

Latest CMS results on Higgs boson production in association with top quarks ($t\bar{t}H$)

Saranya Ghosh
(DPhP, IRFU, CEA Paris-Saclay),

For the CMS collaboration

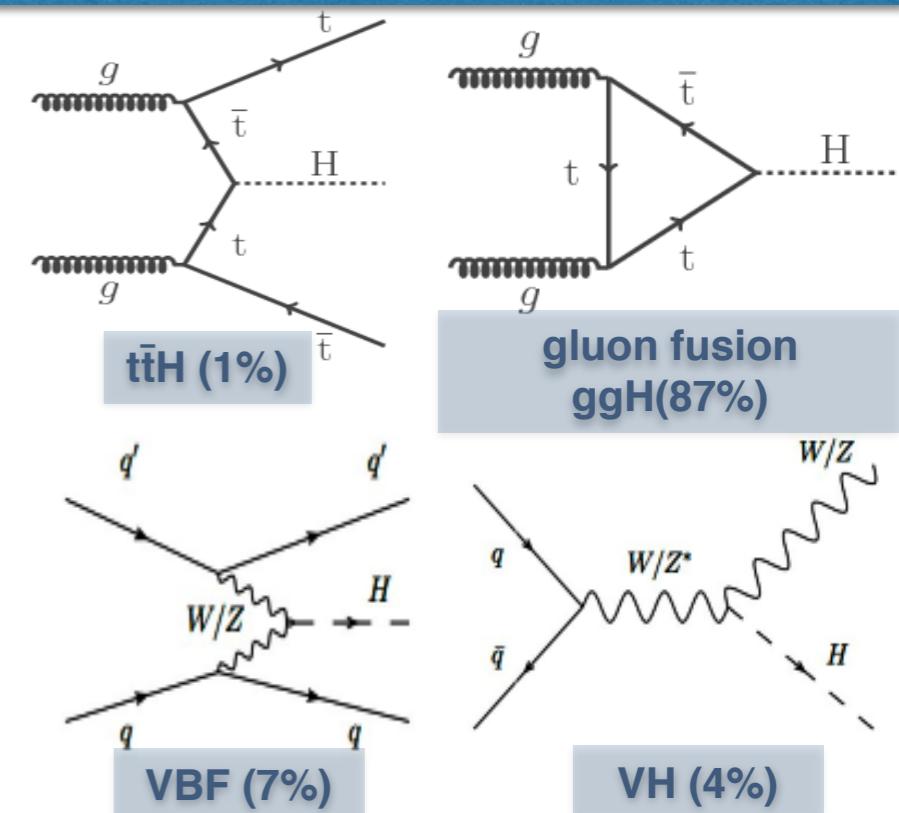

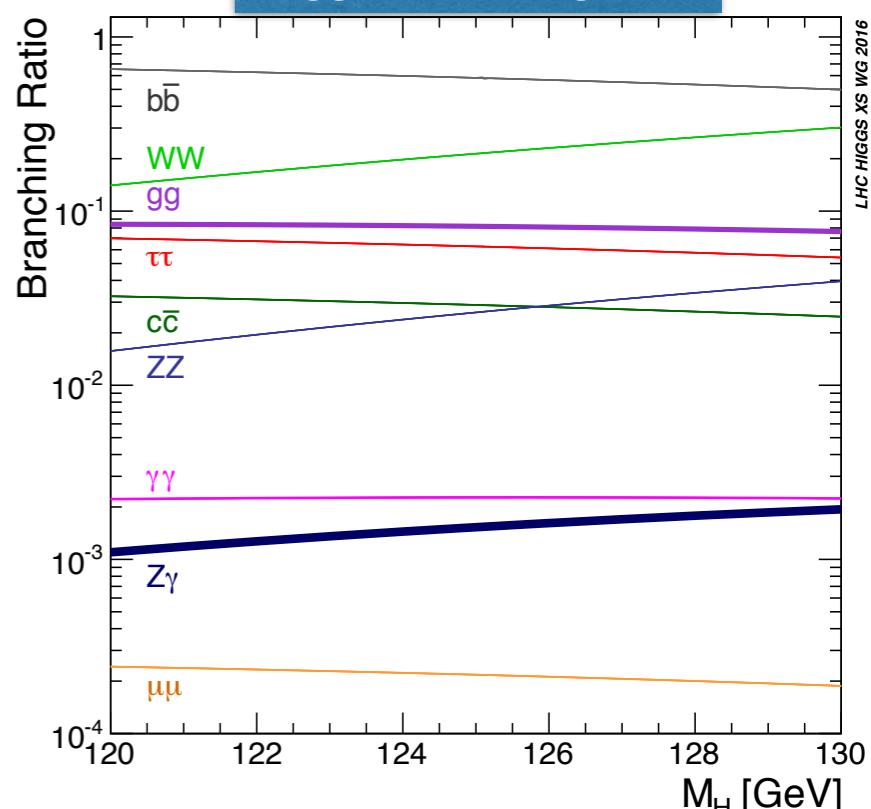

INTRODUCTION

- Production of the Higgs boson in association with a pair of top quarks ($t\bar{t}H$) probes the **top quark Yukawa coupling**
 - Direct handle on the **$t\bar{t}H$ vertex at tree level** : gluon fusion involves a loop
 - Cross-section of $t\bar{t}H$ is **$\sim 508 \text{ fb}$ at 13 TeV** , roughly **4 times** the value at 8 TeV , increased potential for discovery
- Searches for **$t\bar{t}H$ at CMS** in Run 2 : based on decay channel of the Higgs
 - **Multi-leptonic ($H \rightarrow ZZ^*$, $H \rightarrow WW^*$, $H \rightarrow \tau\tau$)** : higher rate, multi-lepton final state with low background
 - **τ_H ($H \rightarrow \tau\tau$, also $H \rightarrow ZZ^*$, $H \rightarrow WW^*$)**: One τ decaying hadronically, significant ‘fake’ background
 - **$H \rightarrow \gamma\gamma$** : small branching ratio, but clean final state (low systematic uncertainties). Excellent diphoton mass resolution
 - **$H \rightarrow b\bar{b}$** : high branching ratio, but complex multi-jet final state

Major Higgs production modes at LHC (13 TeV)

Higgs branching ratio

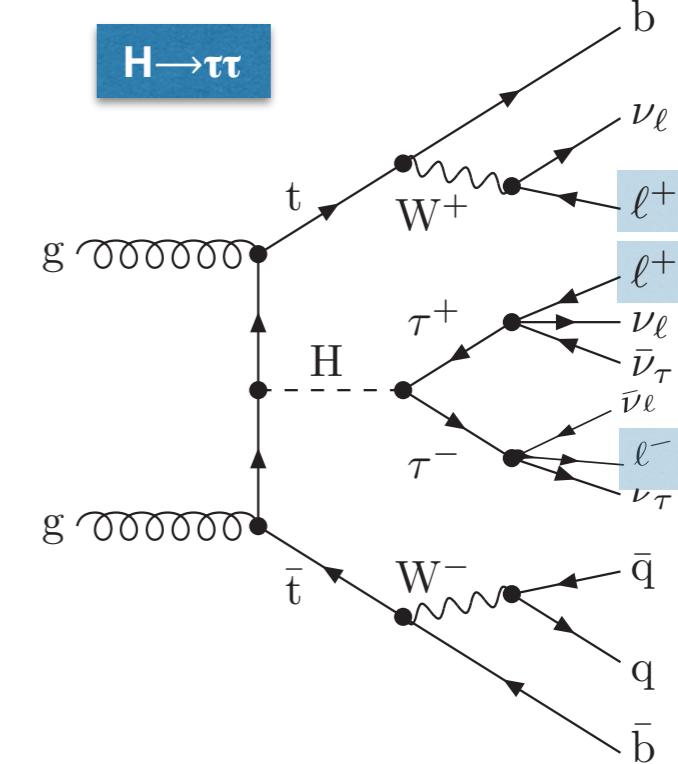

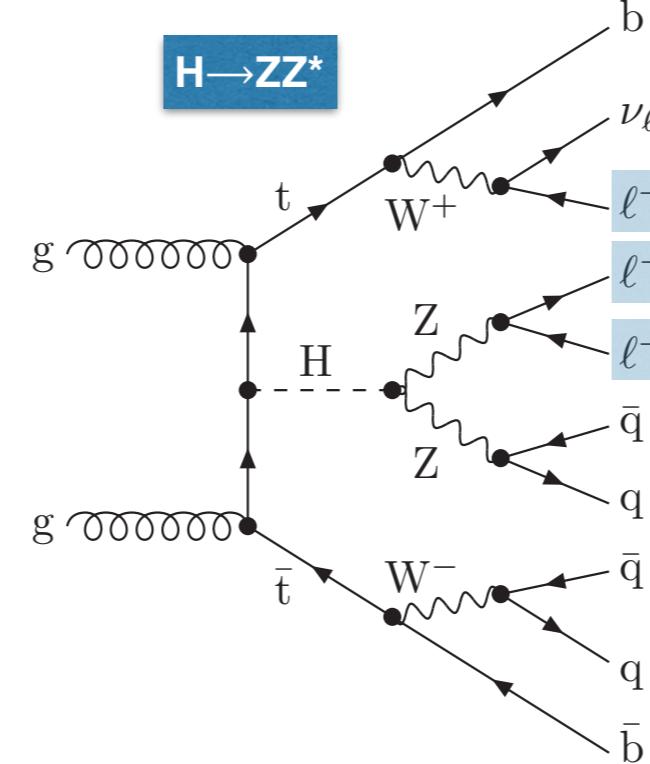

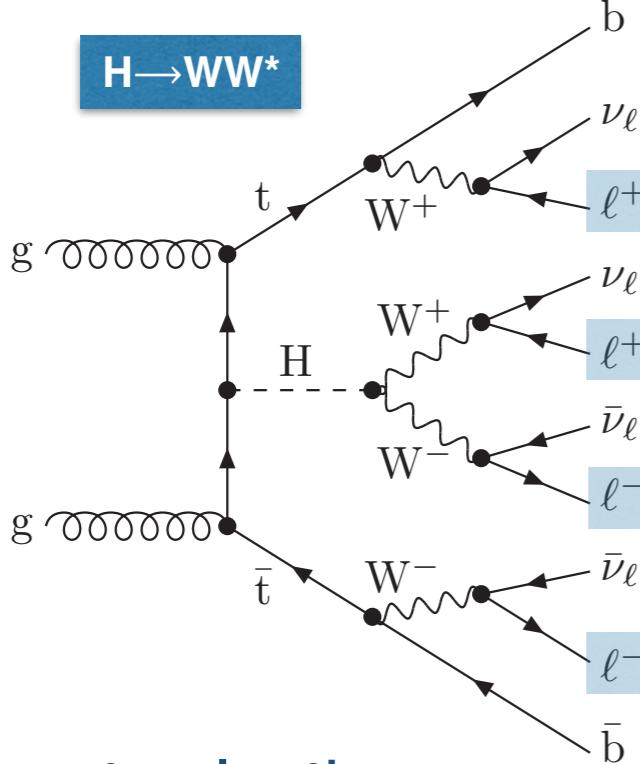

$t\bar{t}H$ MULTI-LEPTONIC

CMS PAS HIG-17-004

- Multi-lepton final states from $H \rightarrow WW^*$, $H \rightarrow ZZ^*$, $H \rightarrow \tau\tau$ (for τ leptonic decays)

