0

# Introduction

- **ITS alignment – need of *good* quality tracks in order to avoid biases → display, complementary to the statistical tools**
  - clusters isolation
  - assignment ambiguities
  - tracking or geometry (potential) bugs
- **Scale of the misalignment effects: tens- hundreds of microns → zooming → precision geometry representation**
- **Playing with different re-alignments → interactivity**
- **Simple direct *measurements*, QA type plots**
- **Few simple examples of practical use → next slides**

# Evident problem: RUN 61418 event 44

No clear clusters – track assignment

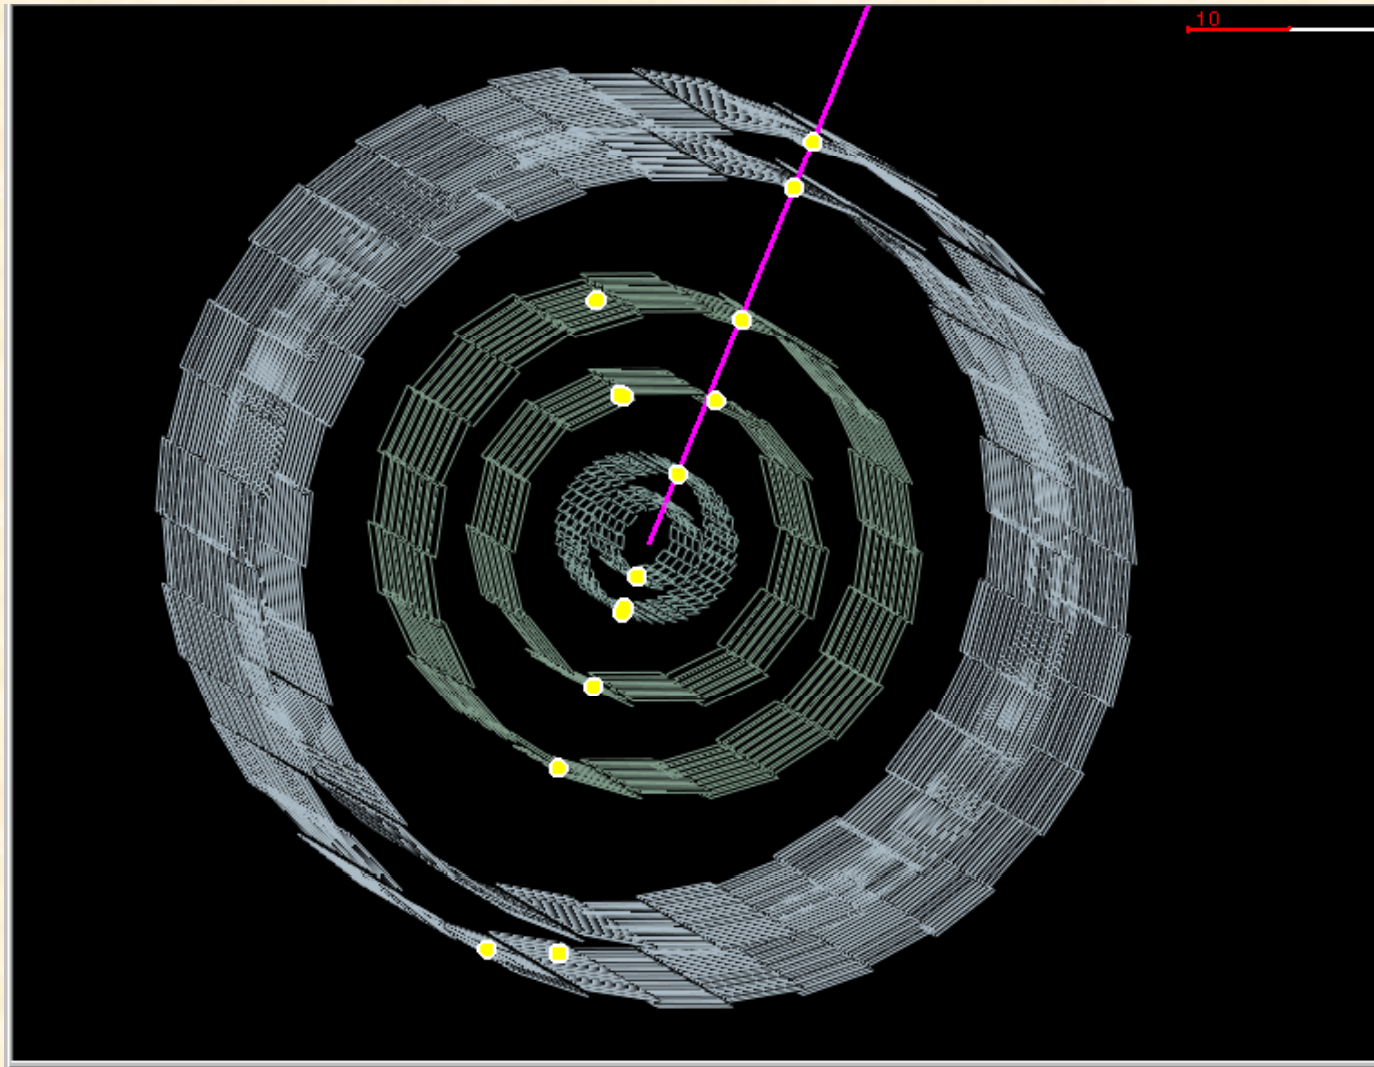

# Another example - RUN 61418 event 88

Problem of cleaning ESD ?  
Fake tracks have only 2 SSD assigned clusters (each)

# Another example - RUN 62276 ev 958

Evident track with  
3 (yes) SPD clusters  
Plus SSD, but  
not reconstructed

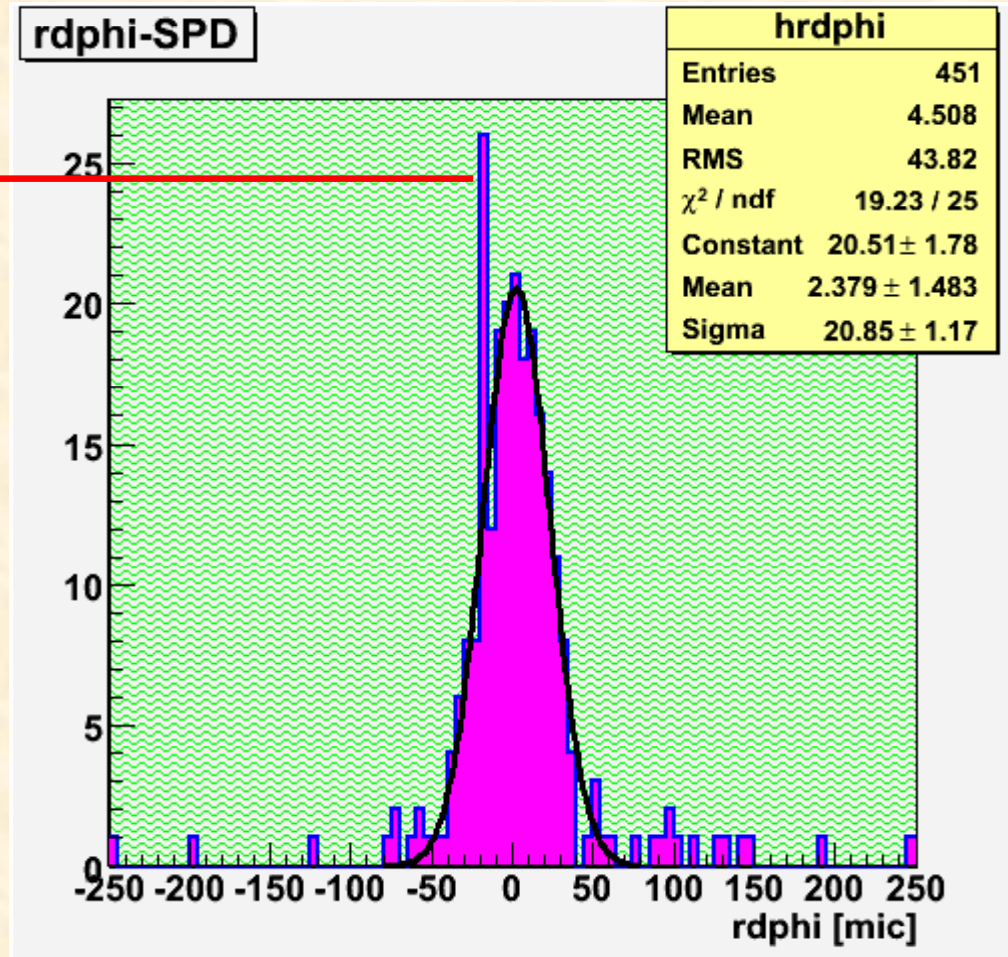

# Case study – hunting ghost clusters in SPD

Rdphi distance of the overlap clusters  
after re-alignment

All events contributing  
to this peak scanned with  
AliEve  
→ No apparent anomaly  
found !  
Numerical arte-fact of  
alignment procedure (?)  
Goes away with change  
of alignment

