## The CMS Tracker upgrade for HL-LHC

*Saturday, July 8, 2017 9:15 AM (15 minutes)*

The LHC machine is planning an upgrade program which will smoothly bring the luminosity at about  $5 \cdot 10^{34} \text{cm}^{-2}\text{s}^{-1}$  in 2028, to possibly reach an integrated luminosity of  $3000 \text{fb}^{-1}$  by the end of 2037. This High Luminosity LHC scenario, HL-LHC, will require a preparation program of the LHC detectors known as Phase-2 upgrade. The current CMS Outer Tracker, already running beyond design specifications, and CMS Phase1 Pixel Detector will not be able to survive HL-LHC radiation conditions and CMS will need completely new devices, in order to fully exploit the high-demanding operating conditions and the delivered luminosity. The new Outer Tracker should have also trigger capabilities. To achieve such goals, R&D activities are ongoing to explore options either for the Outer Tracker, either for the pixel Inner Tracker. Solutions are being developed that would allow including tracking information at Level-1. The design choices for the Tracker upgrades are discussed along with some highlights of the R&D activities.
