

## Introduction

- $B \rightarrow K^{*} \ell^{+} \ell^{-}$and $B^{+} \rightarrow K^{+} \tau^{+} \tau^{-}$are flavor-changing neutral current (FCNC) ${ }^{\text {EW penguin }}$ decays that are forbidden in the SM at tree level ( $\ell^{ \pm}=e^{ \pm}$or $\mu^{ \pm}$)
- They proceed at higher orders via penguin loops \& box diagrams
- New physics (NP) adds new loops with new particles

$\rightarrow$ modifies SM predictions

$\rightarrow$ probes new physics at $\sim$ few TeV scale
- Angular observables bear high sensitivity to NP
- $B^{+} \rightarrow K^{+} \tau^{+} \tau^{-}$is highly suppressed in the SM and the $\tau$ may couple stronger to NP than light $\ell$
G. Eigen, EPS17 Venice, 06/07/2017

## Angular

## Asymmetries

## in the Decays $B \rightarrow K^{*} \ell^{+} \ell^{-}$

## Angular Distributions in $B \rightarrow K^{*} \ell^{+} \ell^{-}$

- The $B \rightarrow K^{*} \ell^{+} \ell^{-}$angular distribution depends on three angles, $\theta_{K}, \theta_{\ell}, \phi$
- $\theta_{K}$ is angle between $K \& B$ in $\mathrm{K}^{*}$ rest frame
- $\theta_{\ell}$ is angle between $\ell^{+}\left(\ell^{-}\right) \& B(\bar{B})$ in $\ell^{+} \ell^{-}$rest frame
- $\phi$ is the angle between the di-lepton and $K \pi$ decay planes

- The full angular distribution involves 11 coefficients that can be determined from angular fits for each $\mathrm{q}^{2}=\mathrm{m}_{\ell \ell}$ bin $\rightarrow$ for $C P$-averaged rates get 8 independent coefficients
- Use 1-d projections due to limited-statistics samples
e $W\left(\cos \theta_{K}\right)=\frac{3}{2} \mathcal{F}_{L}\left(q^{2}\right) \cos ^{2} \theta_{K}+\frac{3}{4}\left(1-\mathcal{F}_{L}\left(q^{2}\right)\right) \sin ^{2} \theta_{K} \quad \mathcal{F}_{L}\left(q^{2}\right)$ : $K^{*}$ longitudinal polarization
- $W\left(\cos \theta_{\ell}\right)=\frac{3}{4} \mathcal{F}_{L}\left(q^{2}\right) \sin ^{2} \theta_{\ell}+\frac{3}{8}\left(1-\mathcal{F}_{L}\left(q^{2}\right)\right)\left(1+\cos ^{2} \theta_{\ell}\right)+\mathcal{A}_{F B}\left(q^{2}\right) \cos \theta_{\ell} \quad \mathcal{A}_{F B}\left(q^{2}\right)$ : lepton forwardbackward asymmetry
- Fit angular distributions in 5 bins of $\mathrm{q}^{2} \& \mathrm{q}^{2}{ }_{0}=1-6 \mathrm{GeV}^{2}$ to extract $\mathcal{F}_{\mathrm{L}}\left(\mathrm{q}^{2}\right)$ and $\mathcal{A}_{\mathrm{FB}}\left(\mathrm{q}^{2}\right)$
- Determine also $P_{2}\left(q^{2}\right)=(-2 / 3) * \mathcal{A}_{\mathrm{FB}}\left(q^{2}\right) /\left(1-\mathcal{F}_{\mathrm{L}}\left(q^{2}\right)\right)$ that has smaller theory uncertainty

## Analysis Methodology

BDTs for $B^{+} \rightarrow K^{+}\left(\rightarrow K_{s}^{0} \pi^{+}\right) e^{+} e^{-}$

- Reconstruct 5 final states:
- $B^{+} \rightarrow K^{*+}\left(\rightarrow K^{0}{ }^{0} \pi^{+}\right) \mu^{+} \mu^{-}$
- $B^{0} \rightarrow K^{*} 0\left(\rightarrow K^{+} \pi\right) \mu^{+} \mu^{-}$
- $B^{+} \rightarrow K^{++}\left(\rightarrow K^{0}{ }_{S} \pi^{+}\right) e^{+} e^{-}$
- $\left.B^{+} \rightarrow K^{+}+\rightarrow K^{+} \pi^{0}\right) e^{+} e^{-}$
- $B^{0} \rightarrow K^{*}\left(\rightarrow K^{+} \pi\right) e^{+} e^{-}$
- Use kinematic variables:

- $m_{E S}=\sqrt{E_{\text {beam }}^{\star 2}-p_{B}^{* 2}}$ and $\Delta E=E_{B}^{*}-E_{\text {beam }}^{\star}$
- Use 8 bagged decision trees with 10 input variables to separate signal from $B \bar{B}$ and $q \bar{q}$ backgrounds for low/high $q^{2}$ and $e^{+} e^{-} / \mu^{+} \mu^{-}$separately

| $q^{2}$ bin | $q^{2} \min \left(\mathrm{GeV}^{2} / c^{4}\right)$ | $q^{2} \max \left(\mathrm{GeV}^{2} / c^{4}\right)$ |
| :---: | :---: | :---: |
| $q_{1}^{2}$ | 0.10 | 2.00 |
| $q_{2}^{2}$ | 2.00 | 4.30 |
| $q_{3}^{2}$ | 4.30 | 8.12 |
| $q_{4}^{2}$ | 10.11 | 12.89 |
| $q_{5}^{2}$ | 14.21 | $\left(m_{B}-m_{K^{*}}\right)^{2}$ |
| $q_{0}^{2}$ | 1.00 | 6.00 |

- Combine $B \bar{B}$ BDT outputs into likelihood ratios:

$$
L_{R}=\frac{P_{s i g}}{P_{s i g}+P_{b k g}} \rightarrow \text { require } L_{R}>0.6
$$

- Initially, perform 3-d unbinned maximum-likelihood fit to $m_{E S,} m_{K \pi}, L_{R}$ in each $q^{2}$ bin for each signal mode separately requiring $m_{E S}>5.2 \mathrm{GeV}$
$\rightarrow$ fix normalizations and pdfs for $m_{E S,}, m_{K \pi}, L_{R}$
G. Eigen, EPS17 Venice, 06/07/2017

## Determination of Angular Observables

- In each $q^{2}$ bin for each signal mode separately define normalizations and pdfs for $m_{E S}$, $m_{K \pi}, L_{R}$ in angular-fit signal region ( $m_{E S}>5.27 \mathrm{GeV}$ ) using results from prior fits
- Add $\cos \theta_{K}$ as $4^{\text {th }}$ variable in likelihood function with $\mathcal{F}_{L}\left(\boldsymbol{q}^{2}\right)$ as only free parameter keeping all other parameters fixed
- Add $\cos \theta_{\ell}$ as $4^{\text {th }}$ variable in likelihood function with $\mathcal{A}_{F B}\left(q^{2}\right)$ as only free parameter keeping all other parameters and $\mathcal{F}_{L}\left(q^{2}\right)$ fixed
- Determine each angular result subsequently by direct construction and examination of $\log (\mathrm{L})$ curves from scan across entire $\mathcal{F}_{L}\left(q^{2}\right)$ and $\mathcal{A}_{F B}\left(q^{2}\right)$ parameter space
- Use signal classes: correctly reconstructed, mis-reconstructed (cross feed) events Use background classes: combinatorial, leakage from $\mathrm{J} / \psi, \psi(2 \mathrm{~S})$ region (vetoed), hadrons misidentified as muons
Fit projections for $B^{0} \rightarrow K^{+}\left(\rightarrow K^{+} \pi^{-}\right) e^{+} e^{-}$

G. Eigen, EPS17 Venice, 06/07/2017

## $B \rightarrow K^{*} \ell^{+} \ell^{-}$Angular Fit Projections

- Angular fit projections for bin $\mathrm{q}^{2}{ }_{0}$ (1-6 GeV${ }^{2}$ )

## $\mathcal{F}_{L}\left(q^{2}\right)$ and $\mathcal{A}_{F B}\left(q^{2}\right)$ Measurements

- BABAR $\mathcal{F}_{L}\left(q^{2}\right)$ :
for $\mathrm{q}^{2}$ \& $\mathrm{q}^{2}{ }_{3}$ see $3 \sigma$ \& $2 \sigma$ deviations from the SM; values are lower for $B^{+} \rightarrow K^{*} \ell^{+} \ell^{-}$ than for $B^{0} \rightarrow K^{*} \ell^{+} \ell^{-}$