# Run 61418 event 1143 – double contributor (to the spike)

Simple alieve:  
user's geometry  
and alignment.  
All 4 SPD clusters  
used in tracking

# ReadESDfriend information

(out of AliEve)

```
Event number: 1143
Number of tracks: 2
Number of friend tracks: 2
Track number 0
  Number of TPC clusters: 2
  Index of the 1st TPC cluster: -1270338736
  ITS cluster map (from SPDs to SSDs):
  Bit 0: 1
  Bit 1: 1
  Bit 2: 0
  Bit 3: 0
  Bit 4: 1
  Bit 5: 1
  Number of track points: 6
  X coordinate of the 1st track point: -36,3034
  Y coordinate of the 1st track point: 22,8503
  Z coordinate of the 1st track point: -26,8642
  R of the 1st track point: 50,6138
volIID1-6: 12682 10543 4163 2083 2087 4167
Number of friend tracks: 2
Track number 1
  Number of TPC clusters: 6
  Index of the 1st TPC cluster: -1270338736
  ITS cluster map (from SPDs to SSDs):
  Bit 0: 1
  Bit 1: 1
  Bit 2: 0
  Bit 3: 0
  Bit 4: 1
  Bit 5: 1
  Number of track points: 4
  X coordinate of the 1st track point: 35,432
  Y coordinate of the 1st track point: -25,3048
  Z coordinate of the 1st track point: 3,94276
  R of the 1st track point: 43,7184
volIID1-6: 13149 10910 4235 2115 16 0
```

SPD and SSD clusters used in the track fit (ITS map)

6 clusters, 2 doubles!

??

# Run 61418 event 1143 – no realignment

Zoom of one  
of the 2 overlaps

NOTE: track  
reconstructed  
with the  
aligned geometry,  
clusters not  
aligned

