Positron Imaging

Positrons produced from β^+ decay of proton rich nuclei

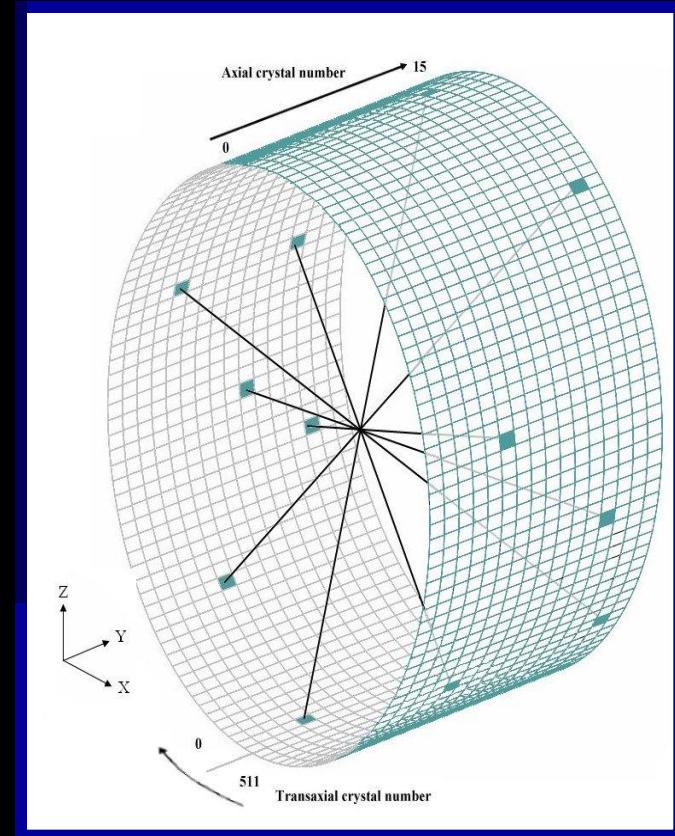

Positron loses energy & annihilates

Results in 2 back-to-back 511 keV photons

Coincident detection of both photons defines trajectory

Medical imaging involves radio-labelling of glucose molecules

Industrial imaging involves labelling fluids or particles

Positron Emission Tomography

Comparison of MRI & PET images

Acquisition times:

