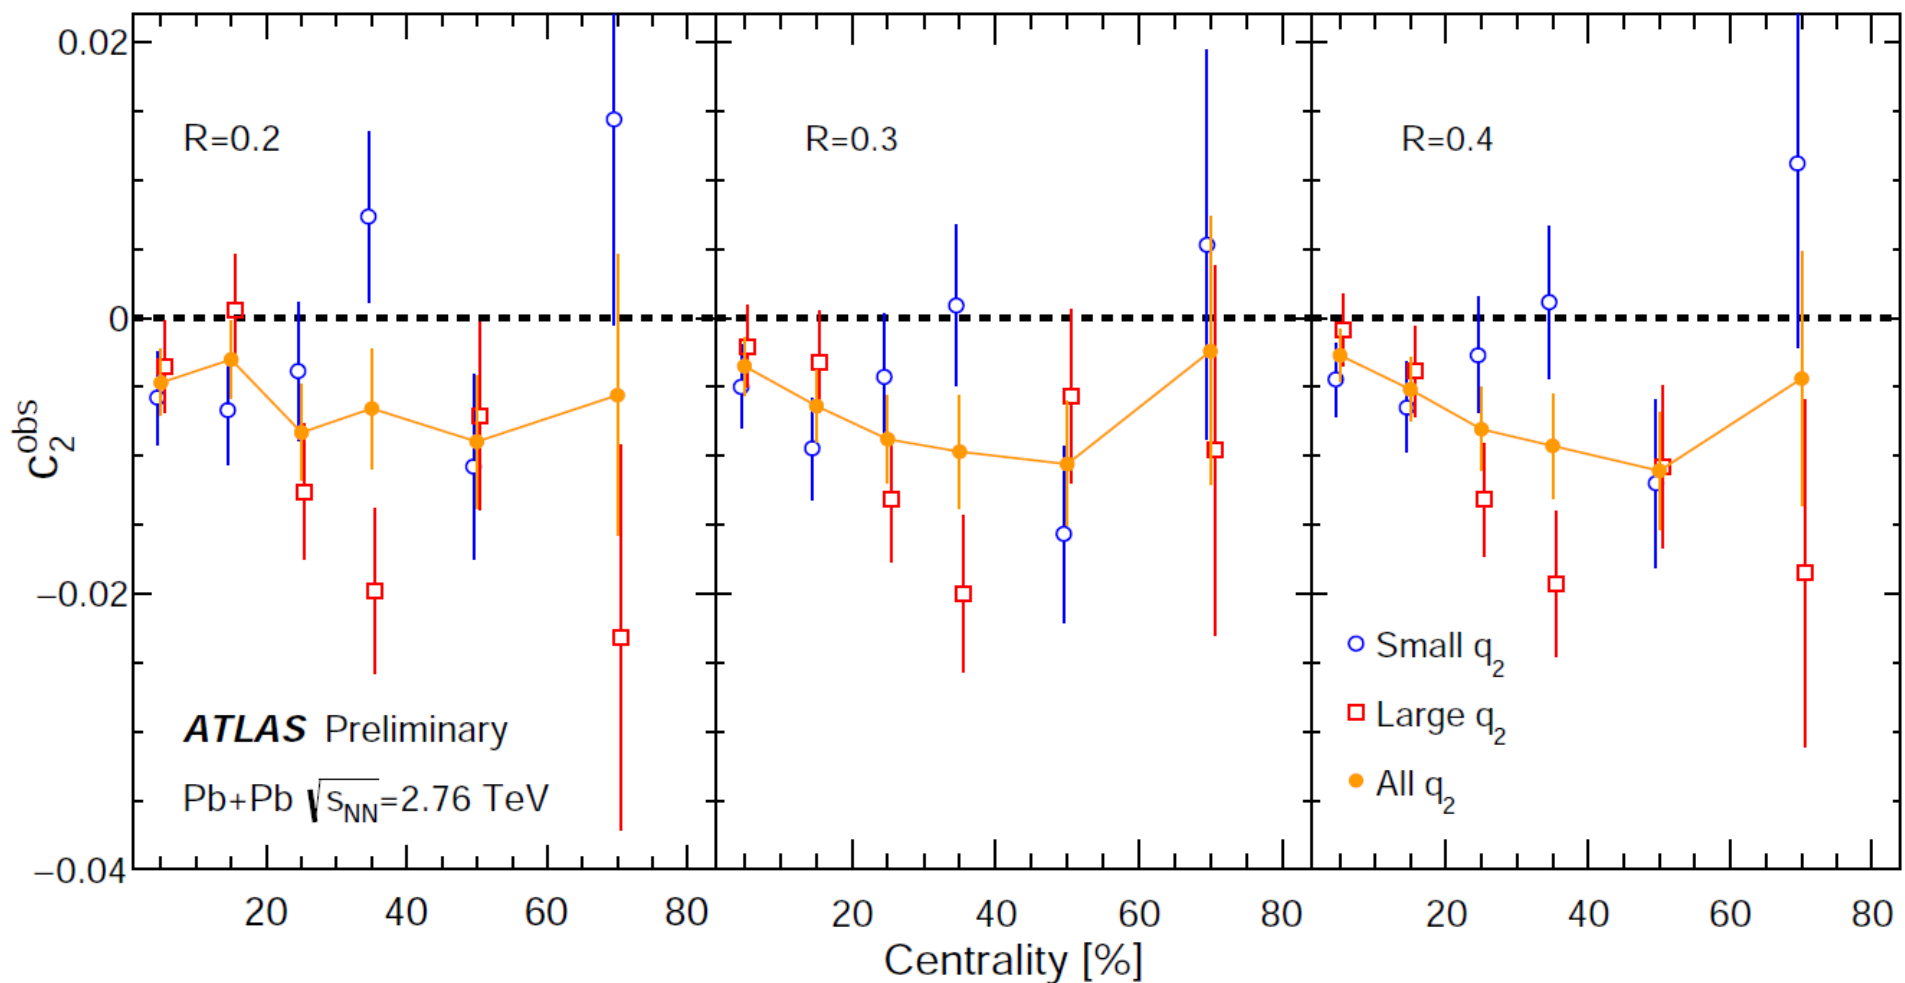

Simple geometric picture: The colliding nucleons are treated as disks in the transverse plane. The mean in-plane and out-of plane sizes are obtained as $2R_{Pb}-\langle b_{imp} \rangle$ and $\sqrt{4R_{Pb}^2-\langle b_{imp} \rangle^2}$ respectively, where R_{Pb} is the radius of the Pb nucleus (7.4 fm) and $\langle b_{imp} \rangle$ is the mean impact parameter for the given centrality interval.

Jet and event shape correlations

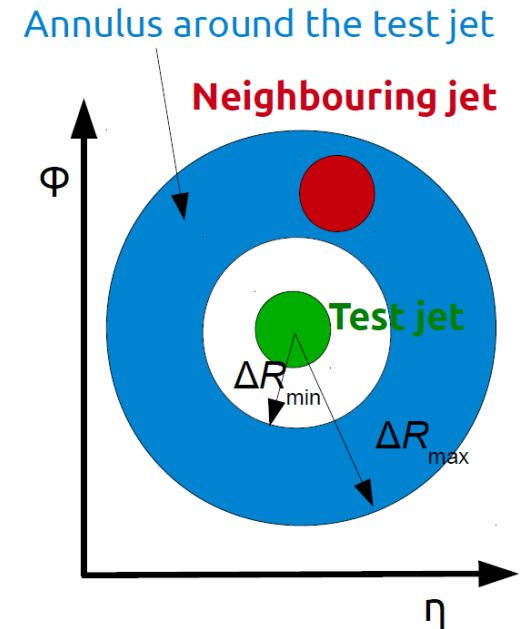

Jet and event shape correlations, c_2 differentially in q_2

- Neighboring jet production quantified using quantity previously measured at Tevatron