- Event selection :

→ Same-sign dilepton channel (2LSS):

- 2 leptons (e or μ) with same sign : further categorisation : ee , $\mu\mu$, $e\mu$
- ≥ 4 jets

→ Three lepton channel (3L):

- 3 leptons
- ≥ 2 jets

→ Four lepton channel (4L):

- ≥ 4 leptons
- ≥ 2 jets

- **B Tag jets**: at least 1 jet passing **medium WP** or 2 jets passing **loose WP** of B tag algorithm
- **Z veto** : based on $m_{\ell\ell}$, E_T^{miss} , H_T^{miss}
- **τ_H veto** : veto events containing reconstructed τ_H ; for orthogonality with analysis for $t\bar{t}H$ in the τ_H channel
- 2LSS and 3L categories have further sub-categories based on charge of leptons, B Tag criteria

t̄H MULTI-LEPTONIC : SIGNAL EXTRACTION

Expected and observed yields after the selection in 2LSS sub-categories, 3L and 4L categories

	$\mu\mu$	$e\mu$	ee	3L	4L
t̄W	$51.0 \pm 0.6 \text{ (stat.)} \pm 6.9 \text{ (syst.)}$	$72.8 \pm 0.7 \text{ (stat.)} \pm 10.2 \text{ (syst.)}$	$20.5 \pm 0.4 \text{ (stat.)} \pm 3.1 \text{ (syst.)}$	$32.8 \pm 1.0 \text{ (stat.)} \pm 4.9 \text{ (syst.)}$

Data	150	268	89	148	3

- Background estimation:

- **Signal like final states :** t̄V, Di-boson : estimated from MC simulation
- **Others :** Non-prompt leptons (largely from t̄), charge mis-measured leptons : Data driven estimation

- Signal extraction :

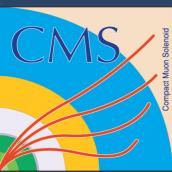

- Multivariate **BDT** discriminants trained in simulated events to separate the **signal** from **t̄V** backgrounds and also **non-prompt (t̄)** backgrounds (not for statistically limited 4L)
- 2 separate BDTs trained using kinematical observables.

- η of leptons, jet multiplicity, distance between lepton & jet, m_T , E_T^{miss}
- **Against t̄ :** 2LSS : jet BDT discriminator score that is used to identify jets from top decay
- **Against t̄V :** leading, trailing lepton p_T ;

for 2LSS : jet BDT discriminator score that is used to identify jets from Higgs decay

for 3L category : MEM weight :

