## Progress in higher order CGC computations

Initial Stages in High Energy Nuclear Collisions

Lisbon, Portugal
23-27 May 2016

Dionysios Triantafyllopoulos ECT*/FBK, Trento, Italy

## Outline

* BK equation at order $\alpha^{2}$ and large transverse logarithms
* Unphysical solutions
* Resummation of logarithms to all orders
- Restoration of stability and solutions
* Fits to HERA data, outlook

## CGC and BK in Heavy Ion Collisions

* CGC: high energy evolution of hadronic wave function
* Best d.o.f. : Wilson lines for projectile partons scattering
* Cross section in DIS, single / double particle production at forward rapidity in pA collisions, energy density just after an AA collision, ... :
Local in rapidity observables: correlators of Wilson lines.
* To excellent accuracy, all such correlators expressed in terms of dipole scattering. BK equation.

## Diagrams for dipole evolution

## * LO

* $\mathrm{NLO} \mathrm{N}_{\mathrm{f}}$

* $\mathrm{NLO} \mathrm{N}_{\mathrm{c}}$

* Right mover. Lower $\mathrm{k}^{+}$longitudinal momentum.

## The BK equation at NLO ${ }_{\text {balists, Chirinios }}$

$$
\begin{gathered}
\frac{\mathrm{d} S_{12}}{\mathrm{~d} Y}=\frac{\bar{\alpha}_{s}}{2 \pi} \int \mathrm{~d}^{2} z_{3} \frac{z_{12}^{2}}{z_{13}^{2} z_{23}^{2}}\left[1+\bar{\alpha}_{s}\left(\bar{b} \ln z_{12}^{2} \mu^{2}-\bar{b} \frac{z_{13}^{2}-z_{23}^{2}}{z_{12}^{2}} \ln \frac{z_{13}^{2}}{z_{23}^{2}}+\frac{67}{36}-\frac{\pi^{2}}{12}-\frac{5}{18} \frac{N_{\mathrm{f}}}{N_{\mathrm{c}}}\right.\right. \\
\left.\left.-\frac{1}{2} \ln \frac{z_{13}^{2}}{z_{12}^{2}} \ln \frac{z_{23}^{2}}{z_{12}^{2}}\right)\right]\left(S_{13} S_{32}-S_{12}\right) \\
+\frac{\bar{\alpha}_{s}^{2}}{8 \pi^{2}} \int \frac{\mathrm{~d}^{2} z_{3} \mathrm{~d}^{2} z_{4}}{z_{34}^{4}}\left[-2+\frac{z_{13}^{2} z_{24}^{2}+z_{14}^{2} z_{23}^{2}-4 z_{12}^{2} z_{34}^{2}}{z_{13}^{2} z_{24}^{2}-z_{14}^{2} z_{23}^{2}} \ln \frac{z_{13}^{2} z_{24}^{2}}{z_{14}^{2} z_{23}^{2}}\right. \\
\left.+\frac{z_{12}^{2} z_{34}^{2}}{z_{13}^{2} z_{24}^{2}}\left(1+\frac{z_{12}^{2} z_{34}^{2}}{z_{13}^{2} z_{24}^{2}-z_{14}^{2} z_{23}^{2}}\right) \ln \frac{z_{13}^{2} z_{24}^{2}}{z_{14}^{2} z_{23}^{2}}\right] \\
{\left[S_{13} S_{34} S_{42}-\frac{1}{2 N_{\mathrm{c}}^{3}} \operatorname{tr}\left(V_{1} V_{3}^{\dagger} V_{4} V_{2}^{\dagger} V_{3} V_{4}^{\dagger}\right)-\frac{1}{2 N_{\mathrm{c}}^{3}} \operatorname{tr}\left(V_{1} V_{4}^{\dagger} V_{3} V_{2}^{\dagger} V_{4} V_{3}^{\dagger}\right)-S_{13} S_{32}+\frac{1}{N_{\mathrm{c}}^{2}} S_{12}\right]} \\
+\frac{\bar{\alpha}_{s}^{2}}{8 \pi^{2}} \frac{N_{\mathrm{f}}}{N_{\mathrm{c}}} \int \frac{\mathrm{~d}^{2} z_{3} \mathrm{~d}^{2} z_{4}}{z_{34}^{4}}\left[2-\frac{z_{13}^{2} z_{24}^{2}+z_{14}^{2} z_{23}^{2}-z_{12}^{2} z_{34}^{2}}{z_{13}^{2} z_{24}^{2}-z_{14}^{2} z_{23}^{2}} \ln \frac{z_{13}^{2} z_{24}^{2}}{z_{14}^{2} z_{23}^{2}}\right] \\
{\left[S_{14} S_{32}-\frac{1}{N_{\mathrm{c}}^{3}} \operatorname{tr}\left(V_{1} V_{2}^{\dagger} V_{3} V_{4}^{\dagger}\right)-\frac{1}{N_{\mathrm{c}}^{3}} \operatorname{tr}\left(V_{1} V_{4}^{\dagger} V_{3} V_{2}^{\dagger}\right)+\frac{1}{N_{\mathrm{c}}^{2}} S_{12} S_{34}-S_{13} S_{32}+\frac{1}{N_{\mathrm{c}}^{2}} S_{12}\right]} \\
z_{i j}=z_{i}-z_{j} \quad S_{i j}=\frac{1}{N_{\mathrm{c}}} \operatorname{tr}\left(V_{i}^{\dagger} V_{j}\right) \quad V_{i}^{\dagger}=\mathrm{P} \exp \left[\mathrm{i} g \int \mathrm{~d} z^{+} A_{a}^{-}\left(z^{+}, z_{i}\right) t^{a}\right] \quad \bar{b}=\frac{11}{12}-\frac{1}{6} \frac{N_{\mathrm{f}}}{N_{\mathrm{c}}}
\end{gathered}
$$

