

Search for P and T Violation in Excited Nuclear Systems

Mike Snow

Indiana University/CEEM

IU Center for Spacetime Symmetries

What is T violation and why is it interesting (a reminder)

Sensitivity to T violation of precision experiments in strongly-interacting systems

Polarized neutron optics test of T invariance: the idea

QUESTION: can T-odd “noise” from local symmetry violation in exotic QCD phases “leak into” low energy observables in nuclei?

P, CP, T, and CPT

- Parity violation (1956)
 - only in weak interaction
- CP violation (1964)
 - parametrized but not understood
 - only seen so far in K^0 & B^0 systems
 - Doesn't seem to be responsible for baryon asymmetry of universe
- T violation (1999)
 - CPT is good symmetry so far: $T \leftrightarrow CP$

Matter/Antimatter Asymmetry in the Universe in Big Bang, starting from zero

Sakharov Criteria to generate matter/antimatter asymmetry from the laws of physics

- Baryon Number Violation (not yet seen)
- C and CP Violation (seen but too small by $\sim 10^{10}$)
- Departure from Thermal Equilibrium (no problem?)

A.D. Sakharov, JETP Lett. 5, 24-27, 1967

Searches for T violation in strongly-interacting systems at low energy:

Electric Dipole Moment Searches ($E \sim 0$)

T-odd Polarized Neutron Optics ($E \sim 6$ MeV)

Electric Dipole Moments: P-odd/ T-odd Observable

$$\vec{d}_n = \int \vec{x} \rho(x) d^3 x = d_n \hat{s}$$

Non-zero d_n violates both P and T

Under a parity operation:

$$\hat{s} \rightarrow \hat{s}, \quad \vec{E} \rightarrow -\vec{E}$$

$$\vec{d}_n \cdot \vec{E} \rightarrow -\vec{d}_n \cdot \vec{E}$$

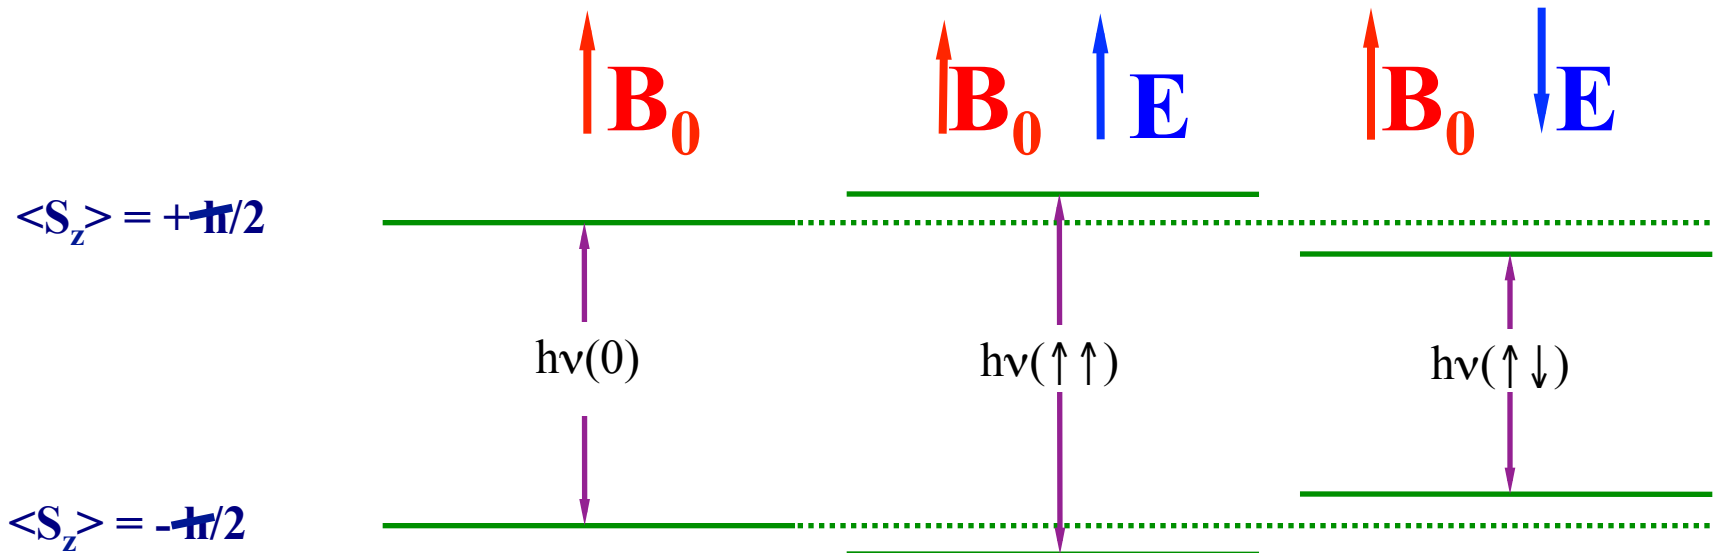

Under a time-reversal operation:

$$\hat{s} \rightarrow -\hat{s}, \quad \vec{E} \rightarrow \vec{E}$$

$$\vec{d}_n \cdot \vec{E} \rightarrow -\vec{d}_n \cdot \vec{E}$$

EDMs are “null tests” of time reversal invariance
(no “final state effects” can fake an EDM)

EDM Measurement Principle/Sensitivity

$$\nu(\uparrow\uparrow) - \nu(\uparrow\downarrow) = -4 E d / h$$

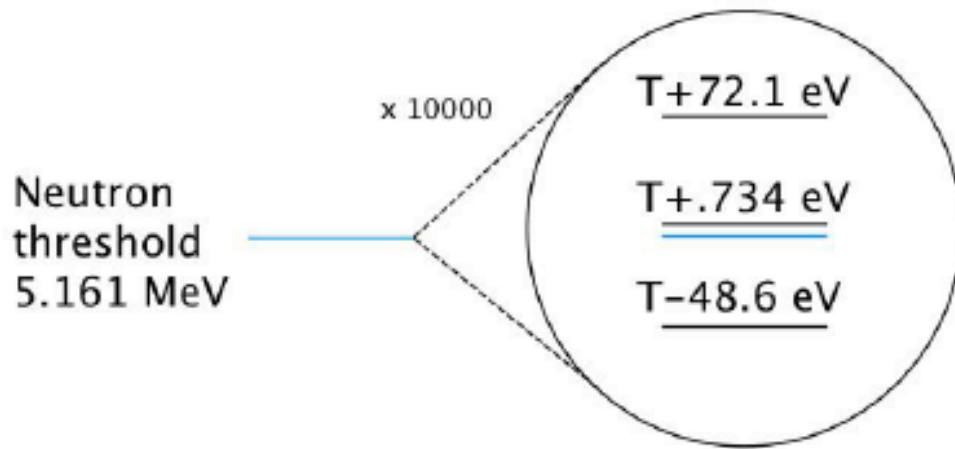

assuming \mathbf{B} unchanged when \mathbf{E} is reversed.

EDM limits \rightarrow ratio (T-odd amplitude in nucleon/strong amplitude) $\sim 10^{-11}$