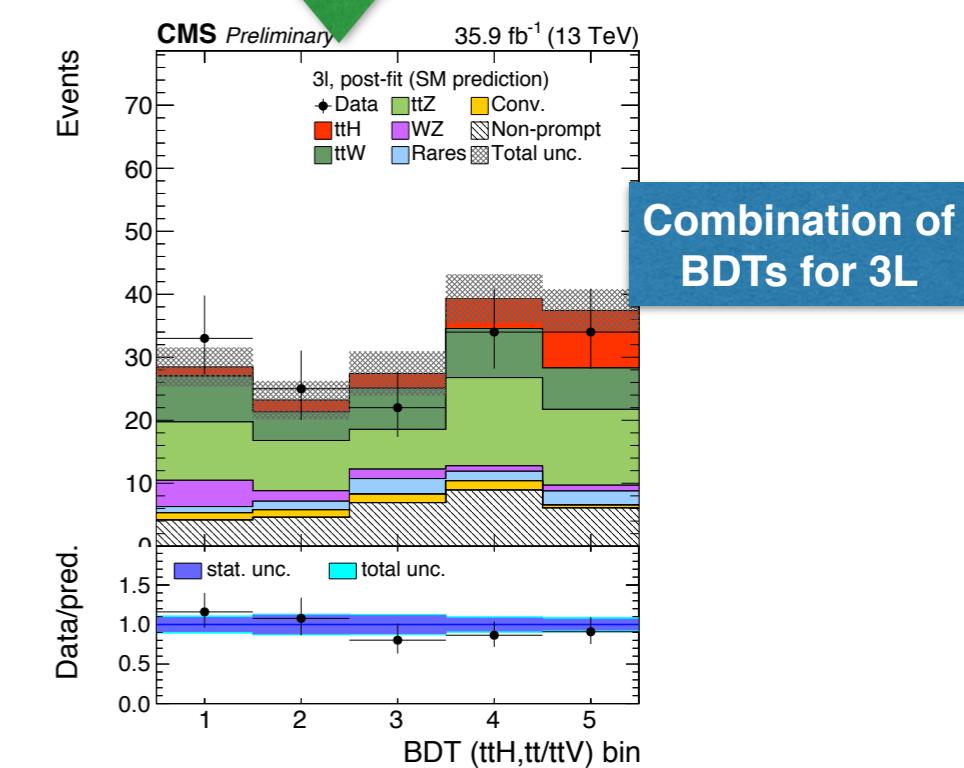

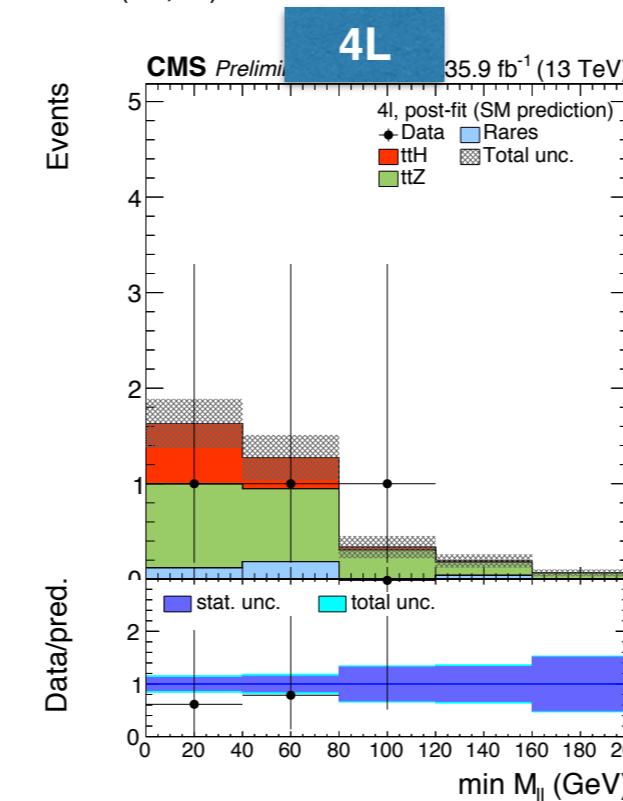

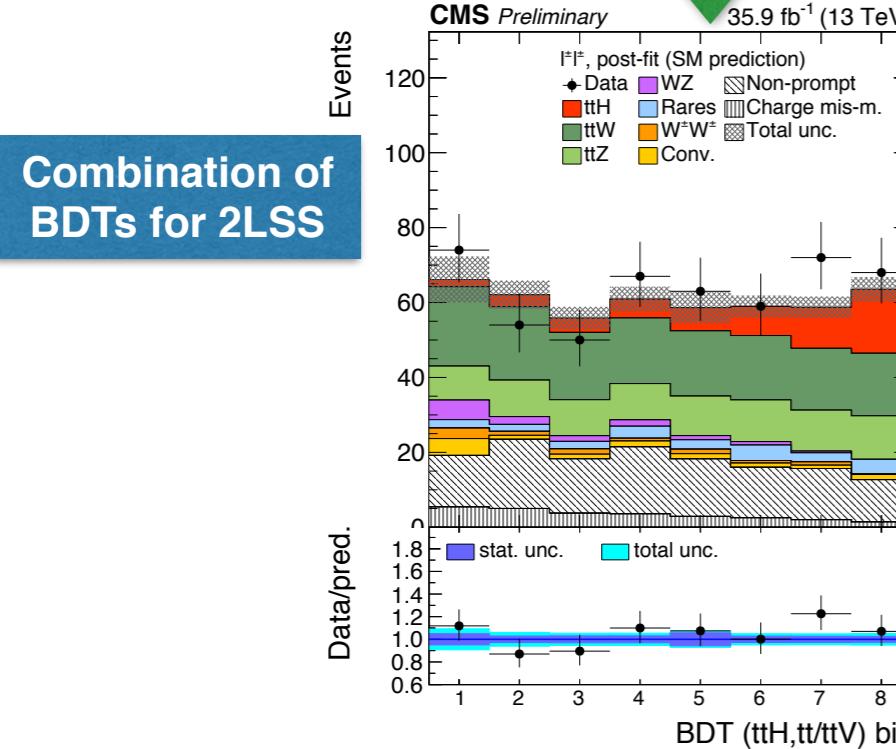

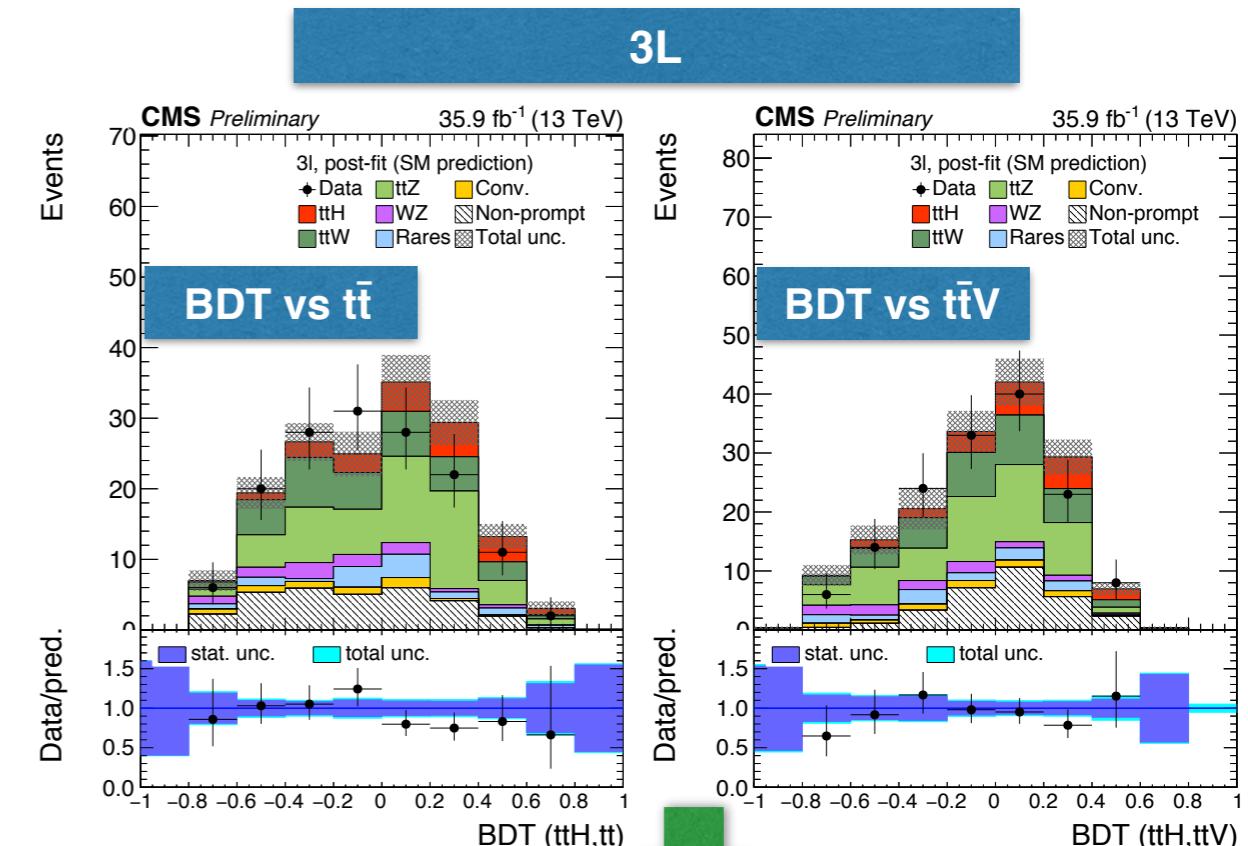

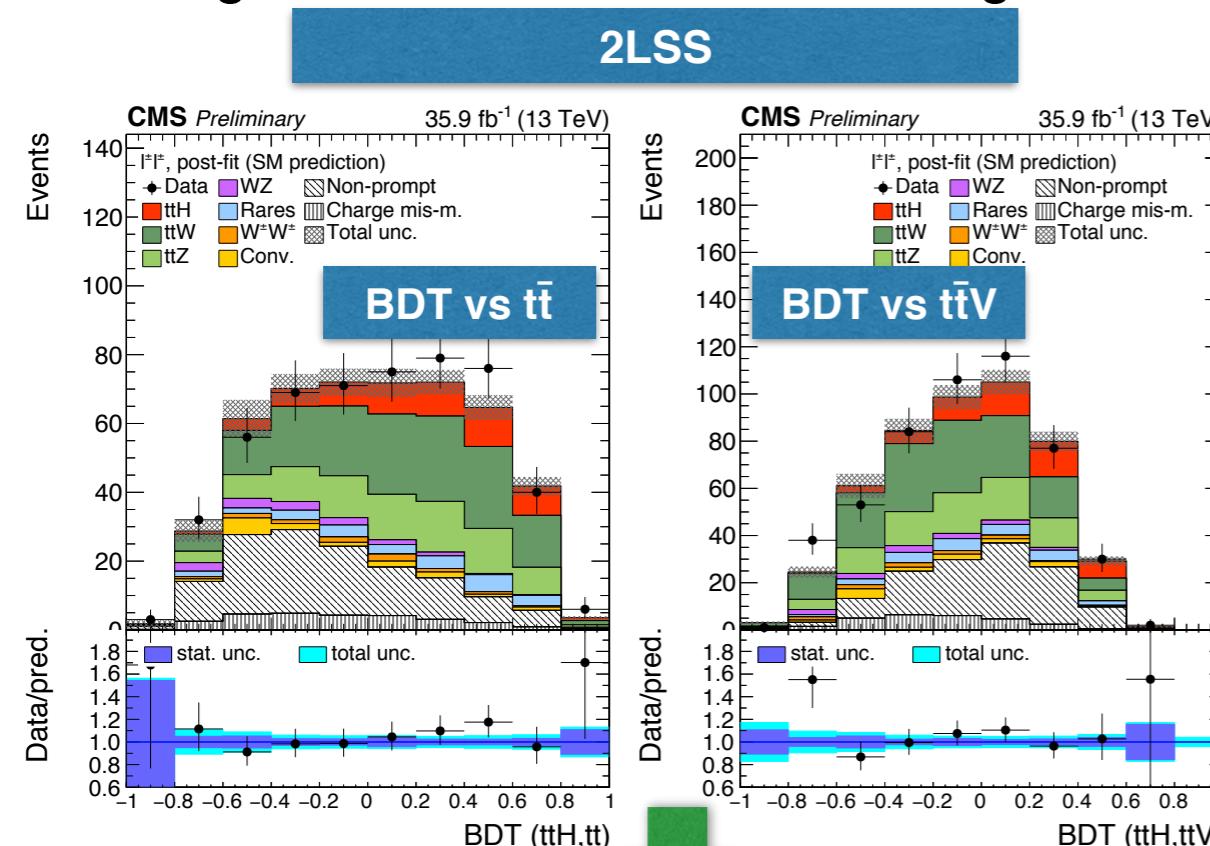

$$w_{i,\alpha}(\Phi') = \frac{1}{\sigma_\alpha} \int d\Phi_\alpha \cdot \delta^4(p_1^\mu + p_2^\mu - \sum_{k>2} p_k^\mu) \cdot \frac{f(x_1, \mu_F) f(x_2, \mu_F)}{x_1 x_2 s} \cdot \left| \mathcal{M}_\alpha(p_k^\mu) \right|^2 \cdot W(\Phi' | \Phi_\alpha)$$

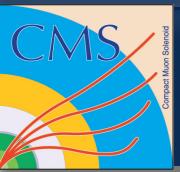

$t\bar{t}H$ MULTI-LEPTONIC : SIGNAL EXTRACTION

- Distribution of discriminating BDT outputs after fit to data, combined from different sub-categories, for 2LSS and 3L categories

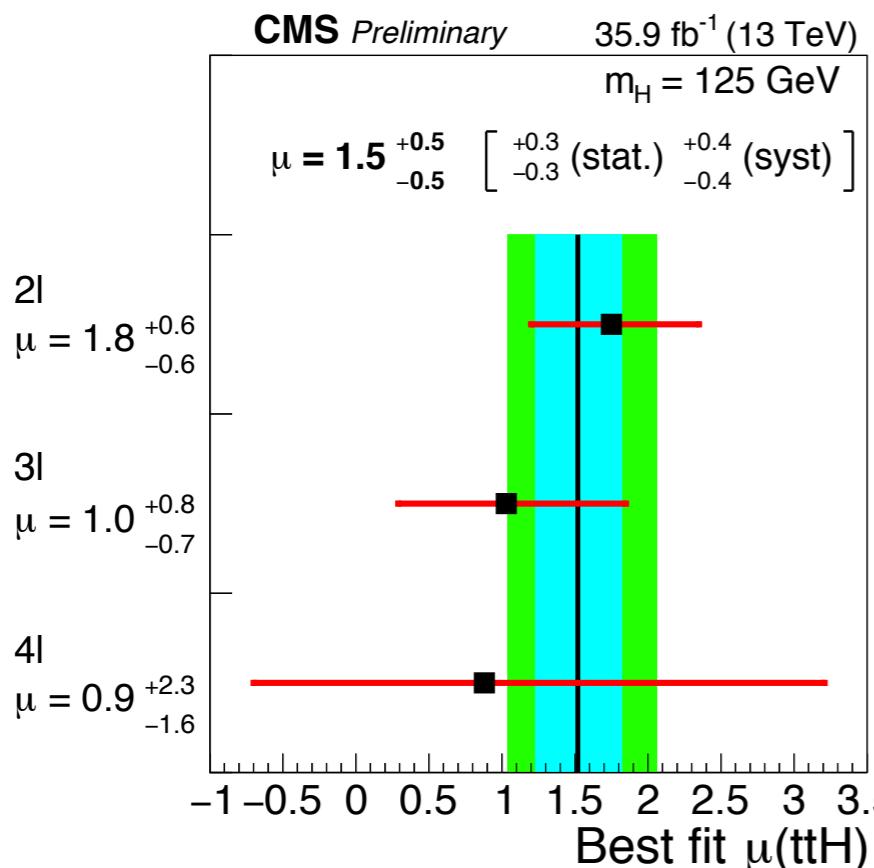

$t\bar{t}H$ MULTI-LEPTONIC : RESULTS

- Results based on 35.9 fb^{-1} of data collected during **2016** and **combination** with 2.3 fb^{-1} collected in **2015**

Signal strength measurement (2016 + 2015 dataset)

Category	Observed μ fit $\pm 1\sigma$	Expected μ fit $\pm 1\sigma$
Same-sign di-lepton	$1.7 (-0.5) (+0.6)$	$1.0 (-0.5) (+0.5)$
Three lepton	$1.0 (-0.7) (+0.8)$	$1.0 (-0.7) (+0.8)$
Four lepton	$0.9 (-1.6) (+2.3)$	$1.0 (-1.6) (+2.4)$
Combined (2016 data)	$1.5 (-0.5) (+0.5)$	$1.0 (-0.4) (+0.5)$
Combined (2015 data) [42]	$0.6 (-1.1) (+1.4)$	$1.0 (-1.1) (+1.3)$
Combined (2015+2016 data)	$1.5 (-0.5) (+0.5)$	$1.0 (-0.4) (+0.5)$

Limits on signal strength (2016 dataset)

Category	Observed limit	Expected limit $\pm 1\sigma$
Same-sign di-lepton	2.8	$0.9 (-0.3) (+0.4)$
Three lepton	2.5	$1.4 (-0.4) (+0.7)$
Four lepton	5.9	$4.9 (-1.7) (+3.1)$
Combined	2.5	$0.8 (-0.2) (+0.3)$

- Main sources of systematic uncertainties:
 - Lepton selection efficiency, modelling of non-prompt backgrounds, charge mis-identification, diboson background modelling, theoretical uncertainties
- Signal significance **observed** (expected) : **3.3σ (2.5σ)**