Minutes – hours

$\sim 10^9$ events

Positron Emission Particle Tracking

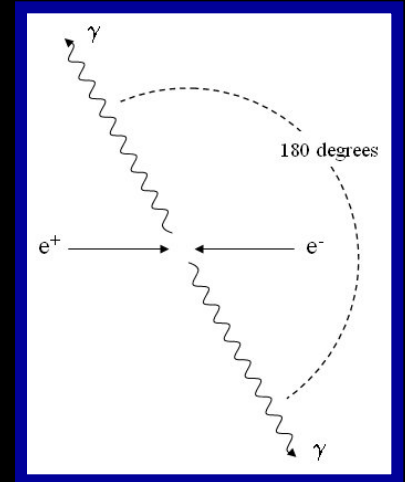

Single particle loaded with radioisotope

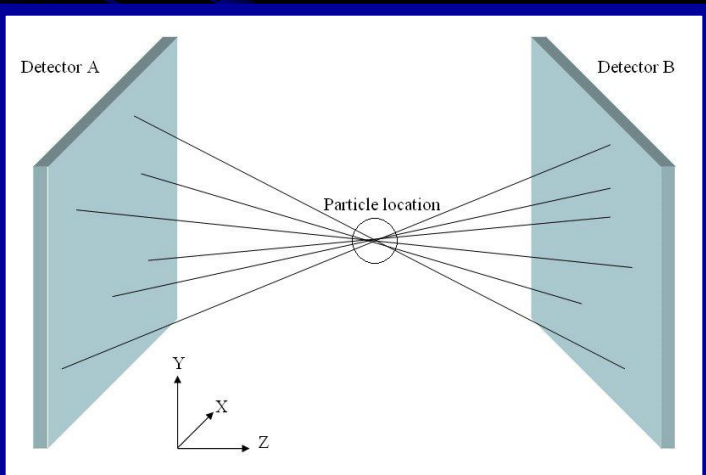

Line of Response (LOR) defined along photon trajectory

Triangulation of successive LORs gives particle location

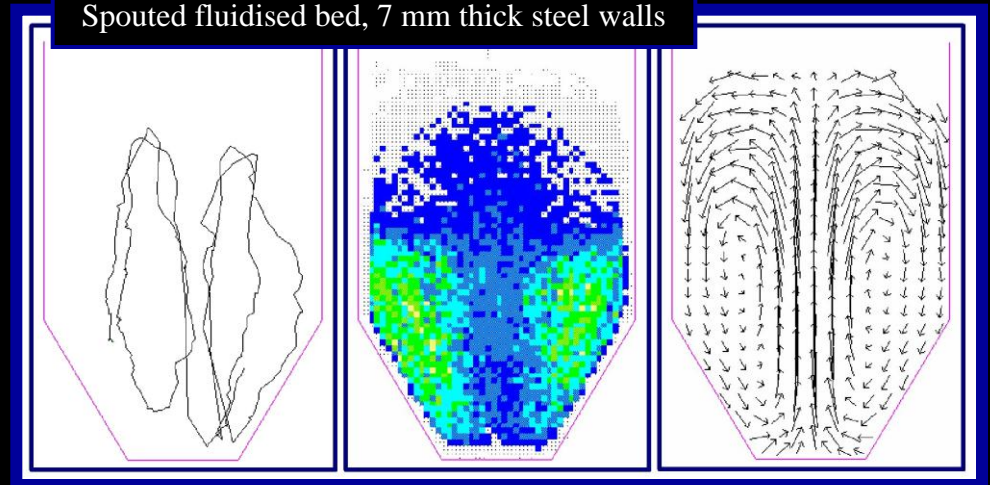

50 – 1000 events per location

~50% of 511 keV photons are transmitted through 11 mm steel

Spouted fluidised bed, 7 mm thick steel walls

Particulate Science & Technology

Three primary phases of matter: **Solids, Liquids & Gases**

Particles / powders make up to 70% of matter processed by humanity:

Solid particles, bubbles, liquid drops

Particles / powders exhibit properties of all **three** phases:

Withstand deformation (**solids**)

Flow (**liquids**)

Can be compressed (**gases**)

Particulate science aims to understand relationships between micro- (particle scale) and macro- (bulk behaviour) properties

Understanding of particle – particle and particle – fluid interactions

Detector Systems

Detectors derived from redundant
clinical imaging systems
(ECAT-931 Siemens medical systems)

2 rings of 64 detector blocks:
8 x 4 BGO crystal elements
6.25 x 12.5 mm²
4096 detection elements

Modified for PEPT:

Time information
List – mode data storage

Modular Positron Camera

Modular detector units (scintillators, PMTs, support electronics etc.)

Central coincidence processing units

Data acquisition and processing system

Customisable geometry:

Accommodate large apparatus

Transportable

Adjustable field of view:

Design camera geometry for application

High sensitivity regions-of-interest

Cover many sections of device

16 modules housed in sturdy boxes and PAT tested

System Performance – Single gammas

Energy resolution @ 511keV (FWHM photopeak) measured to be 15% (75keV)