T violation from CKM phases smaller by ~ 5 orders of magnitude here

EDMs are ground state properties of the system: excitation energy ~ 0

$^{139}\text{La}+n$ System

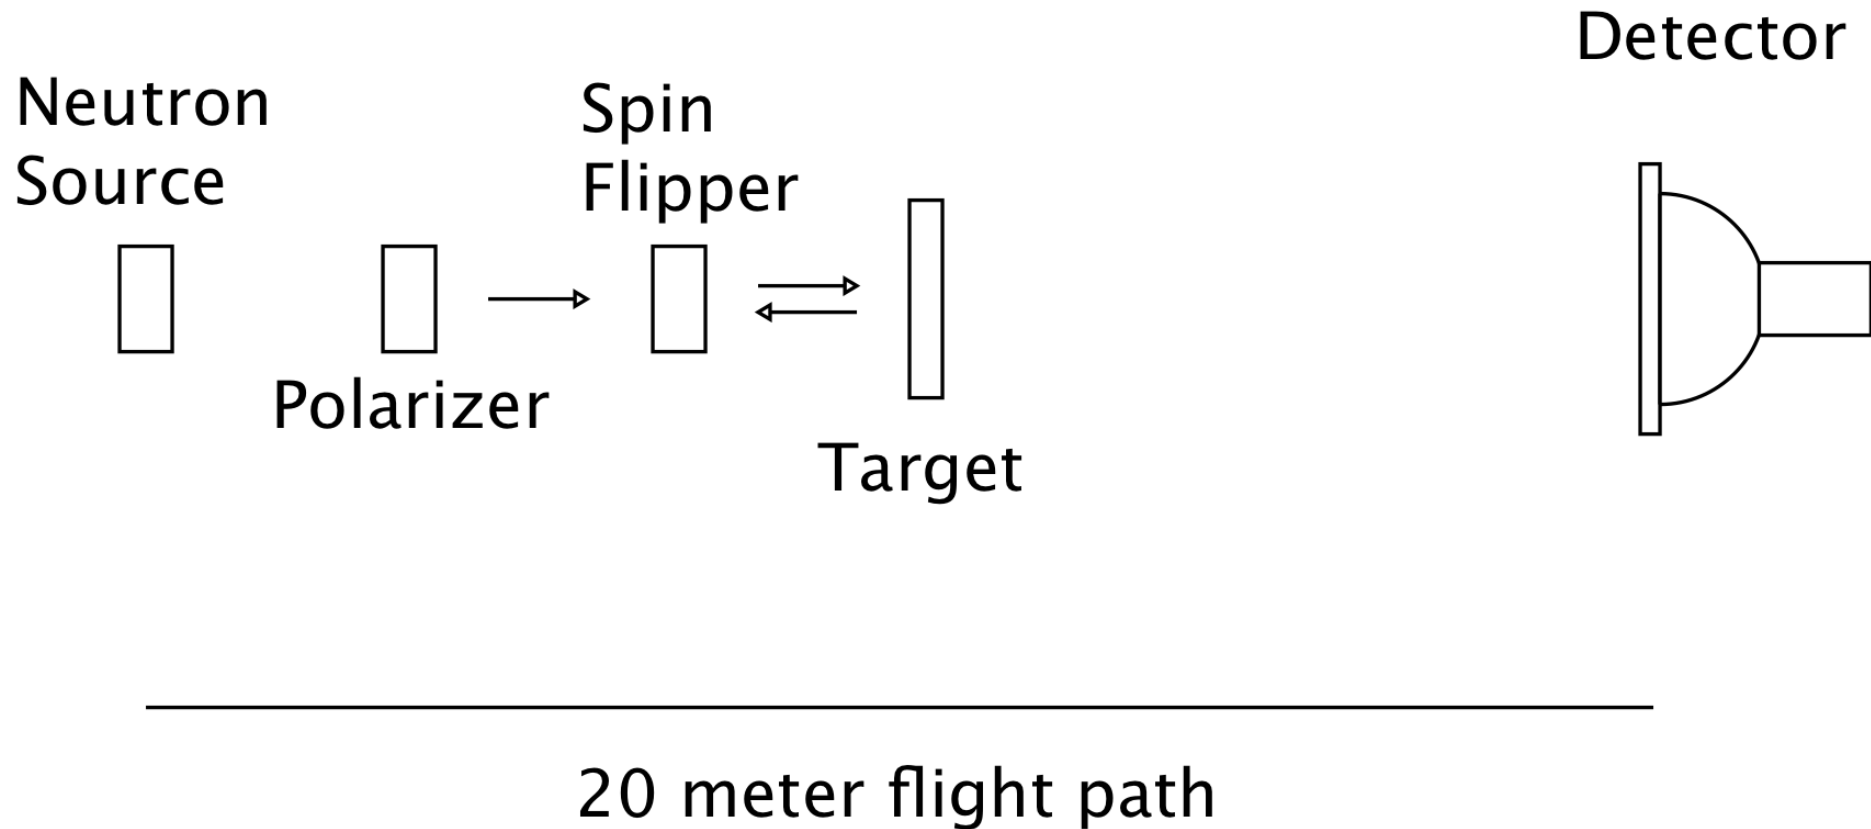

Compound-Nuclear States in $^{139}\text{La}+n$ system

Low energy neutrons can access a dense forest of highly excited states in the compound nucleus.

Large amplification of discrete symmetry violation (P and T) is possible. Very large amplifications of P violation were observed long ago

Apparatus to Measure $\sigma \cdot k$ Parity Violating Asymmetry

TRIPLE collaboration measured ~ 60 parity-odd asymmetries in p-wave resonances in heavy nuclei [G. M. Mitchell, J. D. Bowman, S. I. Penttila, and E. I. Sharapov, Phys. Rep. 354, 157 \(2001\)](#).

Quantitative analysis of distribution of parity-odd asymmetries conducted using nuclear statistical spectroscopy [S. Tomsovic, M. B. Johnson, A. Hayes, and J. D. Bowman, Phys. Rev. C 62, 054607 \(2000\)](#).

