

AGLT2 Site Report

Shawn McKee/University of Michigan

Bob Ball, Chip Brock, Philippe Laurens, Ben Meekhof, Ryan Sylvester, Richard Drake OSG AHM 2016 / Clemson

Outline

- Site Summary
- Personnel Changes
- Moving locations at UM?
- Site Details

Site Summary

The ATLAS Great Lake Tier-2 (AGLT2) is a distributed LHC Tier-2 for ATLAS spanning between UM/Ann Arbor and MSU/East Lansing. Roughly 50% of storage and compute at each site

- 7116 single core job slots (Adding 1104 slots (23xR630s) in
 - one month; E5-2680v3, 192 GB ram, 4x500G NL-SAS each)
- MCORE slots 550 (dynamic) + 10 (static)
- 720 Tier-3 job slots usable by Tier-2
- Average 9.65 HS06/slot
- 3.7 Petabytes of storage
- Total of 68.6 kHS06
- Most Tier-2 services virtualized in VMware

2x40 Gb inter-site connectivity, UM has 100G to WAN, MSU has 10G to WAN, lots of 10Gb internal ports and 16 x 40Gb ports
 High capacity storage systems have 2 x 10Gb bonded links
 40Gb link between Tier-2 and Tier-3 physical locations

Personnel Changes

After many years with AGLT2 Ben Meekhof is moving on. Fortunately for us it is only across campus.

- Ben is the new OSiRIS Project Engineer (See talks today/tomorrow).
- Many, many thanks to Ben for all his hard work and innovations for AGLT2. <u>He will be missed.</u>

We interviewed 9 candidates as a replacement (out of about 18 applications) and selected Ryan Sylvester as the best candidate.
 Ryan will be starting in approximately 1 week and we hope he will be able to attend our next Facilities get together in person.

Possible Relocation at UM

- I was notified in February that the University would be doing construction and renovation of the building which houses AGLT2 at the University of Michigan in 10 months.
 - Someone at the University determined that the space currently housing LS&A IT and AGLT2 would be required to host new HVAC equipment.
- However they didn't check all the paperwork: We have a signed agreement from the University as part of the Tier-2 grant process to occupy that specific room for 5 more years.
 We are discussing options but are in a strong position if there are disagreements about how to proceed.
 - No single location meets our needs: equivalent power, space and cooling AND walk-able from physics (Undergrad access)
 One option: split to two locations...under discussion
 No costs to project. May involve some downtime(s)...

AGLT2 Monitoring

AGLT2 has a number of monitoring components in use As shown in before we have:

- Customized "summary" page->
- OMD (Open Monitoring Distribution) at both UM/MSU
- Ganglia
- Central syslog'ing via ELK:
 Elasticsearch, Logstash, Kibana
- SRMwatch to track dCache SRM status
- GLPI to track tickets (with FusionInventory)

AGLT2 Provisioning/Config Mgmt

- AGLT2 uses a Cobbler server configuration managed by CFEngine and duplicated at both sites for building service nodes (excepting site-specific network/host info)
 - Created flexible default kickstart template with Cobbler's template language (Cheetah) to install a variety of "profiles" as selected when adding system to Cobbler (server, cluster-compute, desktop, etc).
 - Simple PXE based installation from network
 - Cobbler manages mirroring of OS and extra repositories
- Kickstart setup is kept minimal and most configuration done by CFEngine on first boot
- Dell machines get BIOS and Firmware updates in post-install using utils/packages from Dell yum repositories

HTCondor CE at AGLT2

- Bob Ball worked for ~1 month at AGLT2 setup
 - Steep learning curve for newbies
 - Lots of non-apparent niceties in preparing job-router configuration
 - RSL no longer available for routing decisions
- Cannot change content of job route except during condor-ce restart
- However, CAN modify variables and place them in ClassAd variables set in the router
 - Used at AGLT2 to control MCORE and LargeMEMory slot access