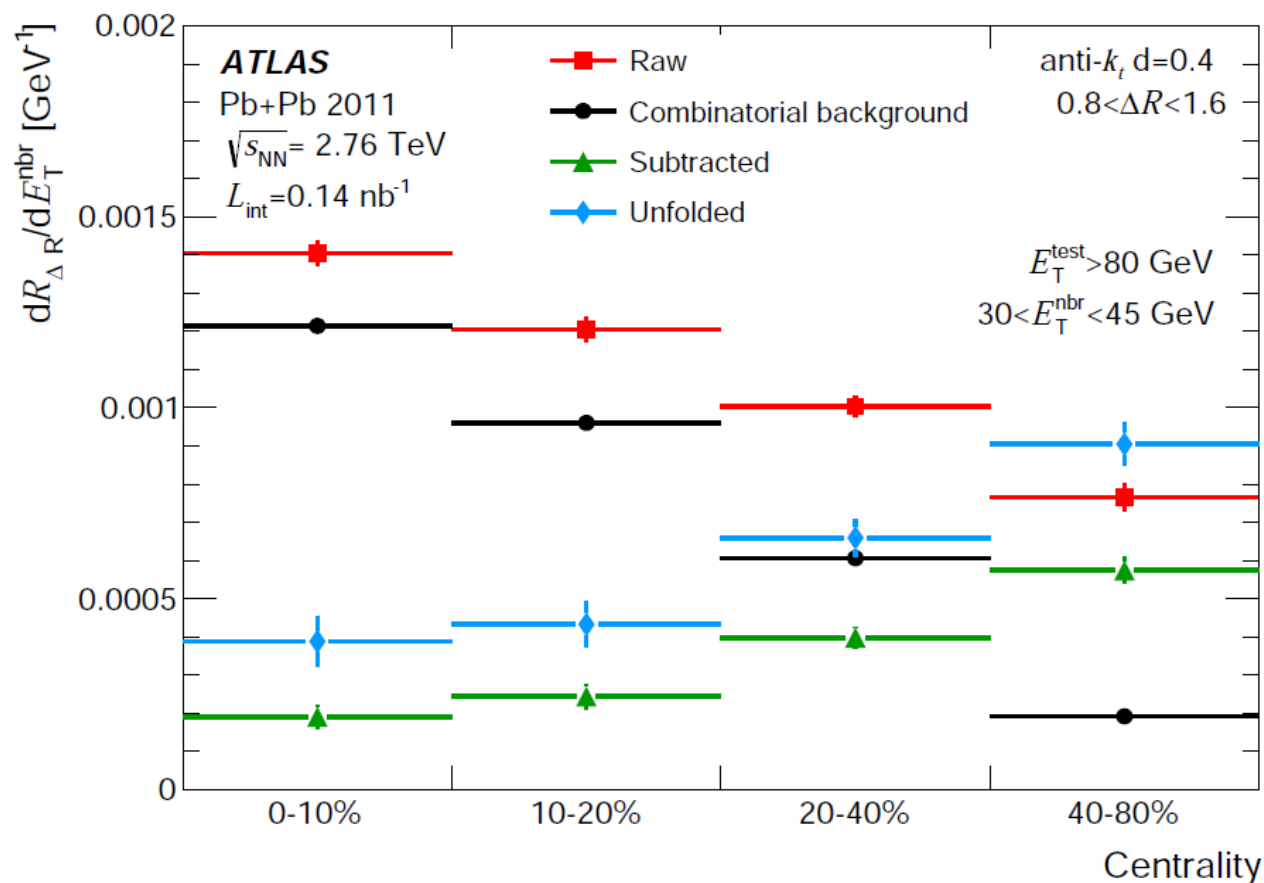

$$R_{\Delta R} = \frac{1}{dN_{\text{jet}}^{\text{test}}/dE_T^{\text{test}}} \sum_{i=1}^{N_{\text{jet}}^{\text{test}}} \frac{dN_{\text{jet},i}^{\text{nbr}}}{dE_T^{\text{test}}} (E_T^{\text{test}}, E_{T,\text{min}}^{\text{nbr}}, \Delta R)$$

... the rate of **neighboring jets that accompany** a given **test jet**.