# Run 61418 event 1143 – with realignment

NOTE: strange drawing of modules by its\_digits.C macro

- TGeo overlaps created when realigning

# Run 61418 event 1143 – alieve init zoom

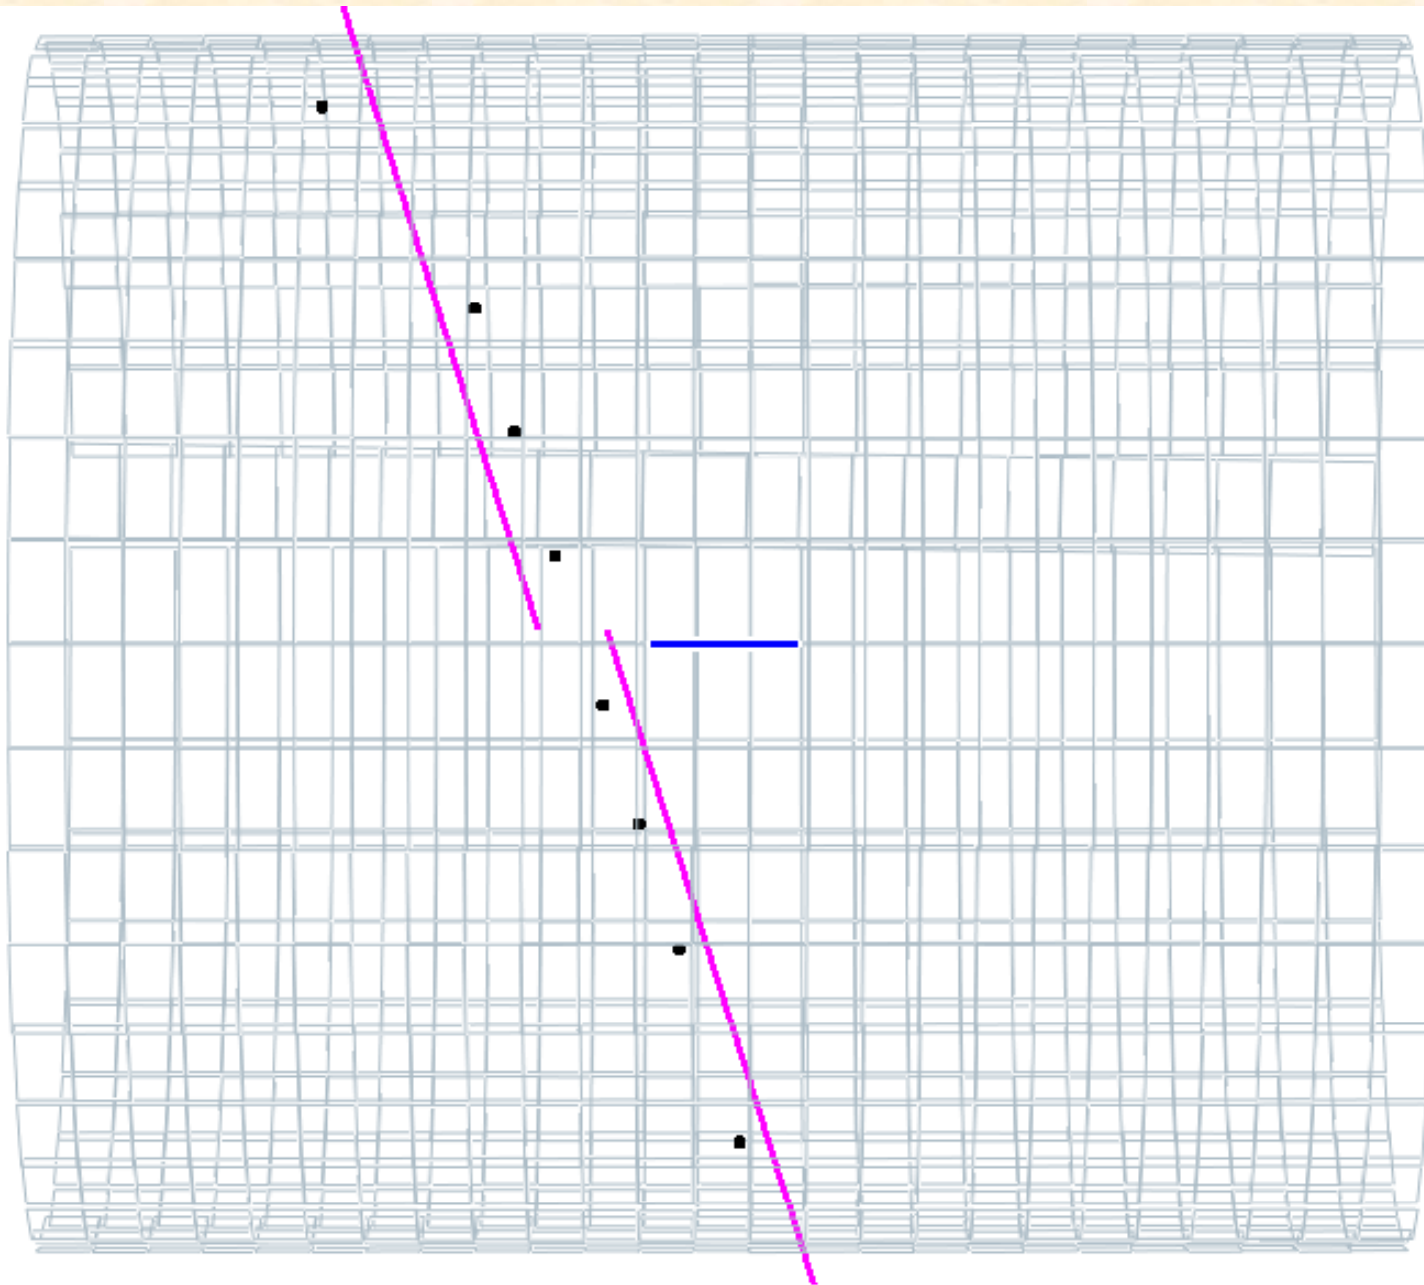