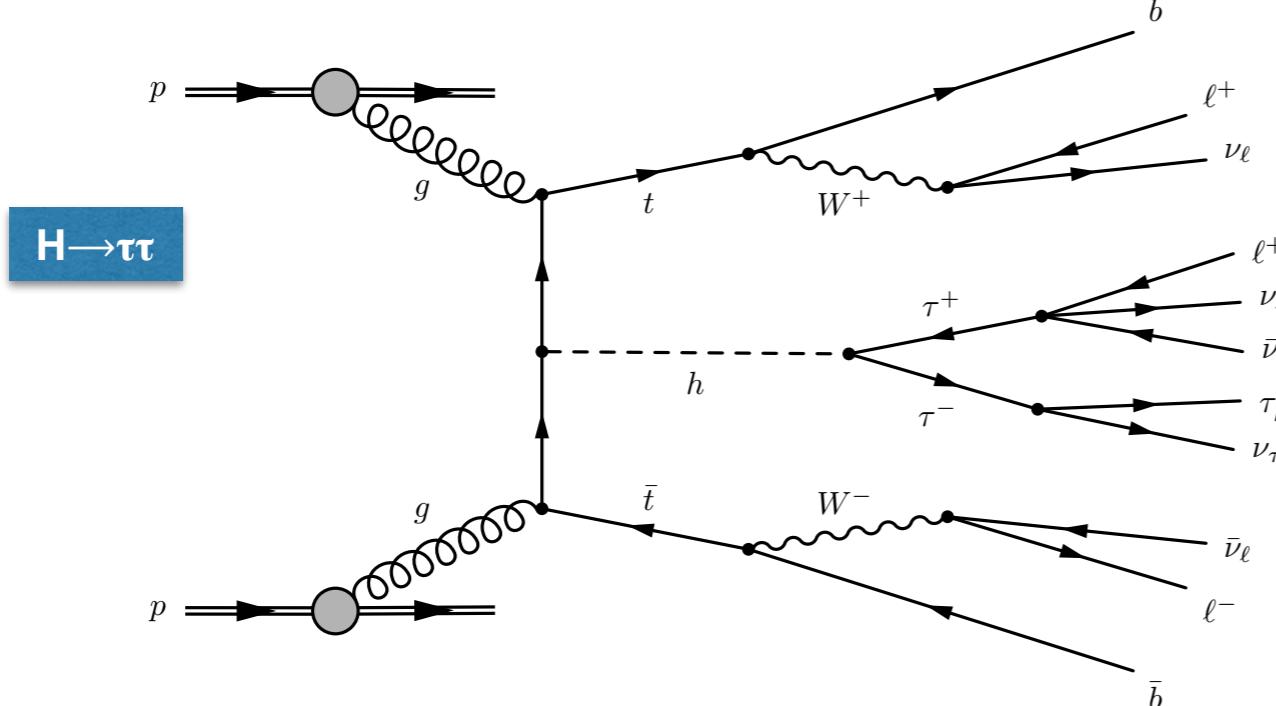

$t\bar{t}H$ TAU-HADRONIC (τ_H)

CMS PAS HIG-17-003

- Tau-lepton decaying hadronically in final state : $H \rightarrow \tau\tau$ (also $H \rightarrow WW^*$, $H \rightarrow ZZ^*$)

τ_H identification: Dedicated MVA based discriminant (isolation, impact parameter, τ lifetime) with “hadrons plus strips” (HPS) algorithm to identify

$$\begin{aligned}\tau^\pm &\rightarrow h^\pm \nu_\tau \\ \tau^\pm &\rightarrow h^\pm \pi^0 \nu_\tau \\ \tau^\pm &\rightarrow h^\pm \pi^0 \pi^0 \nu_\tau \\ \tau^\pm &\rightarrow h^\pm h^\mp h^\pm \nu_\tau.\end{aligned}$$

- Event selection :

→ $1\ell + 2\tau_H$:

- 1 lepton (e or μ)
- 2 τ_H opposite charge, ‘tight’ WP of τ_H ID, $p_T > 30, 20$ GeV
- ≥3 hadronic jets

→ $3\ell + 1\tau_H$:

- ≥3 leptons of
- 1 τ_H sum of charge with $\ell = 0$, ‘medium’ WP of τ_H ID, $p_T > 20$ GeV
- ≥2 hadronic jets

→ $2\ell ss + 1\tau_H$:

- 2 leptons of same sign
- 1 τ_H opposite charge wrt ℓ , ‘medium’ WP of τ_H ID, $p_T > 20$ GeV
- ≥3 hadronic jets
- sub-categories :
 - no-missing-jet : full reconstruction of $t\bar{t}H \rightarrow bW\bar{b}W\tau\tau \rightarrow bjj\bar{b}l\nu\ell\bar{\nu}_\ell\nu_\tau\tau_h\bar{\nu}_\tau$
 - missing-jet : one jet missing : outside acceptance overlapping

→ **B Tag jets**: at least 1 jet passing **medium** WP or 2 jets passing **loose** WP

→ **Z veto** : based on $m_{\ell\ell}$, E_T^{miss} , H_T^{miss}

$t\bar{t}H$ TAU-HADRONIC (τ_H) : SIGNAL EXTRACTION

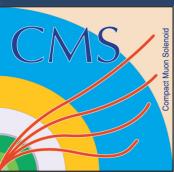

Expected and observed yields after the selection in the different categories

Process	$1\ell + 2\tau_h$	$3\ell + 1\tau_h$
$t\bar{t}H, H \rightarrow \tau\tau$	2.84 ± 1.35	1.01 ± 0.65
$t\bar{t}H, H \rightarrow WW$	0.07 ± 0.04	0.63 ± 0.29

Observed data	8	41	

- Background estimation:
 - Irreducible : $t\bar{t}V$, Di-boson+jets (estimated from MC, validated in data)
 - Reducible : Non-prompt leptons (largely from $t\bar{t}$), charge mis-measured leptons : Data driven estimation. τ_H : data driven estimate in $1\ell+2\tau_H$ category, simulation based estimate in other categories.
- Signal extraction :
 - Signal extraction through maximum likelihood fit to the distribution of discriminating observable
 - Multivariate BDT discriminants to separate the signal from $t\bar{t}$, $t\bar{t}V$ backgrounds, separately in each category
 - Additionally MEM based discriminant used in $2\ell ss + 1\tau_H$ category to discriminate signal from $t\bar{t}V$ backgrounds