$$
\text { See also Kovner, Lublinsky, Mulian } 14
$$

## Large transverse logs

*Strongly ordered large "perturbative" dipoles (DLA)

$$
1 / Q_{s} \gg z_{14} \simeq z_{24} \simeq z_{34} \gg z_{13} \simeq z_{23} \gg z_{12}
$$

* Large dipoles interact stronger, real terms only ( $\mathrm{N}_{\mathrm{f}}=0$ )

$$
\frac{\mathrm{d} T_{12}}{\mathrm{~d} Y}=\bar{\alpha}_{s} \int_{z_{12}^{2}}^{1 / Q_{s}^{2}} \mathrm{~d} z_{13}^{2} \frac{z_{12}^{2}}{z_{13}^{4}}\left(1-\bar{\alpha}_{s} \frac{1}{2} \ln ^{2} \frac{z_{13}^{2}}{z_{12}^{2}}-\bar{\alpha}_{s} \frac{11}{12} \ln \frac{z_{13}^{2}}{z_{12}^{2}}\right) T_{13}
$$

* NLO $>$ LO, unstable expansion in coupling.

Simple but general IC: color transparency + saturation
$T_{12}=\left\{\begin{array}{l}z_{12}^{2} Q_{s 0}^{2}, z_{12} Q_{s 0} \ll 1 \\ 1\end{array}, z_{12} Q_{s 0} \gg 1 \Rightarrow \frac{\Delta T_{12}}{\bar{\alpha}_{s} \Delta Y} \simeq z_{12}^{2} Q_{s 0}^{2}\left(\ln \frac{1}{z_{12}^{2} Q_{s 0}^{2}}-\frac{\bar{\alpha}_{s}}{6} \ln ^{3} \frac{1}{z_{12}^{2} Q_{s 0}^{2}}-\frac{11 \bar{\alpha}_{s}}{24} \ln ^{2} \frac{1}{z_{12}^{2} Q_{s 0}^{2}}\right)\right.$

## Unstable numerical solutions

Avsar, Stasto, DT, Zaslavsky 11

Higher order CGC computations

Lappi, Mantysaari 15

D. Triantafyllopoulos, $\mathrm{ECT}^{*} / \mathrm{FBK}$

## Two gluons and time ordering (kinematics)

* Hard to soft projectile evolution $\boldsymbol{k} \ll \boldsymbol{p}$ and $k^{+} \ll p^{+}$
* Energy denominators lead to largest logs when emissions are time-ordered $\tau_{k} \approx k^{+} z_{4}^{2} \ll \tau_{p} \approx p^{+} z_{3}^{2}$
* Leads to double log term in NLO BK equation
$\Delta T_{12}=\bar{\alpha}_{s}^{2} \int \frac{\mathrm{~d} p^{+}}{p^{+}} \frac{\mathrm{d} k^{+}}{k^{+}} \Theta\left(p^{+} \frac{z_{3}^{2}}{z_{4}^{2}}-k^{+}\right) \mathrm{d} z_{3}^{2} \mathrm{~d} z_{4}^{2} \frac{z_{12}^{2}}{z_{3}^{2} z_{4}^{4}} T\left(z_{4}\right) \rightarrow-\frac{\bar{\alpha}_{s}^{2} \Delta Y}{2} \int_{z_{12}^{2}}^{1 / Q_{s}^{2}} \frac{\mathrm{~d} z_{2}^{2}}{z_{4}^{4}} \ln ^{2} \frac{z_{4}^{2}}{z_{12}^{2}} T\left(z_{4}\right)$