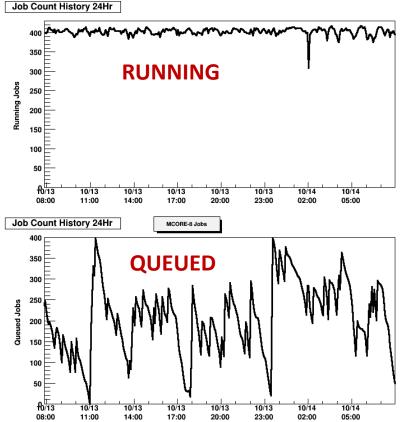

In place on all gatekeepers

• See full details of our experience and setup at <u>https://www.aglt2.org/wiki/bin/view/AGLT2/CondorCE</u>

MCORE at AGLT2

- AGLT2 has supported MCORE jobs for many months now
- Condor configured for two MCORE job types
 - Static slots (10 total, 8 cores each)
 - Dynamic slots (420 of 8 cores each)
- Requirements statements added by the "condor_submit" script
 - Depends on count of queued MP8 jobs
- Result is instant access for a small number with gradual release of cores for more with time.

Full details at https://www.aglt2.org/wiki/bin/view/AGLT2/MCoreSetup

Large MEMory at AGLT2

- AGLT2 has supported LMEM jobs for the past few months now
- Condor configured for 6GB image allocation
- Machines dynamically configured to support LMEM slots
- Number per machine limited based upon hardware configuration
 Utilizes an allocatable resource on each machine
- Requirements statements added by the HTCondor-CE Job Router
- AGIS (ATLAS info system) must be defined with a floor in the memory
 - Queue accepts jobs in the range of 4GB-6GB
 - Minimum is required or all jobs can (and will) use precious LMEM slots

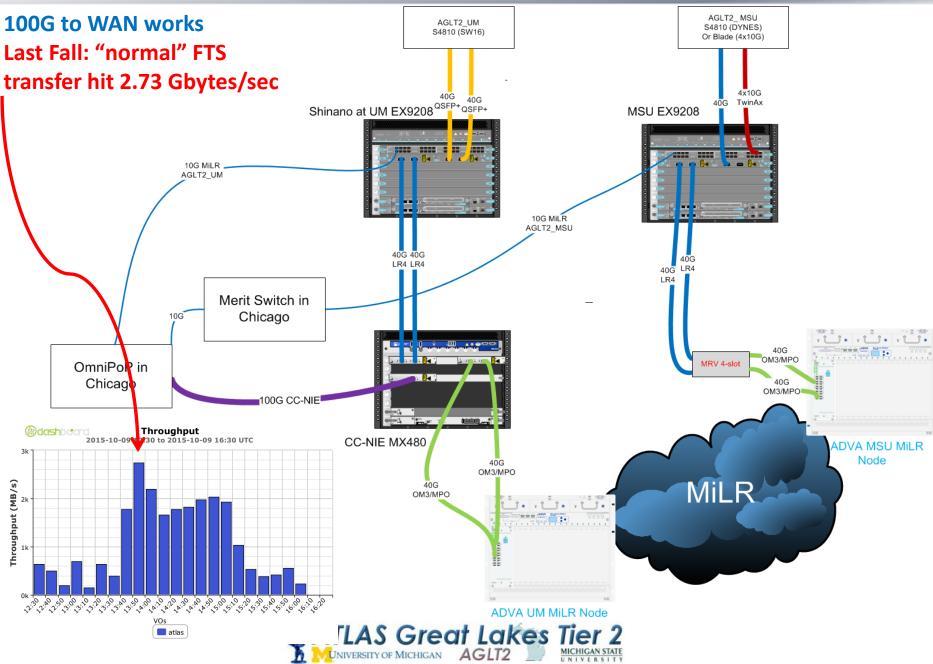

ATLAS Calibration

- There are 3 ATLAS calibration sites: AGLT2 (Ann Arbor), CNAF (Rome), and LMU (Munich)
- This year all 3 sites switched over to replicating calibration job outputs using tool written at AGLT2 (Ben Meekhof)
 - Calib jobs write constants to Oracle database at each site which then must be put into central CERN db
 - Previously used Oracle Streams...placed constraints on database structure, large database changes, and had to be monitored closely
- Moving away from streams replication allowed us to redo the database schema with a more logical layout
 - Data was split into individual schemas for each year, now one unified schema with partitioned tables.
 - CERN and UM using new schema, CNAF considering, unsure at LMU
 - Database tool can handle either schema in source/destination