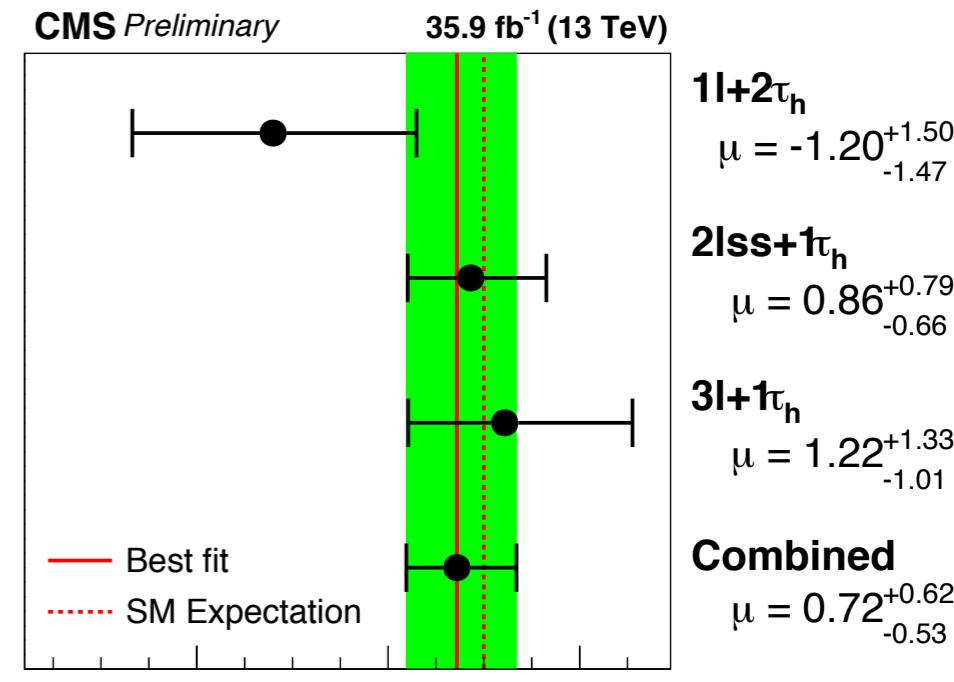

$t\bar{t}H$ TAU-HADRONIC (τ_H) : RESULTS

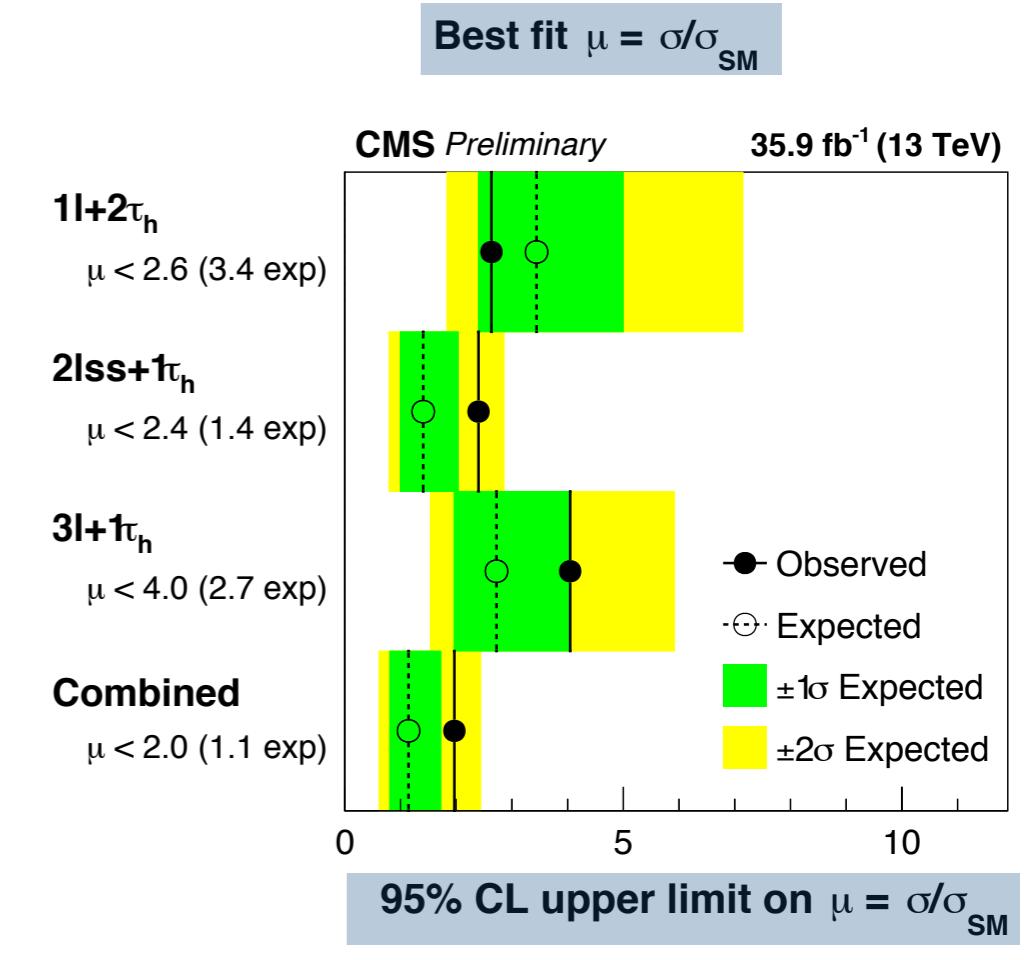

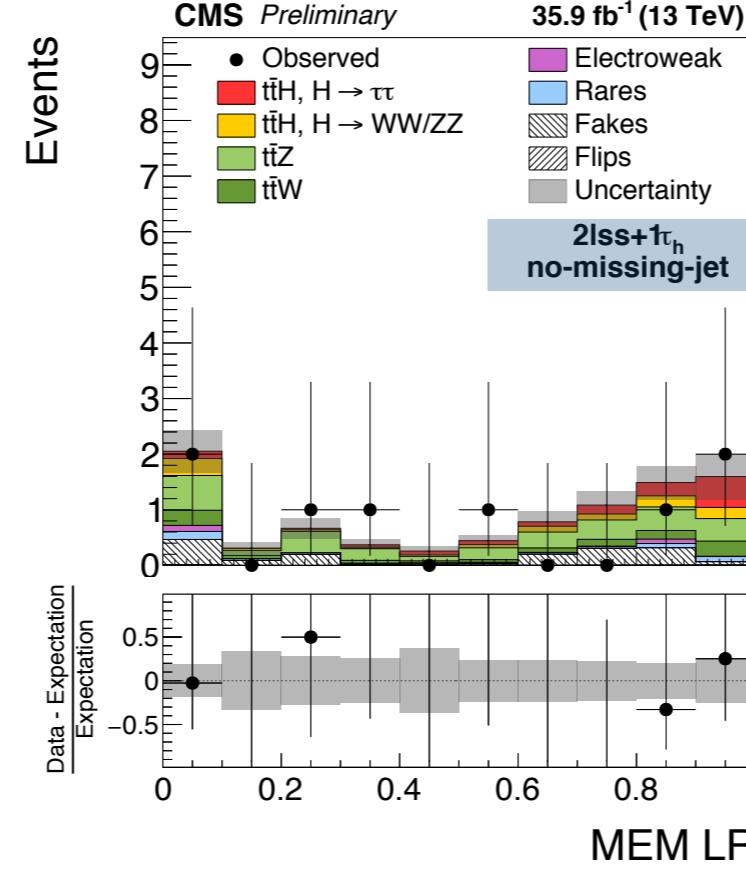

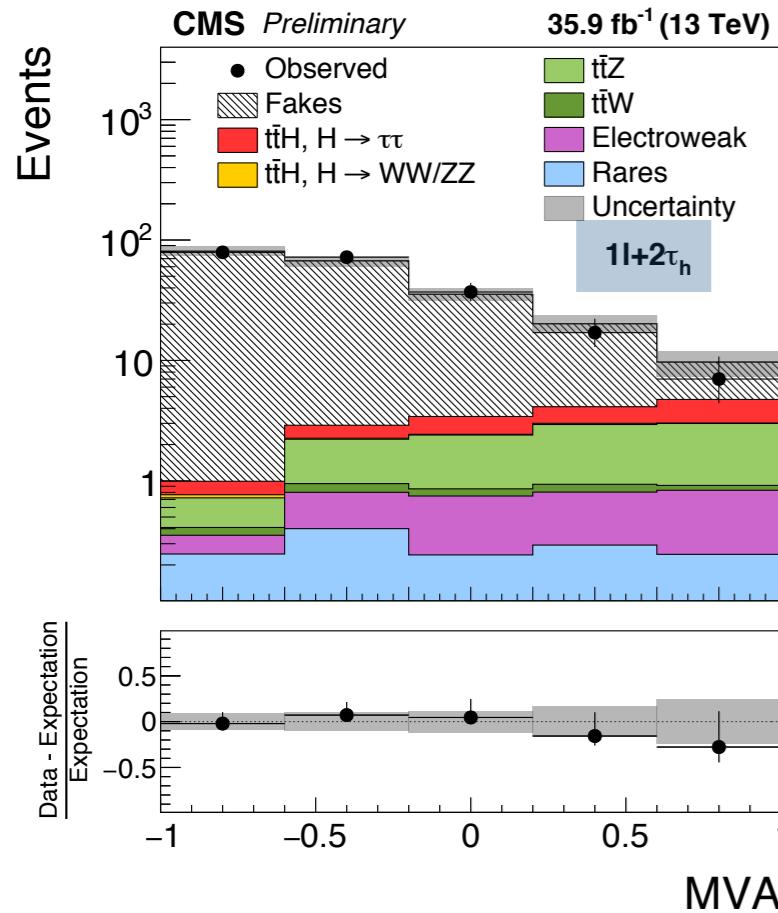

- Results based on 35.9 fb^{-1} of data collected during **2016**
- Main sources of systematic uncertainties:
 - Affects yield : Charge mis-measurement, lepton & τ_H efficiency, theory uncertainty
 - Affects shape : Jet & τ_H energy scale, b-tag efficiency, fake background estimation, modelling of signal and background in simulation
- Signal significance **observed** (expected) : 1.4σ (1.8σ)

Signal strength and limits

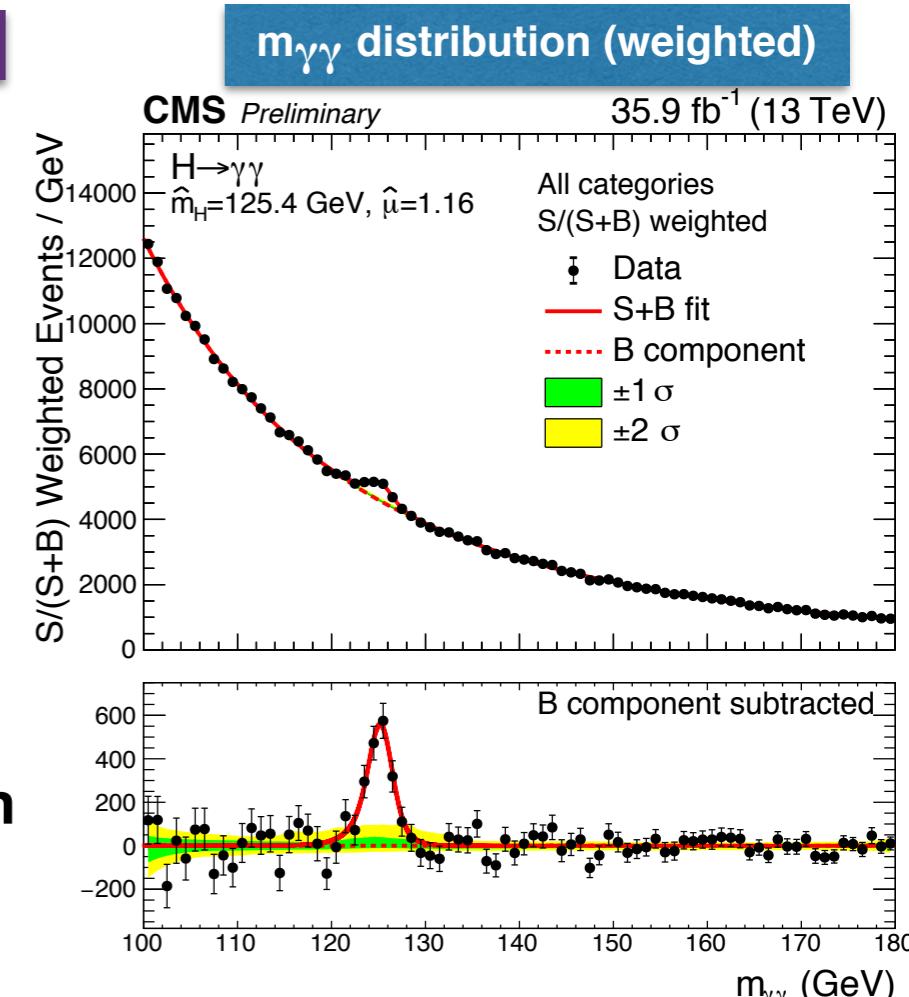

Signal extraction fits

$t\bar{t}H$ WITH $H \rightarrow \gamma\gamma$

- A part of the general $H \rightarrow \gamma\gamma$ analysis Talk by Michael Planner
- Events with **two** high p_T isolated **photons** selected
- Narrow **peak** around m_H on top of the falling **$m_{\gamma\gamma}$ distribution**
- Different production modes ($t\bar{t}H$, $V BH$, VH) identified based on **additional final state objects**
- Signal, background extraction from **fit to $m_{\gamma\gamma}$ distribution**
- Overview of the $H \rightarrow \gamma\gamma$ analysis :

- **Event categorisation for different production modes of Higgs** based on
 - **additional final state objects** to tag **production modes**
 - mass resolution and kinematics for the '**Untagged**' categories

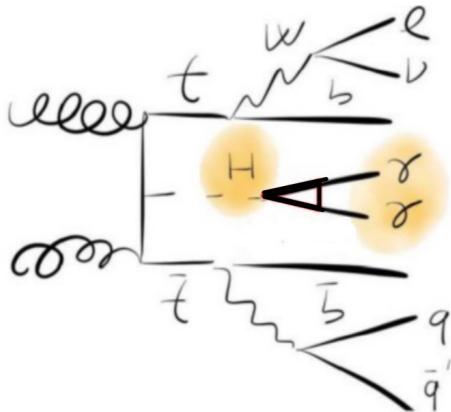

$t\bar{t}H$ WITH $H \rightarrow \gamma\gamma$: $t\bar{t}H$ CATEGORIES

- 2 categories corresponding to $t\bar{t}H$ based on the decay of the top quarks

- **TTH Leptonic Tag:**

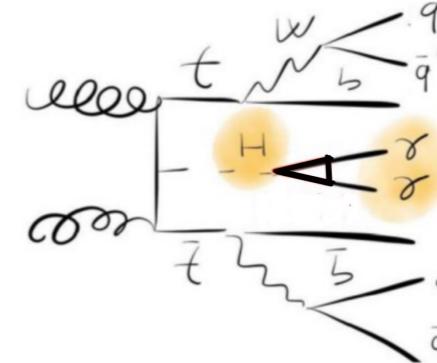

$$t\bar{t} \rightarrow bl\nu_l\bar{b}q\bar{q}' \quad \text{or} \quad t\bar{t} \rightarrow bl\nu_l\bar{b}l'\nu_{l'}$$