- BABAR $\mathcal{A}_{F B}\left(q^{2}\right)$ : agrees well with the SM except for $q^{2}{ }_{2}$ bin that shows $>2 \sigma$ deviation; values for $B^{+} \rightarrow K^{+} \ell^{+} \ell^{-}$ agree with those of
$B^{0} \rightarrow K^{*} \ell^{+} \ell^{-}$

Belle: PRL 103, 171801 (2012) CDF: PRL 108, 081807 (2012)
LHCb: JHEP1308, 131 (2013)

CMS: PLB 727, 77 (2013)
$q^{2}$ ATLAS: ATLAS-CONF 2013-038 (2013) BABAR: PRD 93, no 5, 052015 (2016)

## $\mathcal{F}_{L}\left(q^{2}\right)$ and $\mathcal{A}_{F B}\left(q^{2}\right)$ Measurements

- $\mathcal{F}_{L}\left(q^{2}\right)$ : new LHCb results are consistent with those of the SM
- $\mathcal{A}_{F B}\left(q^{2}\right):$ new LHCb results are in good agreement with the SM predictions

## Comparison of $\mathcal{F}_{L}$ and $\mathcal{A}_{F B}$ for $\operatorname{Bin} q^{2}{ }_{0}$

- In bin $\mathrm{q}^{2}{ }_{0}$, BABAR results for $\mathcal{F}_{L}$ are substantially lower than the SM prediction
$\rightarrow$ deviation is $>3 \sigma$
- BABAR results for $\mathcal{A}_{F B}$ agree with the SM prediction, as do those of other experiments

Belle: PRL 103, 171801 (2012)
CDF: PRL 108, 081807 (2012)

LHCb: JHEP1308, 131 (2013)
CMS: PLB 727, 77 (2013)

ATLAS: ATLAS-CONF 2013-038 (2013)
BABAR: PRD 93, no 5, 052015 (2016)

## Results for $\mathrm{P}_{2}$

- Extract $P_{2}$ from the angular fit results
- In bin $\mathrm{q}^{2}{ }_{2}$, see $>2 \sigma$ discrepancy with the SM prediction
- In bin $\mathrm{q}^{2}{ }_{0}, \mathrm{P}_{2}=0.11 \pm 0.10$

$$
P_{2}\left(q^{2}\right)=-\frac{2}{3} \frac{\mathcal{A}_{F B}}{1-\mathcal{F}_{L}}
$$

BABAR: PRD 93, no 5, 052015 (2016)

## Search for $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \tau^{+} \tau^{-}$

## Analysis Methodology

- Use the full BABAR data set of $471 \times 10^{6} B \bar{B}$ events
- Tag one $B$ meson via full hadronic reconstruction and look for $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \tau^{+} \tau^{-}$in the recoil
- Hadronic $B_{t a g} \rightarrow X_{c} X$ reconstruction:

$\left.X_{c}=D^{(*) 0} \pi, D^{(*) \pm}, D_{s}{ }^{*}\right), J / \psi \& X=$ combination of $5 \pi$ and/or K
- Use purely leptonic decays of both $\tau$ 's
- Main background:

- $\mathrm{B}_{\text {signal }}$ selection:
- Exactly 3 tracks with correct PID
- $\mathrm{m}_{\mathrm{ES}}>5.27 \mathrm{GeV}^{2}$
- $\mathrm{E}_{\text {sig }}$ miss $>0 \mathrm{GeV}$
- Reduce continuum background with Multi-Layer Perceptron NN using 6 event shape variables inserted into likelihood ratio

$$
\mathcal{L}=\frac{P_{B}}{P_{B}+P_{q}}>0.5
$$

$$
P_{B}=\Pi_{i} P_{B}\left(x_{i}\right) \text { : probability for } B \bar{B}
$$

$$
P_{q}=\Pi_{i} P_{q}\left(x_{i}\right): \text { probability for } q \bar{q}
$$

- Removes $75 \%$ of $q \bar{q}$ background while retaining $80 \%$ of $B \bar{B}$ (signal+background) events