Max zoom in YZ projection

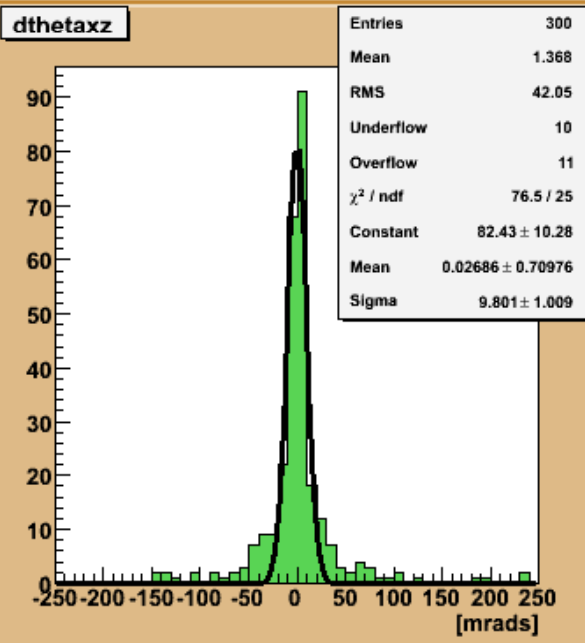

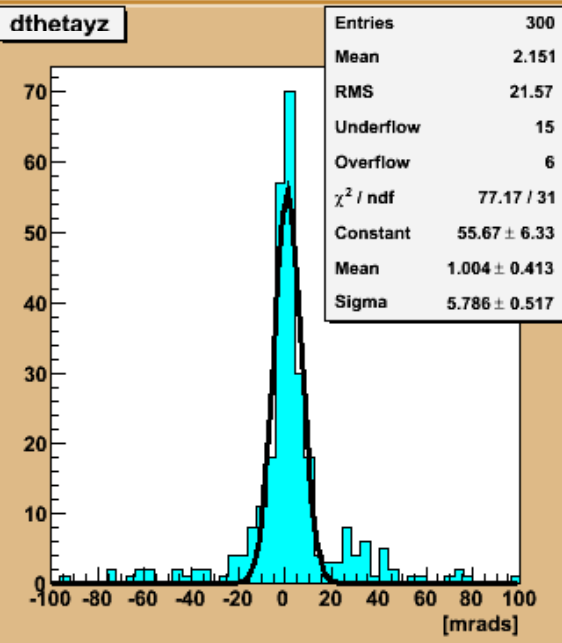

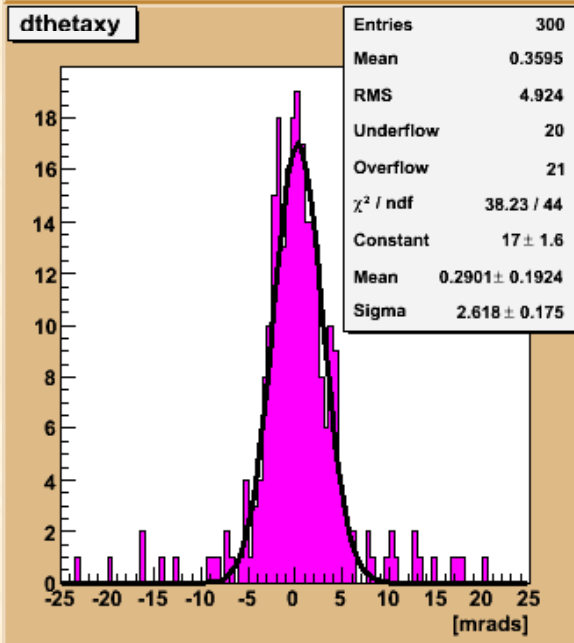

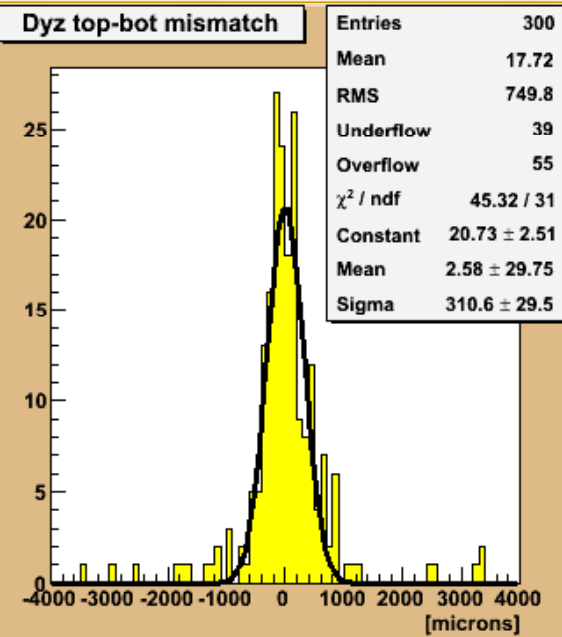