- Cut based approach:

- ≥ 1 lepton (muon or electron)
- ≥ 2 jets
- ≥ 1 B-tagged jet
- Diphoton BDT cut

- **TTH Hadronic Tag:** $t\bar{t} \rightarrow bq\bar{q}'\bar{b}q\bar{q}'$

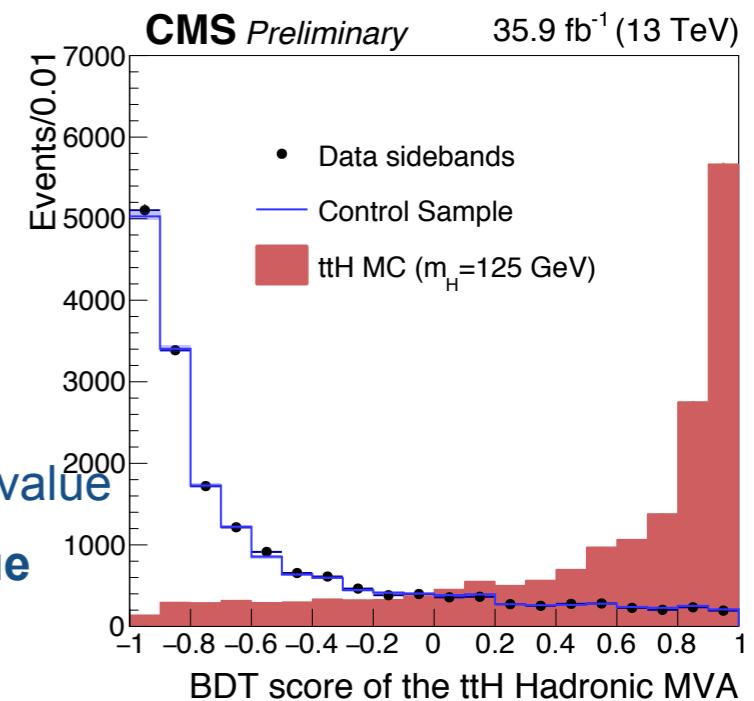

- Loose selection :

- ≥ 3 jets
- ≥ 1 B-jet (loose WP)
- 0 leptons

- **MVA with inputs:**

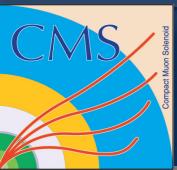

- number of jets
- lead jet p_T
- Max B-tag discriminant value
- Second max B-tag value

- Diphoton BDT cut

Expected signal for $t\bar{t}H$ categories : very pure in $t\bar{t}H$ contribution

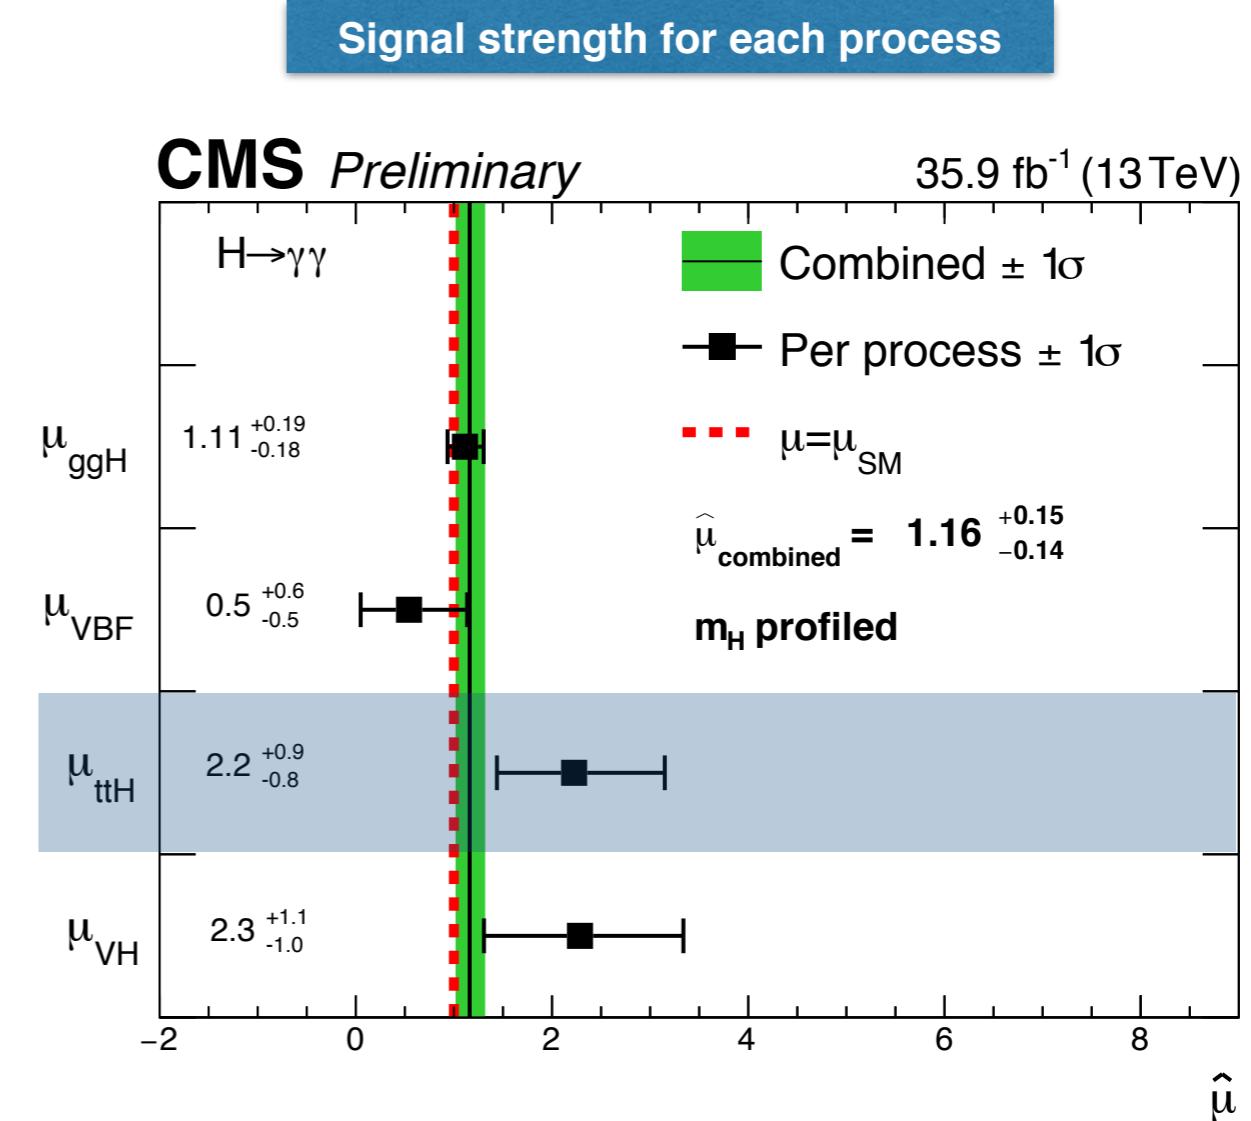

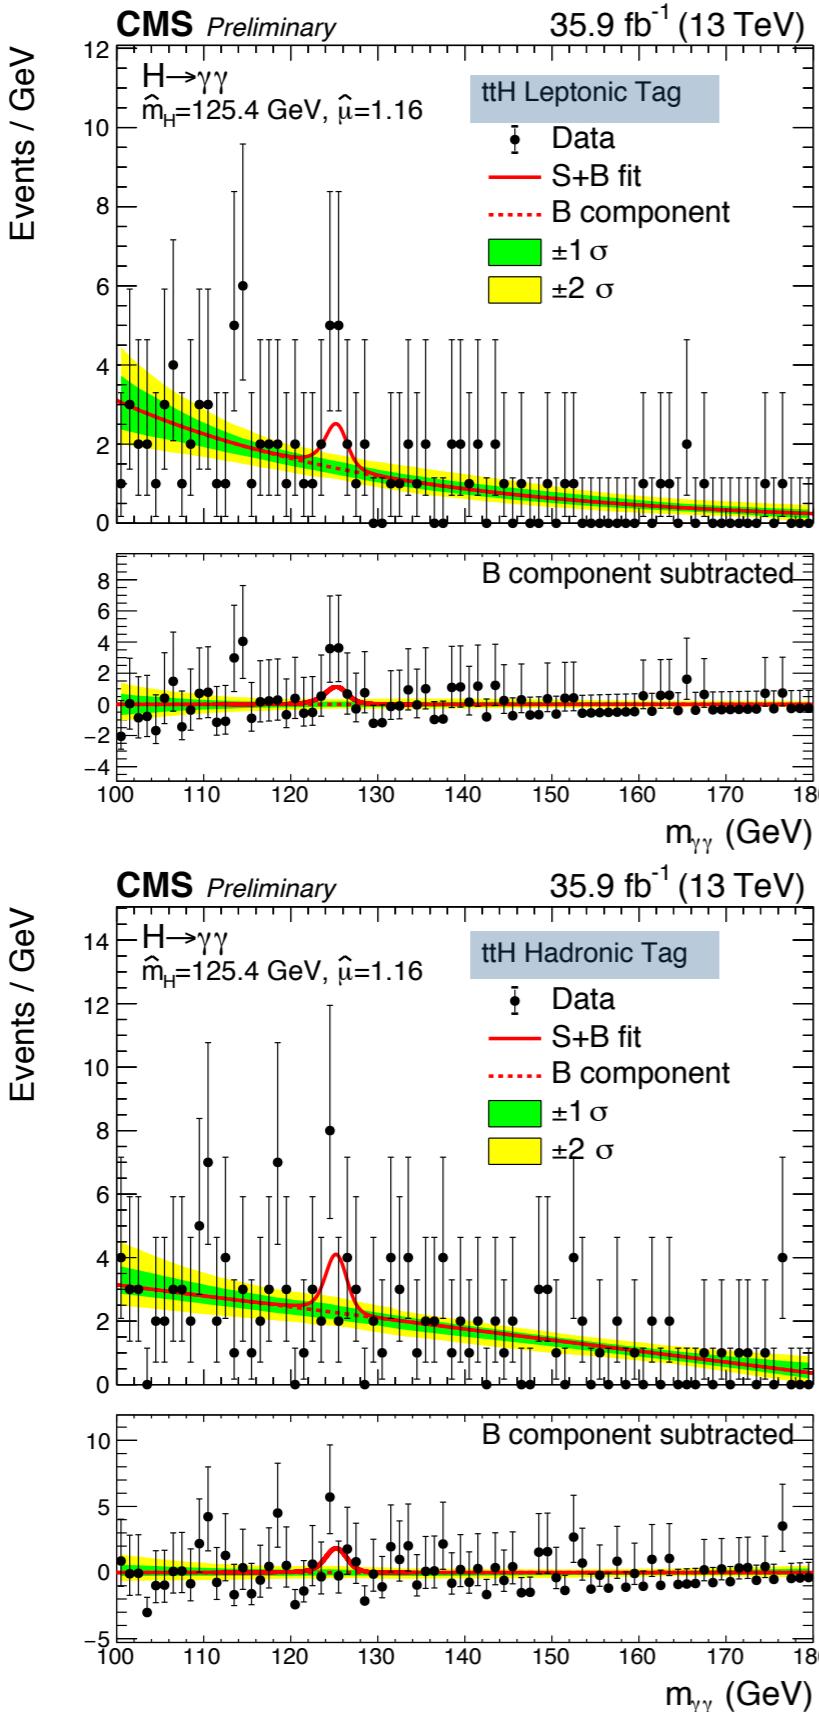

Event Categories	SM 125 GeV Higgs boson expected signal												Bkg (GeV^{-1})	
	Total	ggH	VBF	ttH	bbH	tHq	tHW	WH lep	ZH lep	WH had	ZH had	σ_{eff}	σ_{HM}