## Final Selection and Results

- Define another MLP NN using 8 event shape variables to reduce $B \bar{B}$ bkg peaking background
- Select MLP > $0.7(0.75)$ for $\mathrm{e}^{+} \mathrm{e}^{-}, \mu^{+} \mu^{-}(\mathrm{e} \mu)$
- Remaining peaking backgrounds: $84 \%$ (correct B-tag, $m_{E s}$ peaks at right mass)
- Cross check of $\mathrm{B}_{\mathrm{tag}}$ signal with $B^{+} \rightarrow D^{0} \ell^{+} v_{\ell}\left(D^{0} \rightarrow K^{-} \pi^{+}\right)$ before MLP output requirement $\rightarrow$ good agreement

- Systematic uncertainties:
- PID: $\mathrm{e}^{+} \mathrm{e}^{-}: 5 \%, \mu^{+} \mu^{-}: 7 \%$, e $\mu: 5 \%$
- $\pi^{0}$ veto: $3 \%$
- MLP NN: $2.6 \%$
- $\mathrm{B}_{\text {tag }}$ : efficiency $1.2 \%$, background estimate $1.6 \%$
- Theory 3\%
- Observed yield: $176 \pm 13$ events
- Set branching fraction upper limit $\mathcal{B}\left(B^{+} \rightarrow K^{+} \tau^{+} \tau^{-}\right)=2.25 \times 10^{-3} @ 90 \% \mathrm{CL}$
G. Eigen, EPS17 Venice, 06/07/2017

|  | $e^{+} e^{-}$ | $\mu^{+} \mu^{-}$ | $e^{+} \mu^{-}$ |
| :--- | :---: | :---: | :---: |
| $N_{\mathrm{bkg}}^{i}$ | $49.4 \pm 2.4 \pm 2.9$ | $45.8 \pm 2.4 \pm 3.2$ | $59.2 \pm 2.8 \pm 3.5$ |
| $\epsilon_{\mathrm{sig}}^{i}\left(\times 10^{-5}\right)$ | $1.1 \pm 0.2 \pm 0.1$ | $1.3 \pm 0.2 \pm 0.1$ | $2.1 \pm 0.2 \pm 0.2$ |
| $N_{\text {obs }}^{i}$ | 45 | 39 | 92 |
| Significance $(\sigma)$ | -0.6 | -0.9 | 3.7 |

## Conclusions

- We measured the angular distributions of $B^{+} \rightarrow K^{+} \ell^{+} \ell^{-}$and $B^{0} \rightarrow K^{*} \ell^{+} \ell^{-}$extracting $\mathcal{F}_{L}\left(q^{2}\right)$, $\mathcal{A}_{F B}\left(q^{2}\right)$ and $P_{2}$ in five disjoint bins of $q^{2}$ and $q^{2}{ }_{0}$
- $\mathcal{F}_{L}\left(q^{2}\right)$ for $\mathrm{K}^{*+}$ shows larger deviations from the SM prediction than that for $\mathrm{K}^{* 0}$
- For $K^{*}$ combination, $\mathcal{F}_{L}\left(q^{2}\right)$ deviates from the SM prediction in bins $q^{2}{ }_{2}(\geq 3 \sigma)$ and $q^{2}{ }_{3}$ $(\geq 2 \sigma)$
- For $K^{*}$ combination, $\mathcal{A}_{F B}\left(q^{2}\right)$ deviates from the $S M$ prediction in bin $q^{2}{ }_{2}(\geq 2 \sigma)$
- For $K^{*}$ combination, $P_{2}$ deviates from the $S M$ prediction in bin $q^{2}{ }_{2}(\geq 2 \sigma)$
- World averages for $\mathcal{F}_{L}\left(q^{2}\right)$ and $\mathcal{A}_{F B}\left(q^{2}\right)$ do not show large deviations from the SM predictions
- We searched for $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \tau^{+} \tau^{-}$and set a branching fraction upper limit of

$$
\mathcal{B}\left(B^{+} \rightarrow K^{+} \tau^{+} \tau^{-}\right)=2.25 \times 10^{-3} @ 90 \% \mathrm{CL}
$$