Large Parity Violation in the Compound Nucleus

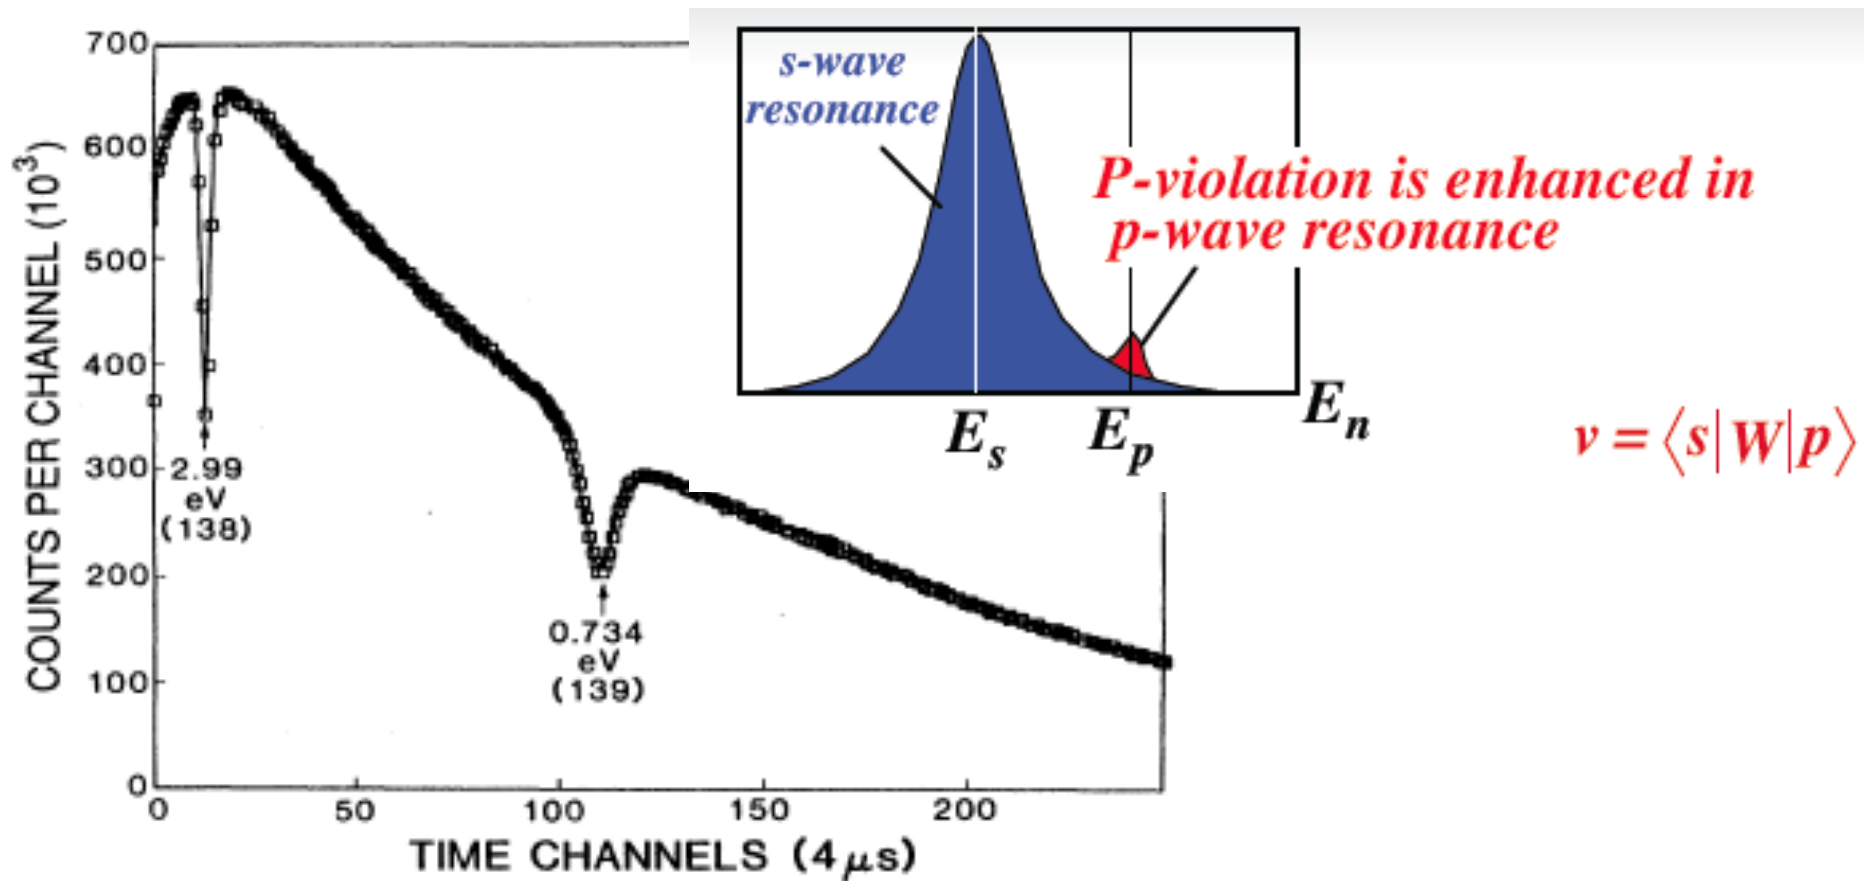

~60 P-odd asymmetries measured

Parity violations observed by TRIPLE

Target	Reference	All	$p+$	$p-$
^{81}Br	[67]	1	1	0
^{93}Nb	[125]	0	0	0
^{103}Rh	[132]	4	3	1
^{107}Ag	[97]	8	5	3
^{109}Ag	[97]	4	2	2
^{104}Pd	[134]	1	0	1
^{105}Pd	[134]	3	3	0
^{106}Pd	[43,134]	2	0	2
^{108}Pd	[43,134]	0	0	0
^{113}Cd	[121]	2	2	0
^{115}In	[136]	9	5	4
^{117}Sn	[133]	4	2	2
^{121}Sb	[101]	5	3	2
^{123}Sb	[101]	1	0	1
^{127}I	[101]	7	5	2
^{131}Xe	[140]	1	0	1
^{133}Cs	[126]	1	1	0
^{139}La	[152]	1	1	0
^{232}Th below 250 eV	[135]	10	10	0
^{232}Th above 250 eV	[127]	6	2	4
^{238}U	[41]	5	3	2
Total		75	48	27
Total excluding Th		59	36	23