Energy discriminators set to 350 - 850 keV

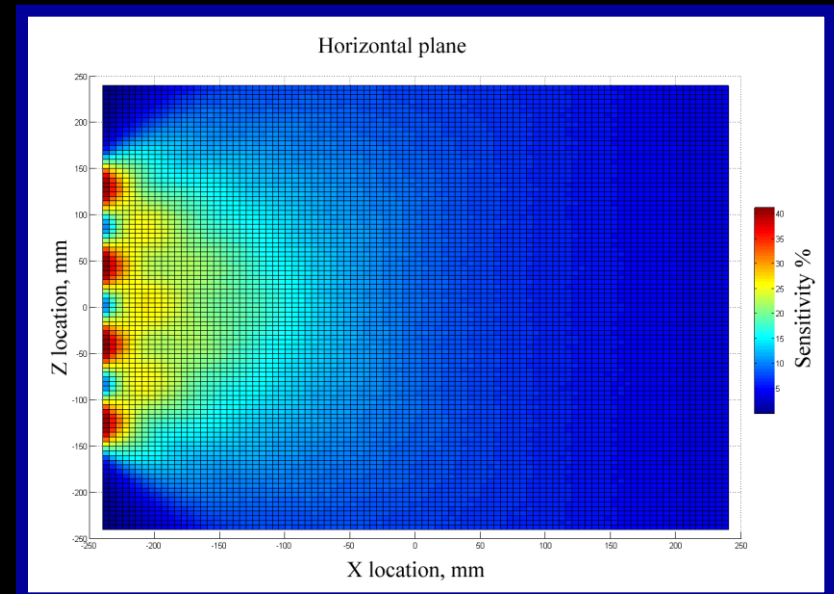

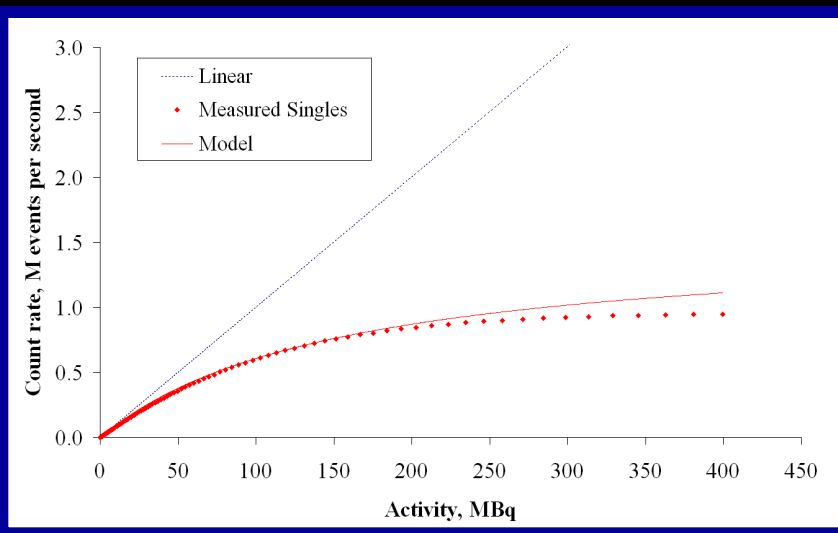

Accepts scatters up to 55 degrees, but allows high event rate

Intrinsic peak efficiency measured to be 45%

Response linear with activity up to 500k events per second

Event rate saturation at 1M events per second

Dead time $0.65\mu\text{s}$ per module, $1.2\mu\text{s}$ per block

System Performance – Coincidences

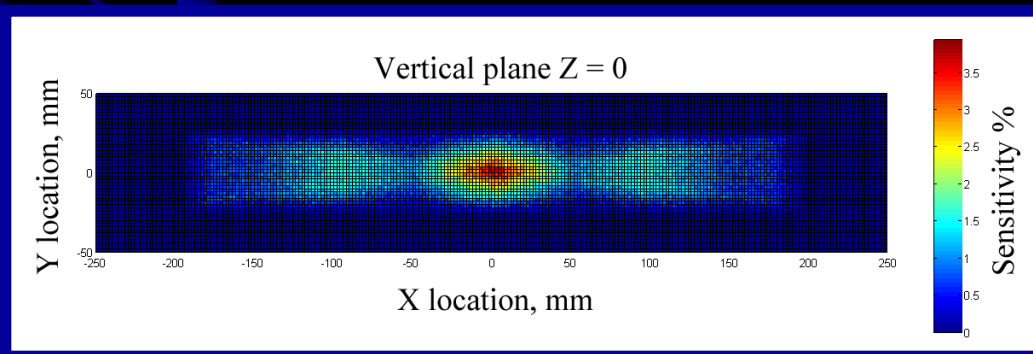

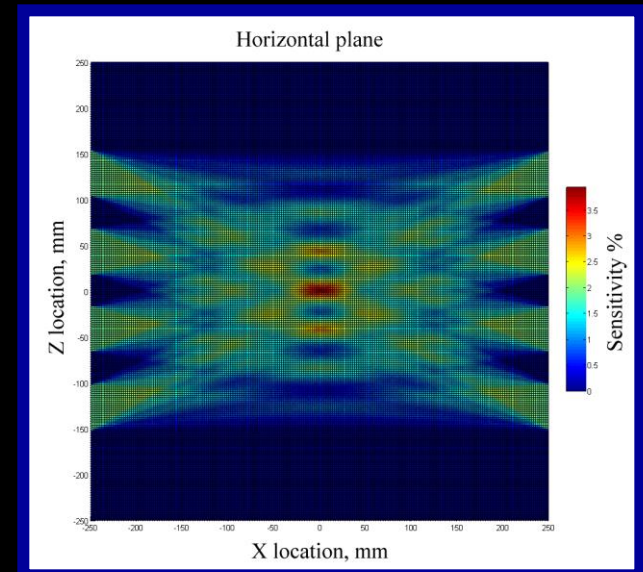

2 opposing modules separated by 250 mm

Bare tracer peak coincidence sensitivity 5% (centre)

Average sensitivity across FoV 1%

Monte Carlo sensitivity maps used to optimise camera geometry

PEPT algorithm relatively insensitive to non-uniform field of view

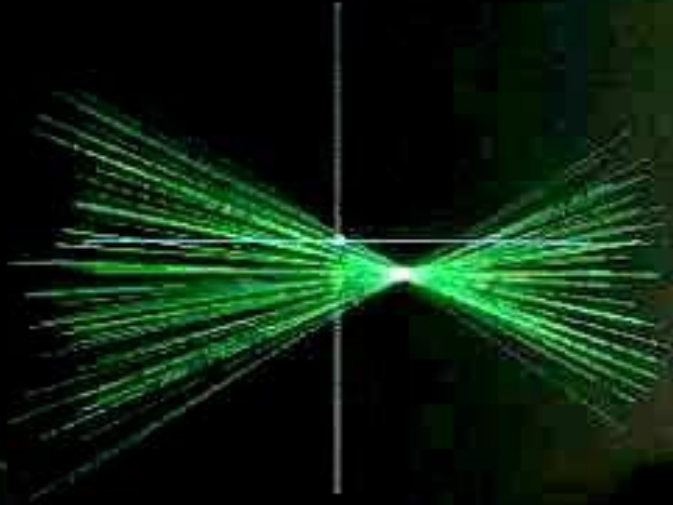

Practical Demonstration

DispLOR OpenGL

Rotation:
W.A.A.A.A.A.
Translation:
A.A.A.A.A.A.
Zoom:
A.A.A.A.A.A.

