Capacitively Coupled Contactless Conductivity Detection (C4D) technique for flow cytometry application

Thursday, 25 May 2017 10:20 (15 minutes)

Capacitively Coupled Contactless Conductivity Detection (C4D) technique for particle detection or flow cytometry has been increasingly interested. This detection technique in microfluidic system utilizes two electrodes, excitation and pick-up electrodes, which are not directly in contact with solution in microchannel. In this study, Particulate of different sizes suspended in DI water were performance and were used in testing the C4D flow cytometry detection. Computational simulation were also carried out to investigate how the detected signal changes with the present of the suspended particulate.

Primary author: MASAEN, Korkuson (Chiangmai University)

Co-authors: Mr JITVISATE, Monchai (MESA+ Institute of Nanotechnology, University of Twente, The Netherlands); Dr PUSSADEE, Nirut (Plasma and Beam Physics Research Facility, Department of Physics and Materials Science, Faculty of Science, Chiang Mai University, Chiang Mai, 50200, Thailand)

Presenter: MASAEN, Korkuson (Chiangmai University)

Session Classification: A8: Instrument I

Track Classification: Instrumentation, Metrology and Standards