## Resummation of double logs in DLA

* Systematically resum to all orders in non-local equation $\frac{\mathrm{d} T\left(Y, z_{12}^{2}\right)}{\mathrm{d} Y}=\bar{\alpha}_{s} \int_{z_{12}^{2}}^{1 / Q_{s}^{2}} \frac{\frac{2}{2}}{z_{13}^{2}} z_{12}^{2} \frac{z_{12}^{2}}{z_{13}^{2}} \Theta\left(Y-\ln \frac{z_{13}^{2}}{z_{12}^{2}}\right) T\left(Y-\ln \frac{z_{13}^{2}}{z_{12}^{2}}, z_{13}^{2}\right)$
*Mathematically equivalent to local equation
with modified initial condition (impact factor)

$$
T\left(0, z_{12}^{2}\right) \propto \frac{C_{\mathrm{F}}}{N_{\mathrm{c}}} z_{12}^{2} Q_{s 0}^{2} \sqrt{\bar{\alpha}_{s}} \mathrm{~J}_{1}\left(2 \sqrt{\bar{\alpha}_{s} \ln ^{2} \frac{1}{z_{12}^{2} Q_{s 0}^{2}}}\right)
$$

## Resummation of double logs in BK

* Promote local equation to include BK physics

$$
\begin{gathered}
\frac{\mathrm{d} S_{12}}{\mathrm{~d} Y}=\frac{\bar{\alpha}_{s}}{2 \pi} \int \mathrm{~d}^{2} z_{3} \frac{z_{12}^{2}}{z_{13}^{2} z_{23}^{2}} \frac{\mathrm{~J}_{1}\left(2 \sqrt{\bar{\alpha}_{s} L_{13} L_{23}}\right)}{\sqrt{\bar{\alpha}_{s} L_{13} L_{23}}}\left(S_{13} S_{32}-S_{12}\right) \\
\text { with } L_{13} L_{23}=\ln \frac{z_{13}^{2}}{z_{12}^{2}} \ln \frac{z_{23}^{2}}{z_{12}^{2}}
\end{gathered}
$$

Equivalent non-local equation by Beuf 14

* NLO BK (double log term) when truncated to order $\bar{\alpha}_{s}^{2}$
* Exactly resums double log terms to all orders

## Numerical solution

BFKL on $z_{12}^{2 \gamma} \equiv r^{2 \gamma}$

$\omega_{\mathrm{LO}}=\frac{\bar{\alpha}_{s}}{\gamma}+\frac{\bar{\alpha}_{s}}{1-\gamma}+$ finite $\quad \omega_{\mathrm{NLO}}=\frac{\bar{\alpha}_{s}}{\gamma}+\frac{\bar{\alpha}_{s}}{1-\gamma}-\frac{\bar{\alpha}_{s}^{2}}{(1-\gamma)^{3}}+$ finite
$\omega_{\mathrm{NLO}}^{\mathrm{res}}=\omega_{\mathrm{NLO}}-\frac{\bar{\alpha}_{s}}{1-\gamma}+\frac{\bar{\alpha}_{s}^{2}}{(1-\gamma)^{3}}+\frac{1}{2}\left[-(1-\gamma)+\sqrt{(1-\gamma)^{2}+4 \bar{\alpha}_{s}}\right]+$ finite

## Numerical solution

* Considerable speed reduction, roughly factor of $1 / 2$

## Single log in quark contribution (dynamics)

* Take $\boldsymbol{k} \ll \boldsymbol{p}$ and $\zeta=k^{+} / p^{+} \ll 1$ hard to soft projectile evolution
* Quark contribution is easier, no DLs
* Integrate transverse momenta

$$
\Sigma \mathcal{A}_{i j}=\frac{\alpha_{s}^{2} N_{\mathrm{f}}}{2 \pi^{4}} \Delta Y \int_{0}^{1} \mathrm{~d} \zeta \frac{z_{12}^{2}}{z_{4}^{2}} \frac{z_{3}^{4}+\zeta^{2} z_{4}^{4}}{\left(z_{3}^{2}+\zeta z_{4}^{2}\right)^{4}} \simeq \frac{\alpha_{s}^{2} N_{\mathrm{f}}}{3 \pi^{4}} \Delta Y \frac{z_{12}^{2}}{z_{3}^{2} z_{4}^{4}}
$$

- $\zeta z_{4}^{2} \sim z_{3}^{3}$, no time ordering. Integrand $P_{q G}$ split. function
* Insert color structure and scattering
$\frac{\Delta T_{12}}{\Delta Y}=-\frac{\bar{\alpha}_{s}^{2} N_{\mathrm{f}}}{6 N_{\mathrm{c}}^{3}} z_{12}^{2} \int_{z_{12}^{2}}^{1 / Q_{s}^{2}} \frac{\mathrm{~d} z_{4}^{2}}{z_{4}^{4}} \ln \frac{z_{4}^{2}}{z_{12}^{2}} T\left(z_{4}\right)$
Higher order CGC computations