Parity Violation in $n + {}^{139}\text{La}$ at 0.734 eV $\Delta\sigma/\sigma = 0.097 \pm 0.005$.
 Larger than dimensional analysis estimate by $\sim 10^6$

- How? (1) Admixture of (large) s-wave amplitude into (small) p-wave $\sim 1/kR \sim 1000$
 (2) Weak amplitude dispersion for 10^6 Fock space components $\sim \sqrt{10^6} = 1000$

Idea is to use the observed enhancement of PV to search for a TRIV asymmetry.

Forward Scattering Amplitude

$$f = \underbrace{A'}_{\text{Spin Independent}} + \underbrace{B' \sigma \cdot \hat{I}}_{\text{Spin Dependent}} + \underbrace{C' \sigma \cdot \hat{k}}_{\text{P-violation}} + \underbrace{D' \sigma \cdot (\hat{I} \times \hat{k})}_{\text{T-violation}}$$

Spin Independent
P-even T-even

Spin Dependent
P-even T-even

P-violation
P-odd T-even

T-violation
P-odd T-odd

$ s\rangle$	$ p\rangle$	$ p_{1/2}\rangle$	$ p_{3/2}\rangle$	
$J_s E_s \Gamma_s \Gamma_s^n$	$J_p E_p \Gamma_p \Gamma_p^n$	$\Gamma_{p,1/2}^n$	$\Gamma_{p,3/2}^n$	$\langle W \rangle$

The enhancement of P-odd/T-odd amplitude on p-wave resonance ($\sigma \cdot [K \times I]$) is (almost) the same as for P-odd amplitude ($\sigma \cdot K$).

Experimental observable: ratio of P-odd/T-odd to P-odd amplitudes $\lambda_{PT} = \frac{\delta\sigma_{PT}}{\delta\sigma_P}$