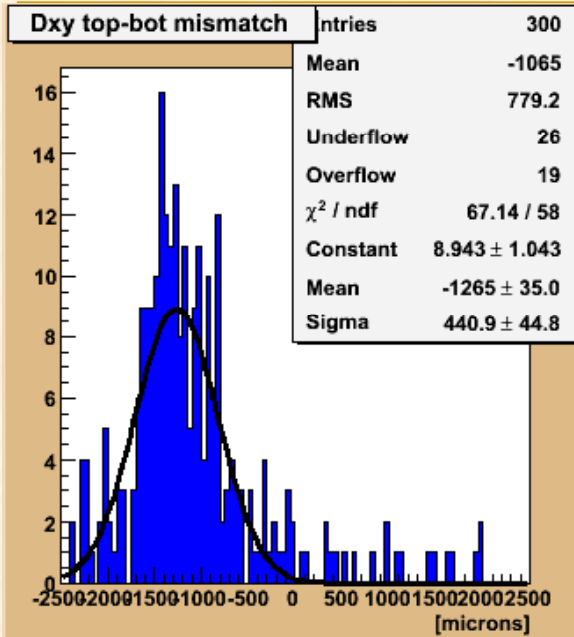

Max zoom in XY projection

alieve\_init → more flexibility in selecting geometry/alignment but less info from reco  
(no cosmic vertex found AliRoot-v4-16-Rev-01 → needs Andrea's patch)