In practice

Data rates up to 4MHz (optimum activity ~ 100MBq)

Locations on kHz basis

Precision around 1mm in 3D

Tracer moving at 1m/s moves 2mm in this time

Transmission of 511keV photons allows real systems to be studied
– i.e. dense and opaque systems, steel HVL 11mm

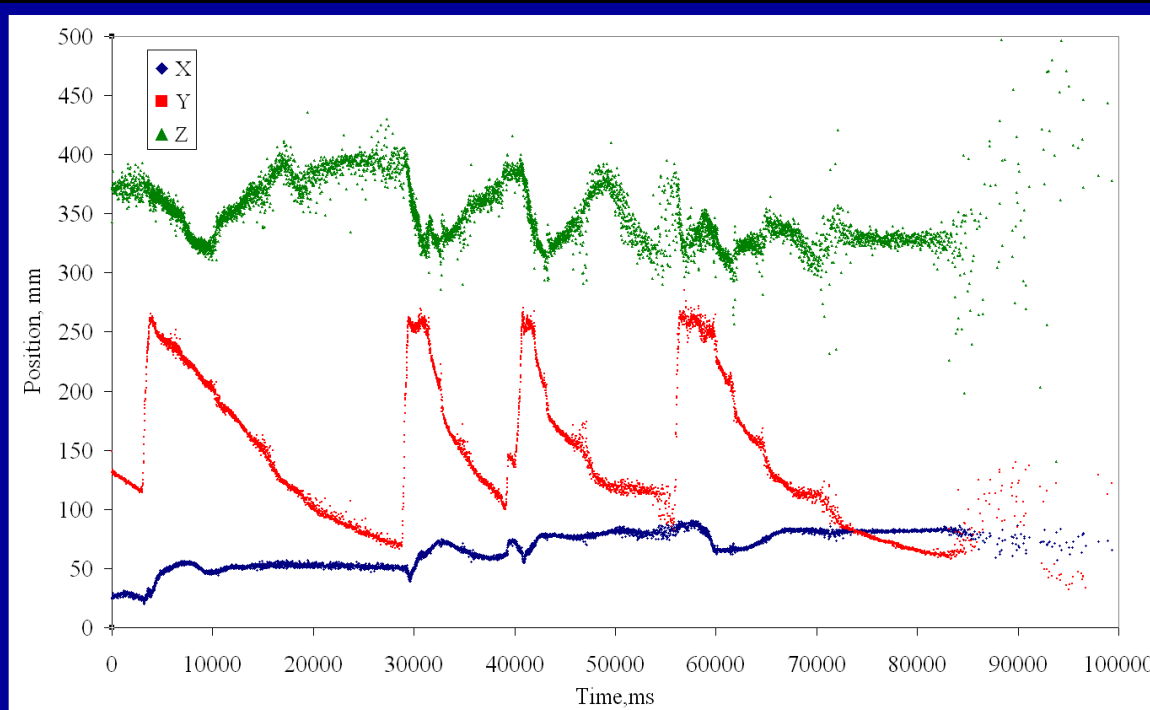

- Tracers with a size range 50 μm – mm's

Range of materials: Glass, sand, resins, catalysts, FCC and Gamma alumina, zirconia, drugs, plant seeds, potatoes, salt, coffee ...

Fluidised bed: Chemical Engineering

High pressure fluidised bed
Used for polymer processing

7 bar pressure, 100C

Metal casting: Metallurgy & Materials

Low temperature metals (100C)
Aluminium (660C)
Steel (2000C)

Tracer particle activity 5 – 40 MBq
Raw data rates 25-300 kHz
Particle location rate 1 - 4 kHz.
Locations accurate to:
0.5mm (stationary)
2.5mm (moving 1ms^{-1})

Conclusions

A modular positron camera has been developed allowing the study of a wide range of industrial systems

The flexible geometry offered by the modular camera allows:

The field of view of the camera to be custom designed

Transportation of the camera to study applications *in situ*.

Modular camera has been characterised

Modular camera systems used for a number of experiments:

Various locations both on and off Birmingham campus

Recorded data at rates up to 4 MHz

Frequent and accurate locations

Thanks for your attention