$t\bar{t}H$ WITH $H \rightarrow \gamma\gamma$: RESULTS

- Results based on 35.9 fb^{-1} of data at 13 TeV collected during **2016**

- Uncertainties are statistics dominated
- Signal significance **observed** (expected) : 3.3σ (1.5σ)

SUMMARY & OUTLOOK

- Search for $t\bar{t}H$ at CMS in Run 2 (13 TeV) are being performed in different decay modes of the Higgs, with complex analysis techniques. Latest results are compatible with standard model :

→ Multi-leptonic ($H \rightarrow ZZ^*$, $H \rightarrow WW^*$, $H \rightarrow \tau\tau$) : 35.9 fb^{-1} (2016) + 2.3 fb^{-1} (2015)

CMS PAS HIG-17-004

$$\cdot \mu_{t\bar{t}H} = 1.5^{+0.5}_{-0.5} (\pm 0.29 \text{ stat.} \pm 0.24 \text{ theo.} \pm 0.32 \text{ exp.})$$

• observed (expected) significance of 3.3σ (2.5σ)

→ τ_H ($H \rightarrow \tau\tau$, also $H \rightarrow ZZ^*$, $H \rightarrow WW^*$): 35.9 fb^{-1} (2016)

CMS PAS HIG-17-003

$$\cdot \mu_{t\bar{t}H} = 0.72^{+0.62}_{-0.53}$$

• observed (expected) significance of 1.4σ (1.8σ)

→ $H \rightarrow \gamma\gamma$: 35.9 fb^{-1} (2016)

CMS PAS HIG-16-040

$$\cdot \mu_{t\bar{t}H} = 2.2^{+0.9}_{-0.8} \text{ (stat. dominated)}$$

• observed (expected) significance of 3.3σ (1.5σ)

→ $H \rightarrow b\bar{b}$: 12.9 fb^{-1} (2016)

CMS PAS HIG-16-038

$$\cdot \mu_{t\bar{t}H} = -0.19^{+0.8}_{-0.81} \left({}^{+0.45}_{-0.44} \text{ stat.} \quad {}^{+0.66}_{-0.68} \text{ syst.} \right)$$

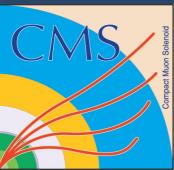

- Data taking for 2017 underway, more updates to come from Run 2...

The data says we need more data.

ADDITIONAL MATERIAL

SUMMARY OF RUN-1 RESULTS

- Studies of the $t\bar{t}H$ production in LHC Run-1 at CMS were based on the different Higgs decay channels : $\gamma\gamma$, $b\bar{b}$, $\tau\tau$ (hadronic) and multi-leptonic ($H \rightarrow ZZ^*$, $H \rightarrow WW^*$, $H \rightarrow \tau\tau$ with multi-lepton final states).

Combination of different Higgs decay channels :

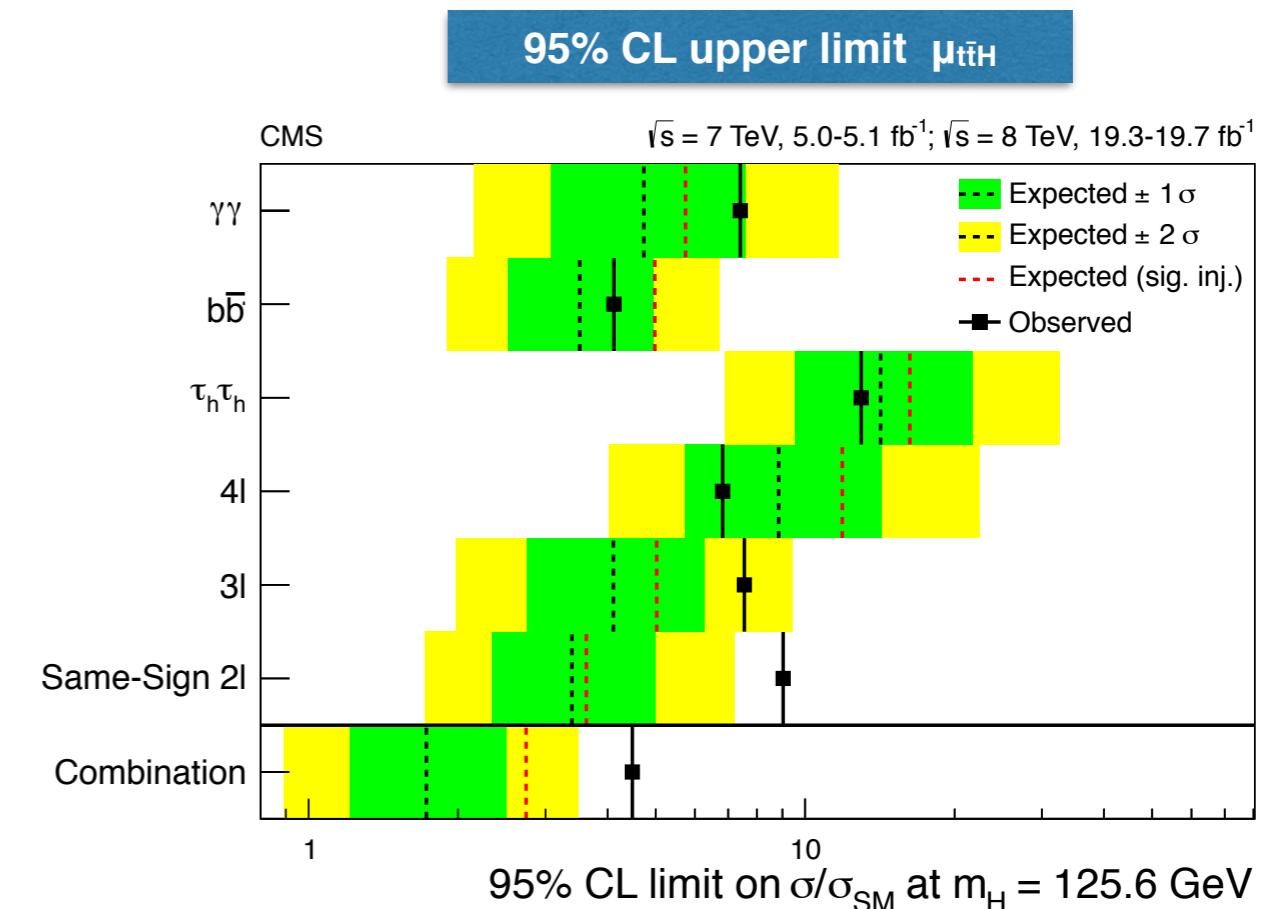

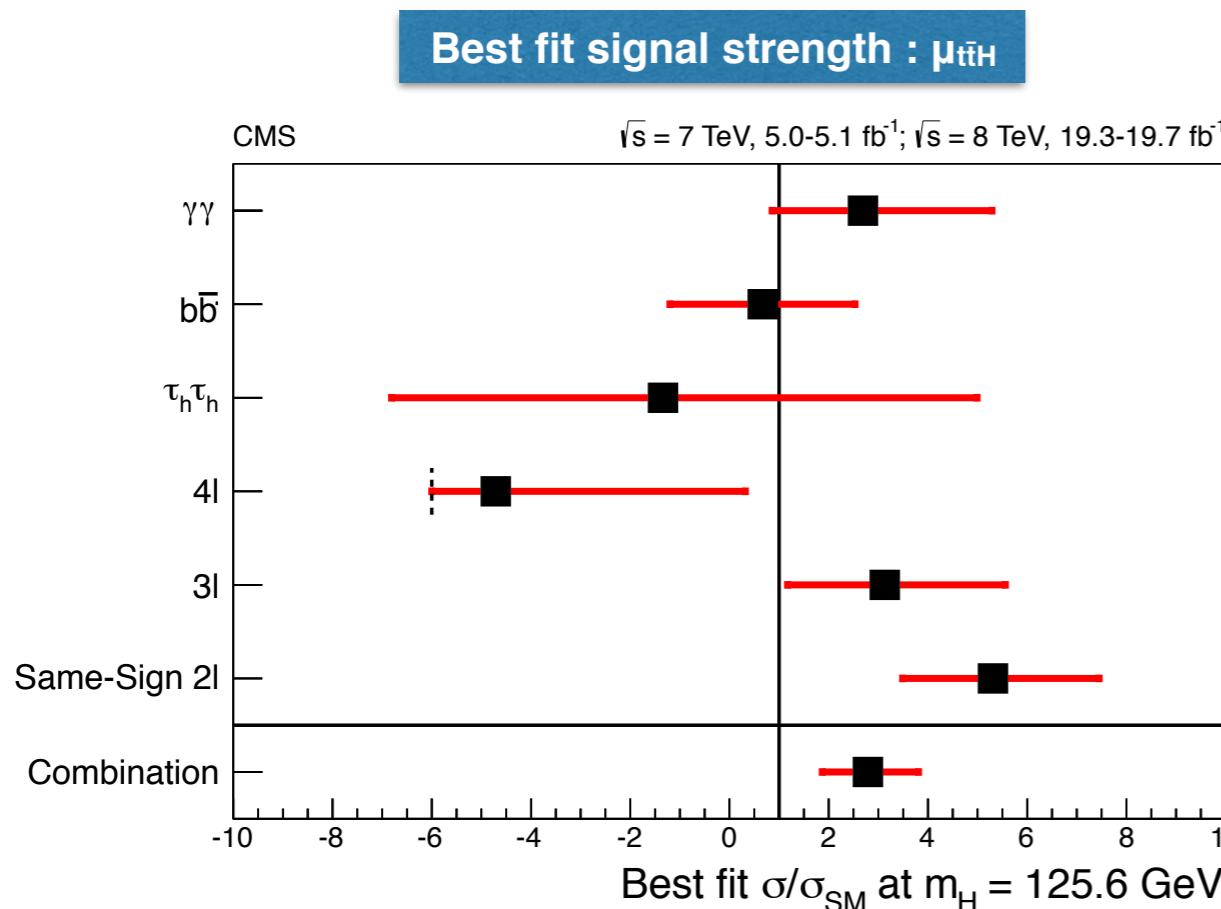

CMS PAS HIG-13-029

JHEP09(2014)087

- $\rightarrow t\bar{t}H$ combination from Run1 CMS measurements :