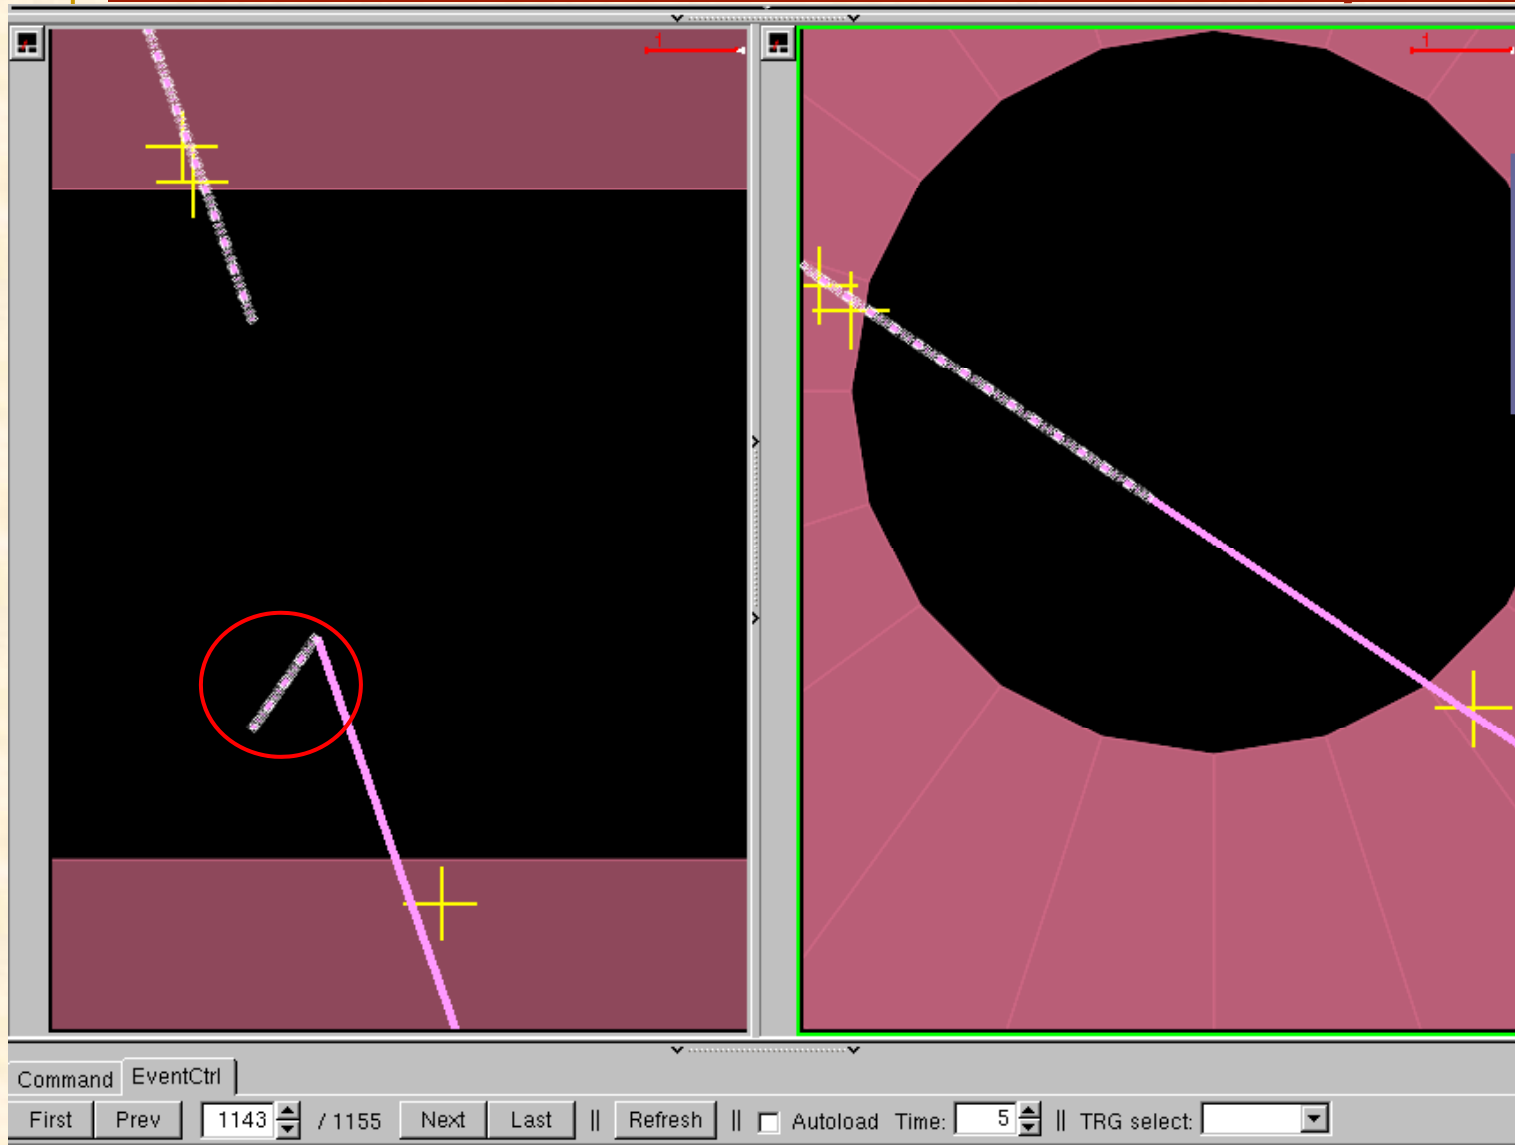

# Run 61418 event 1143 – visscan/zoom

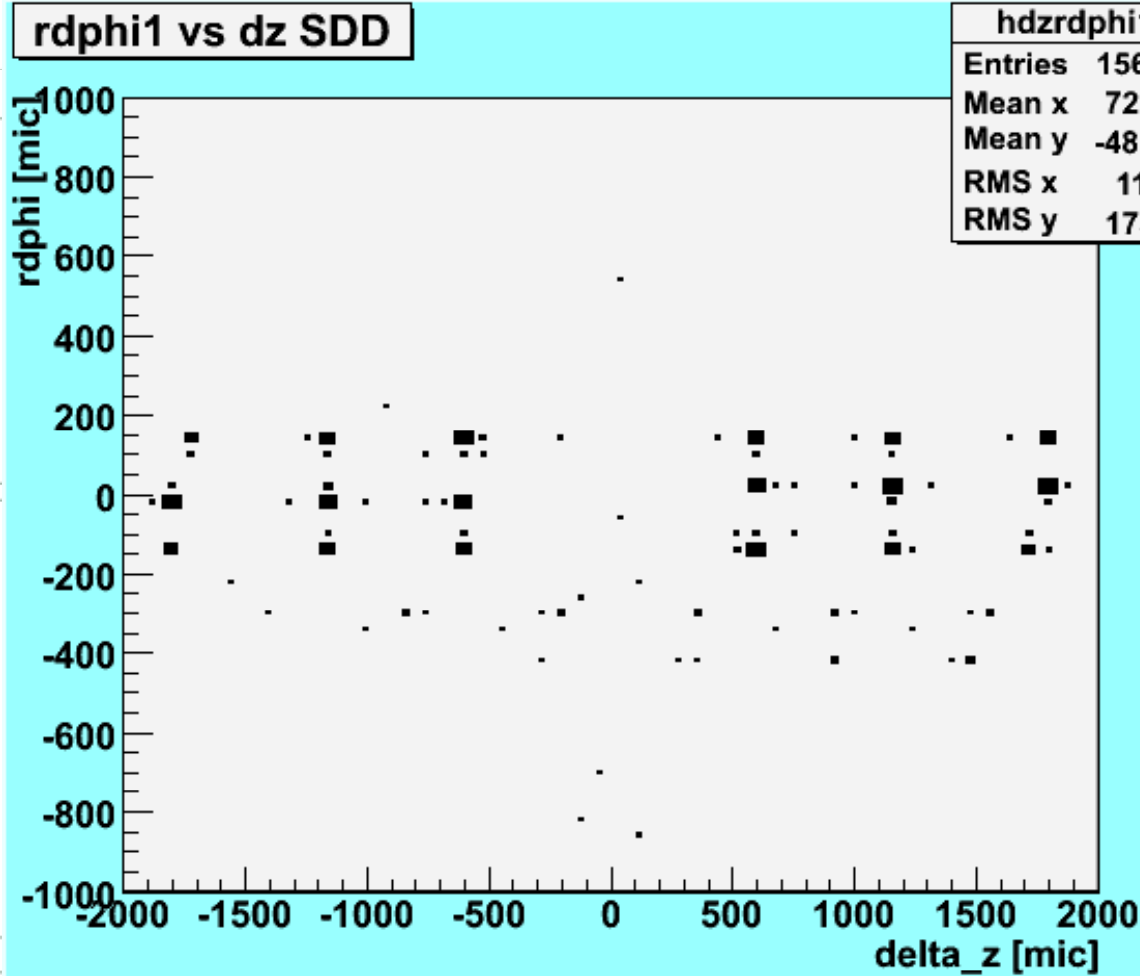

Forced OCDB geometry, gap in YZ, extra segment ?

# Case study – hunting correlated noise in SDD2

Rphi overlap  
ladders 4-5,  
modules 0

Correlated noise in the  
overlap regions – masking  
true overlap clusters  
used for (residual)  
misalignment estimate

Rphi overlap

# Still another practical problem

**How to find an intersection point between a track and a (transparent) sensor plane ?**

**→ Trying to find a rotation making a track practically point-like (in the range of interest), so  $\perp$  to the projection plane.**

**Complication - tracks are not straight in case of B ON**

# Event # 24\_3Dbis – missing hit

Only sector 3 shown here.  
Is particle passing through the dead Z-zone ?

Tracks from kinematics

# Looking along a track $\rightarrow$ localizing intersection point with a sensor plane

SPD1 is between the first 2 red points (SPD0 and SDD3)  $\rightarrow$  Intersection in the R-phi overlap zone !?

# Few final comments

- **Alignment – part of the QA, needs detailed geometry in the display**
- **Need to switch easily between different geometries and alignments**
- **Aligners typically need highly zoomed events and possibility to do simple measurements (scale, coordinates needed)**
- **Visscan vs simple alieve – plus and minus**
  - **Track refit only with visscan (?)**
  - **Free choice of geometry-alignment only with alieve\_init**
- **AliEve already a powerful tool, can do better...**

# ALICE coordinates

Fig1. Definition of the ALICE coordinate system axis, angles and detector sides.