## Relationship to splitting functions

* DGLAP mixes quarks and gluons. Largest eigenvalue of moments:

$$
\int_{0}^{1} \mathrm{~d} z z^{\omega}\left[P_{G G}(z)+\frac{C_{\mathrm{F}}}{N_{\mathrm{c}}} P_{q G}(z)\right]=\frac{1}{\omega} \underbrace{-\frac{11}{12}-\frac{N_{\mathrm{f}}}{6 N_{\mathrm{c}}^{3}}}_{\equiv A_{1}}+\mathcal{O}(\omega)
$$

* Similar hard to soft gluon diagrams must give -11/12
* All this is DGLAP physics. "Normally" it is soft to hard.

## Soft to hard

* Imagine starting from LM target parton with large $q_{0}^{-}$ Evolve up to small projectile by emitting partons with smaller size and smaller minus long. momentum.

## DGLAP solution and collinear BK kernel

* General DGLAP solution

$$
T_{12}(Y) \approx z_{12}^{2} Q_{0}^{2} x G\left(\eta, \ln \frac{1}{z_{12}^{2} Q_{0}^{2}}\right) \approx \int \frac{\mathrm{d} \omega}{2 \pi \mathrm{i}} \exp \{\omega Y+[\underbrace{\bar{\alpha}_{s} \mathcal{P}(\omega)-\omega-1}_{-\gamma}] \ln \frac{1}{z_{12}^{2} Q_{0}^{2}}\}
$$

* Solve for $\omega$ as function of $\gamma$. Keep only up to $A_{1}$. One, two, three, ... subleading splittings resummed. Exponential combinatorics.
$\frac{\mathrm{d} S_{12}}{\mathrm{~d} Y}=\frac{\bar{\alpha}_{s}}{2 \pi} \int \mathrm{~d}^{2} z_{3} \frac{z_{12}^{2}}{z_{13}^{2} z_{23}^{2}}\left(\frac{z_{12}^{2}}{z_{>}^{2}}\right)^{\mp \bar{\alpha}_{s} A_{1}} \frac{\mathrm{~J}_{1}\left(2 \sqrt{\bar{\alpha}_{s} L_{13} L_{23}}\right)}{\sqrt{\bar{\alpha}_{s} L_{13} L_{23}}}\left(S_{13} S_{32}-S_{12}\right)$
$z_{<}=\min \left\{z_{13}, z_{23}\right\} .+$ sign when $z_{<}<z_{12}$

## Running coupling

$$
\frac{\mathrm{d} S_{12}}{\mathrm{~d} Y}=\frac{\bar{\alpha}_{s}(\mu)}{2 \pi} \int \mathrm{~d}^{2} z_{3} \frac{z_{12}^{2}}{z_{13}^{2} z_{23}^{2}}\left[1+\bar{\alpha}_{s}(\mu)\left(\bar{b} \ln z_{12}^{2} \mu^{2}-\bar{b} \frac{z_{13}^{2}-z_{23}^{2}}{z_{12}^{2}} \ln \frac{z_{13}^{2}}{z_{23}^{2}}\right)\right]\left(S_{13} S_{32}-S_{12}\right)
$$

* Choose $\mu$ to cancel potentially large log in all regions Large daughter dipoles : $\mu \approx 1 / z_{12}$ Small daughter dipole : $\mu \approx 1 / \min \left\{z_{13}, z_{23}\right\}$ In general : $\mu \approx 1 / \min \left\{z_{i j}\right\} \quad \checkmark$ Hardest scale
* Balitsky-prescription: $\checkmark$, albeit unphysical slow
* Choose coefficient of $\bar{b}$ to vanish: $\checkmark$

$$
\alpha_{s}=\left[\frac{1}{\alpha_{s}\left(z_{12}\right)}+\frac{z_{13}^{2}-z_{23}^{2}}{z_{12}^{2}} \frac{\alpha_{s}\left(z_{13}\right)-\alpha_{s}\left(z_{23}\right)}{\alpha_{s}\left(z_{13}\right) \alpha_{s}\left(z_{23}\right)}\right]^{-1}
$$

* No anomalous dimension in initial condition
* Including single logs: more physical parameters
* MV model: can be extrapolated to higher $\mathrm{Q}^{2}$
* Smallest dipole prescription: best fit B-prescription: not very good

## Conclusion - Outlook

* Stable, slow, evolution with resumed dominant logs
* Insert formalism into more exclusive observables e.g. particle production at forward rapidity
- Write a Langevin equation?
* Understand better hard to soft DGLAP evolution?