AGLT2 100G Network Details

Madalert

New project: high-level analysis on maddash meshes

- Find problem patterns
- Produces high level report
- Useful when the grid is too big and "busy" to see problems
- Started as a series
 - of python scripts.
- Being re-architected
 - Java web service for the analysis for future integration in MadDash
 - Client Javascript web UI
 - Python client for integration in OMD/check_mk and other tools

Deployed: <u>http://maddash.aglt2.org/madalert.html</u> Source: <u>https://github.com/gcarcassi/madalert</u>

Pattern	Rule name	Description					
	All down	All tests for all sites are unknown. This typically happens when the data store cannot be accessed.					
	Site down	All tests for a particular site are unknown. This can happen if the site is down (check ping), the test service is down or the firewall is misconfigured.					
	Site can't test	All tests initiated by a particular site are unknown. This can happen if the archive service is down, the scheduling service is doing, the configuration is faulty or the outgoing firewall rules are misconfigured.					

Rules for infrastructure problems

Future Plans

- Participating in SC16 (simple infrastructure for 100G+)
- Still exploring OpenStack as an option for our site. Testing Ceph for a back-end.
- New network components support Software Defined Networking (OpenFlow). We are experimenting with SDN in our Tier-2 and as part of LHCONE point-to-point testbed.
- Working on IPv6 dual-stack for all nodes in our Tier-2
 - Have IPv6 address block
 - Waiting for UM/MSU network engineers to complete routing (ESnet peering underway)

Summary

- Tier-2 services and tools are evolving. Site continues to expand and operations are smooth.
- New large memory queue and multicore support enabled for AGLT2 using HT-Condor CE
- Muon calibration work completed to support Run-2 mode of operation. Working well
- Network 2x40G inter-site, 100G WAN, just works.
- MadAlert is a new project to analyze perfSONAR results and identify issues.
- FUTURE: OpenStack, IPv6, SDN

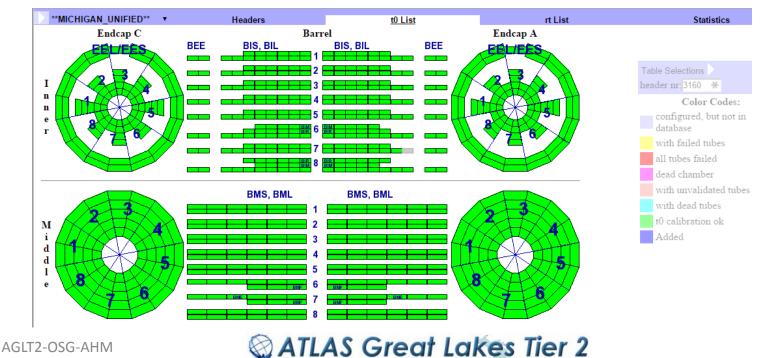

Questions ?

Extra Slides

ATLAS Calibration

- With addition of new chambers to ATLAS the Database
 Observer used for visual overview of calibration had to be updated.
 - We took on maintenance of this project (originally written at Munich)
 - Did fixes to related package MuonFixedIdUnpack (also used by database tool)
 - SVN Web: <u>https://svnweb.cern.ch/trac/msd/browser/calib_db_checks/trunk</u>
 - All 3 sites + CERN viewable on our observer: <u>https://linat05.grid.umich.edu/calibdb</u>

Virtualization at AGLT2

Most Tier-2 services run on VMware (vSphere 5.5u3)

UM uses iSCSI storage backends

- Dell MD3820i + MD1220, MD3600i + MD1200 and SUN NAS 7410
- vSphere manages virtual disk allocation between units and RAID volumes based on various volume performance capabilities and VM demand
- MSU runs on DAS Dell MD3200

Site resiliency details

- Multisite SSO operational between sites (SSO at either site manages both sites)
- MSU is operating site-specific Tier-2 VMs (dcache doors, xrootd, cobbler) on vSphere
- VMware Replication Appliance is used to perform daily replications of critical UM VMs to MSU's site. This is working well.