► $\mu_{t\bar{t}H} = 2.8 \pm 1.0$

► 95% CL limit = 4.5

CMS AT THE LHC

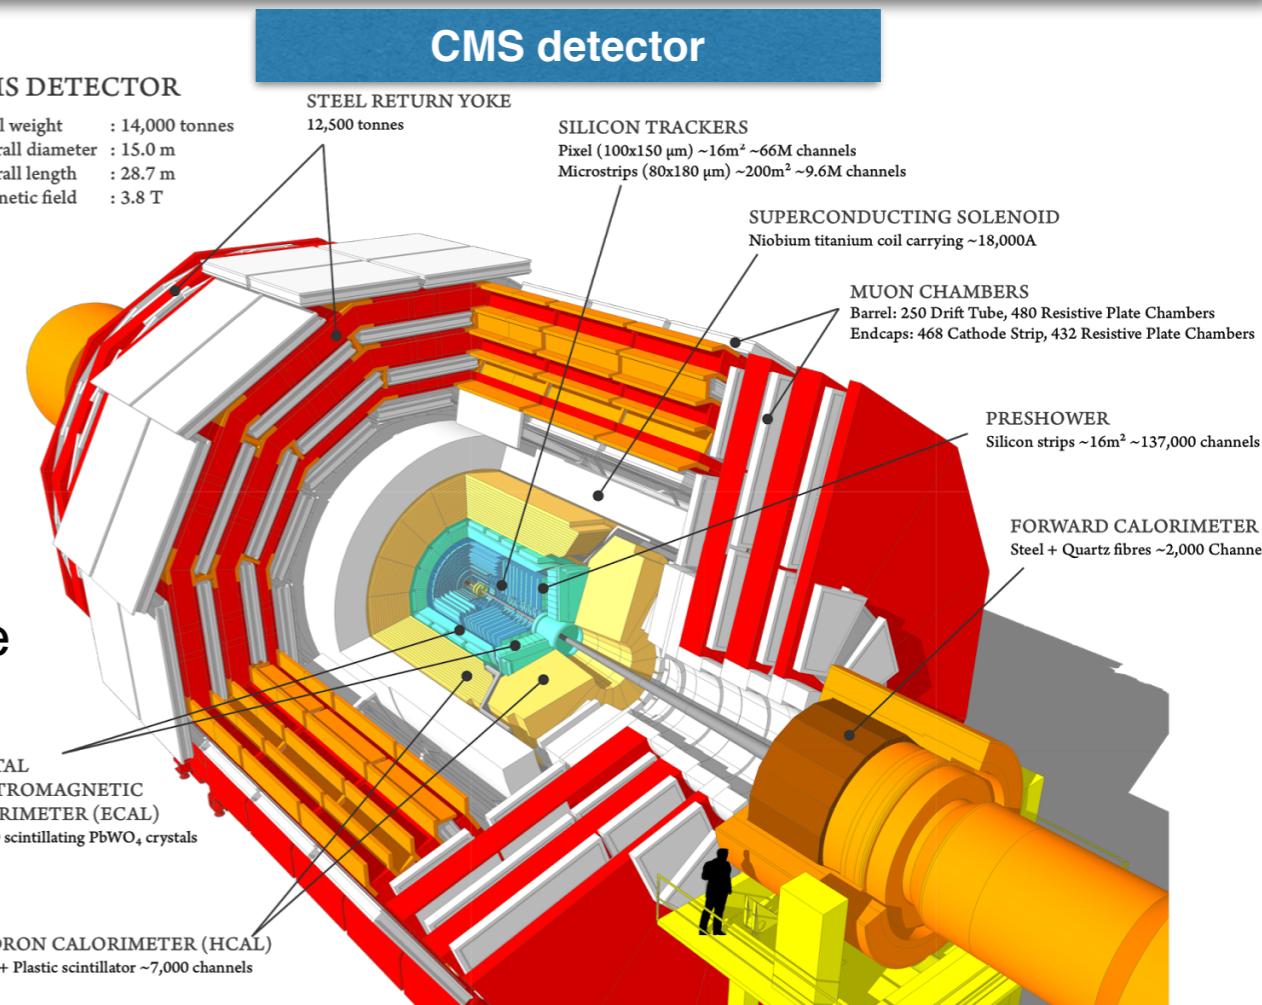

- Compact Muon Solenoid (CMS) is a general purpose detector at the LHC

- Multiple layers based around the solenoid magnet to detect different kinds of particles
- ttH process produces **jets, leptons** along with photons, other sub detectors also play crucial role

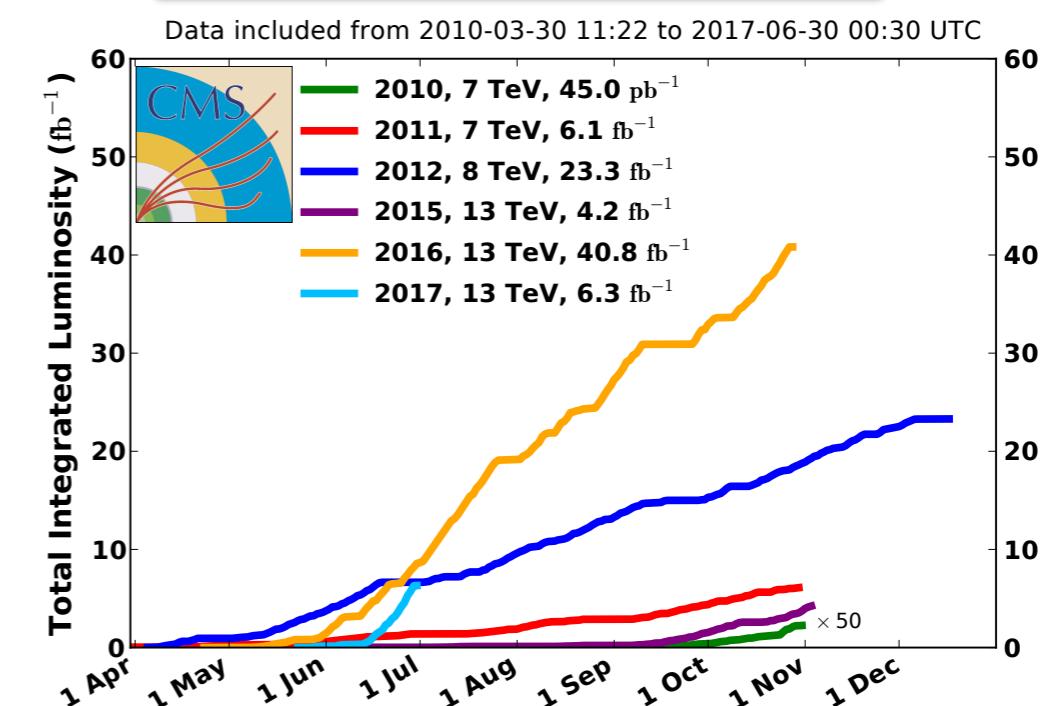

- LHC operations for proton-proton collisions

- At center of mass energies of 7 TeV (2010-11) and 8 TeV (2012) during Run 1
- At center of mass energy of **13 TeV** during **Run 2** (2015-18)
- CMS is expected to collect 100 fb^{-1} by the end of Run 2 (2018) and 300 fb^{-1} by the end of Phase 1 (2022)

- Analyses presented in **this talk** : 35.9 fb^{-1} of data at **13 TeV** collected in **2016**

CMS integrated luminosity (pp)

RESULTS WITH LIMITS

- Search for **t̄H** at **CMS** in **Run 2** (13 TeV) are being performed in different decay modes of the Higgs, with complex analysis techniques. Latest results are compatible with standard model :

→ **Multi-leptonic ($H \rightarrow ZZ^*$, $H \rightarrow WW^*$, $H \rightarrow \tau\tau$)** : 35.9 fb^{-1} (2016) + 2.3 fb^{-1} (2015)

CMS PAS HIG-17-004

- $\mu_{t\bar{t}H} = 1.5^{+0.5}_{-0.5}$ (± 0.29 stat. ± 0.24 theo. ± 0.32 exp.)

- **observed (expected) significance of 3.3σ (2.5σ)**

- **observed (expected) limits on $\mu_{t\bar{t}H} = 2.5$ (0.8 without SM t̄H)**

→ **τ_H ($H \rightarrow \tau\tau$, also $H \rightarrow ZZ^*$, $H \rightarrow WW^*$)**: 35.9 fb^{-1} (2016)

CMS PAS HIG-17-003

- **observed (expected) significance of 1.4σ (1.8σ)**

- **observed (expected) limits on $\mu_{t\bar{t}H} = 2.0$ (2.2 with SM t̄H; 1.1 without SM t̄H)**

→ **$H \rightarrow \gamma\gamma$** : 35.9 fb^{-1} (2016)

CMS PAS HIG-16-040

- $\mu_{t\bar{t}H} = 2.2^{+0.9}_{-0.8}$ (stat. dominated)

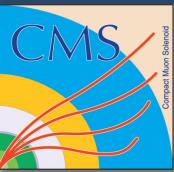

- **observed (expected) significance of 3.3σ (1.5σ)**

→ **$H \rightarrow b\bar{b}$** : 12.9 fb^{-1} (2016)

CMS PAS HIG-16-038

- $\mu_{t\bar{t}H} = -0.19^{+0.8}_{-0.81}$ ($^{+0.45}_{-0.44}$ stat. $^{+0.66}_{-0.68}$ syst.)

- **observed (expected) limits on $\mu_{t\bar{t}H} = 1.5$ (1.7)**