- To quantify the centrality dependence the central-to-peripheral ratios, $\rho(R_{\Delta R})$, also evaluated.

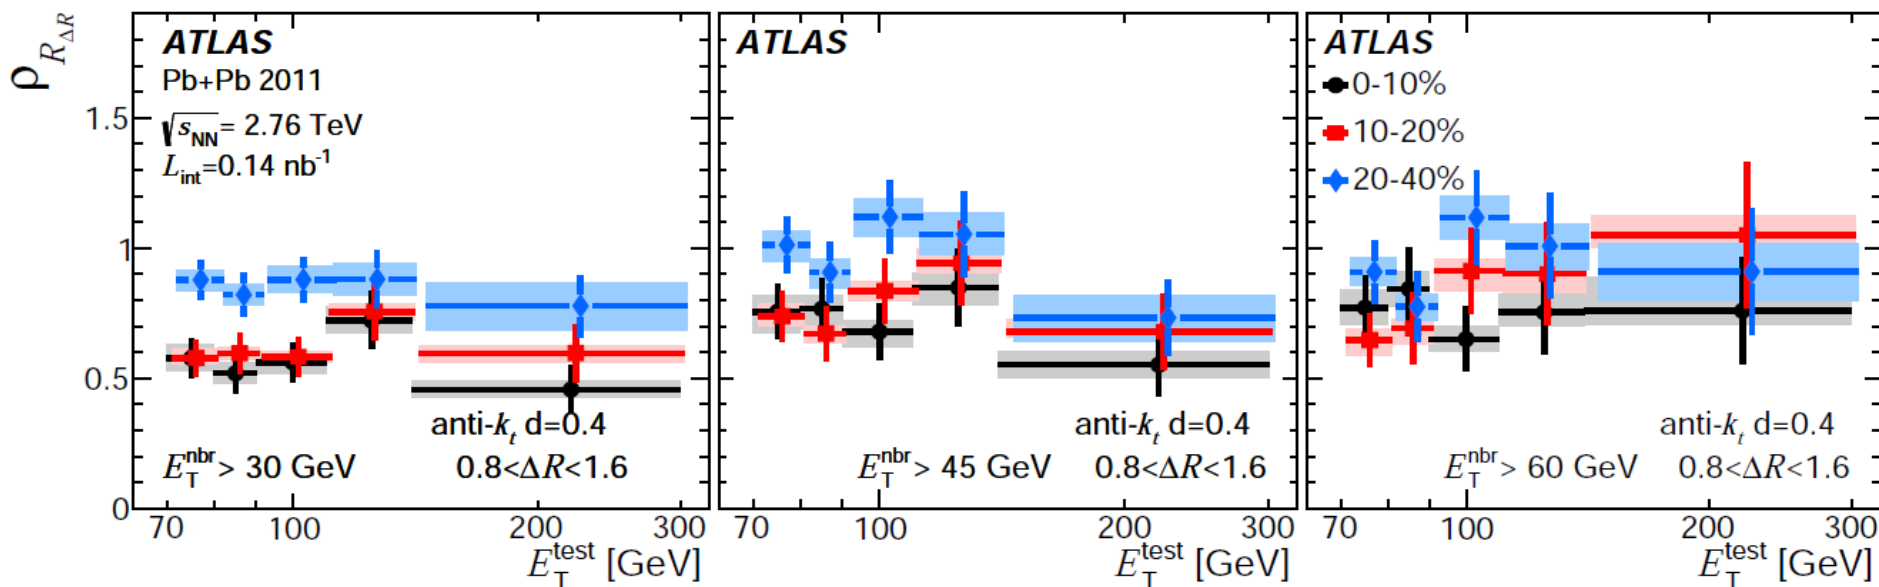

Correction flow for neighboring jet yields

Example of the
correction flow for
the most “difficult”
case of lowest E_T
bins

$$\text{Unfolded} = k * (\text{Raw} - \text{Combinatorics})$$

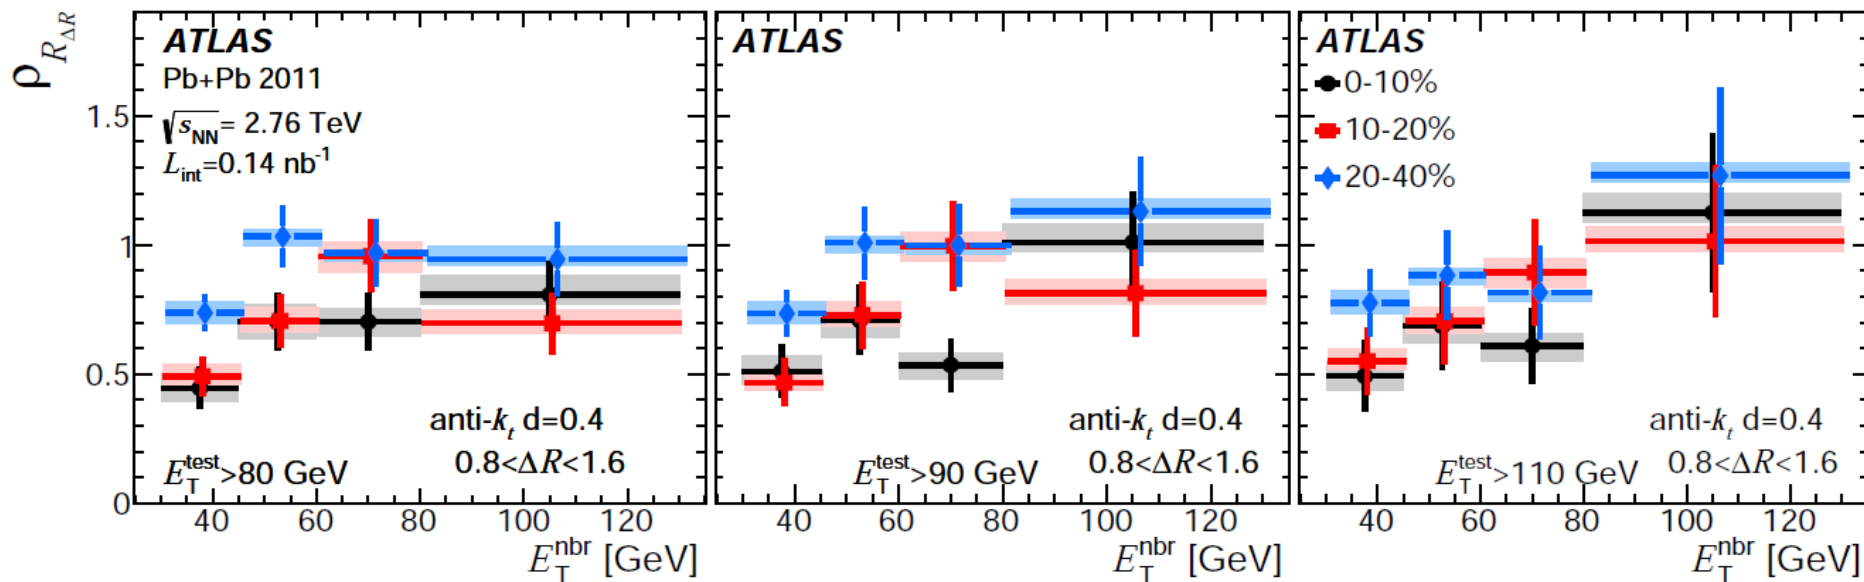

Central-to-peripheral ratios

Central to peripheral ratio of $R_{\Delta R}$ as a function of test jet E_T .

- suppression factor of about 0.5
 - suppression rather flat with E_T
- } similar trends as in the inclusive jet R_{CP}

Central-to-peripheral ratios

Central to peripheral ratio of $R_{\Delta R}$ as a function of neighboring jet E_T .

Decrease of suppression with increasing jet E_T ... may be expected for the configuration of magnitude of neighboring jet E_T approaching the magnitude of test jet E_T (the per-test jet normalization in the $R_{\Delta R}$ effectively removes the suppression).
