Indirect dark matter searches: current status and perspectives

Wednesday, 14 September 2016 11:30 (30 minutes)

Many theoretical ideas for the particle nature of dark matter exist. The most popular models often predict that dark matter particles self-annihilate or decay, giving rise to potentially detectable signatures in astronomical observations. I will summarize the current status of searches for such signatures and critically reassess recent claims for dark matter signals. I will further provide an outlook on anticipated developments in the next 10 years, and discuss new methods to facilitate strategy development.

Summary

Presenter: WENIGER, Christoph (University of Amsterdam)
Session Classification: Plenary