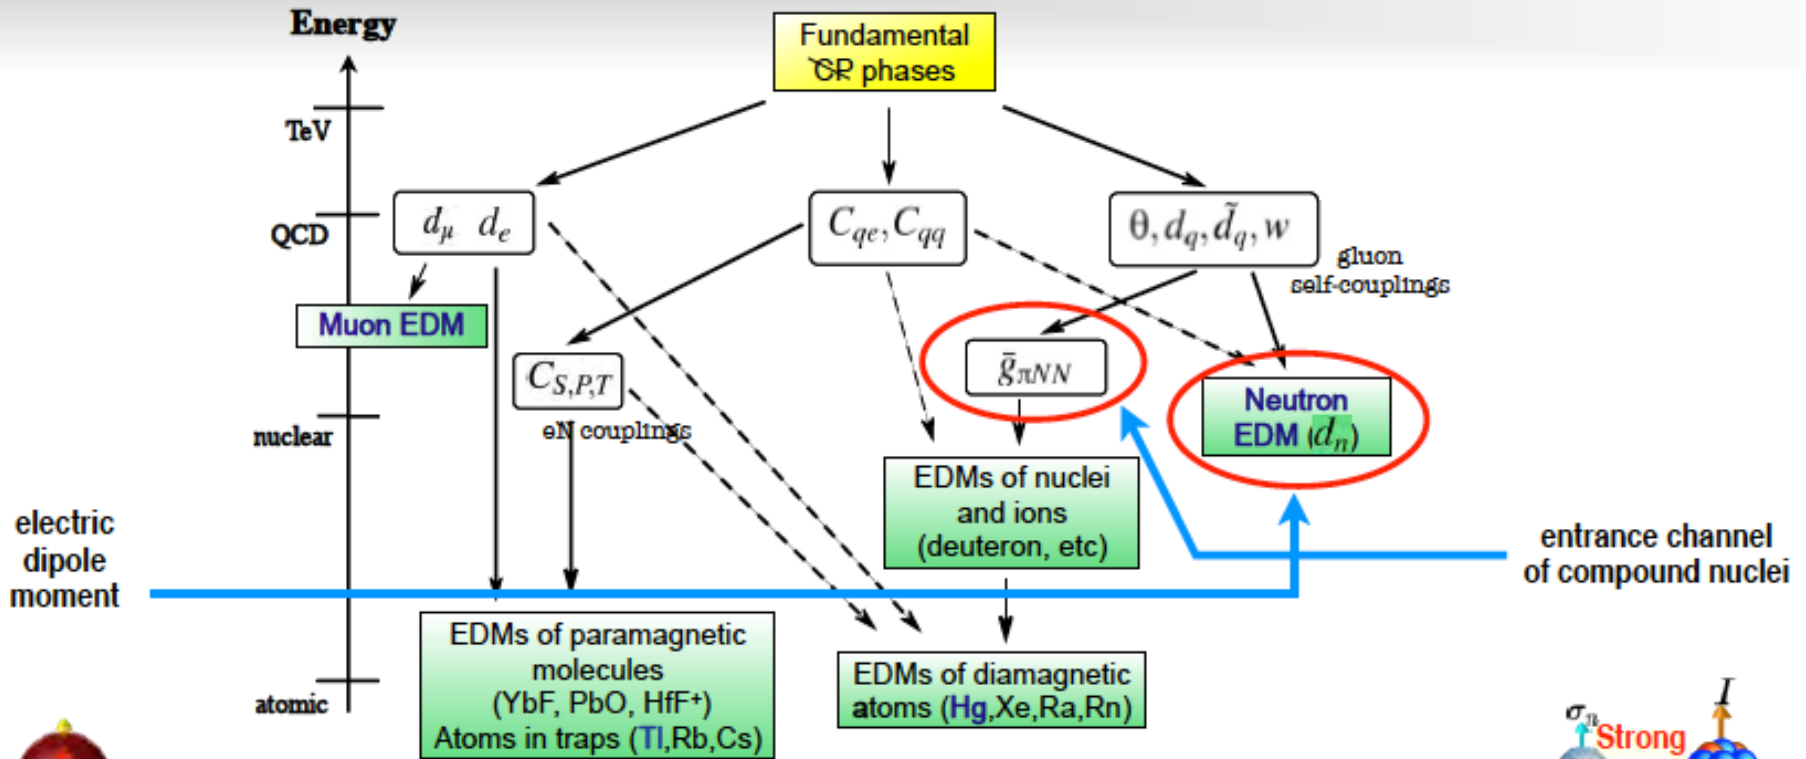

λ can be measured with a statistical uncertainty of $\sim 1 \cdot 10^{-5}$ in 10^7 sec at MW-class spallation neutron sources.

Ratio (T-odd amplitude in nucleon/strong amplitude) $\sim 10^{-12}$

Excitation energy (\sim few MeV) is not zero.

Forward scattering neutron optics limit is null test for T (no final state effects)

T violation Searches with EDMs and Compound Nuclei

Pospelov Ritz, Ann Phys 318 (05) 119

d_n

complicated theoretical landscape
important to perform experiments in many systems

$$\sigma_n \cdot (k_n \times I)$$

Conclusions/Question

Any discovery of a new source of T violation is of fundamental importance for physics, and possibly also for cosmology

EDMs and T violation in epithermal neutron resonances are both true “null tests” for T violation and are sensitive searches for T in strongly interacting systems

ratio (T-odd amplitude in nucleon/strong amplitude) $\sim 10^{-11}$ - 10^{-12}

Excitation energy (EDMs) ~ 0 Excitation energy (n resonances) \sim few MeV

local symmetry violation in exotic QCD phases can make T-odd “noise”
ratio (T-odd noise from local symmetry violation/strong amplitude) $\sim 10^{-2}$

local symmetry violation effects: do they completely go away in a different phase?

QUESTION: can T-odd “noise” from local symmetry violation in exotic QCD phases “leak into” low energy observables in nucleons/nuclei?

T violation in Neutron Optics

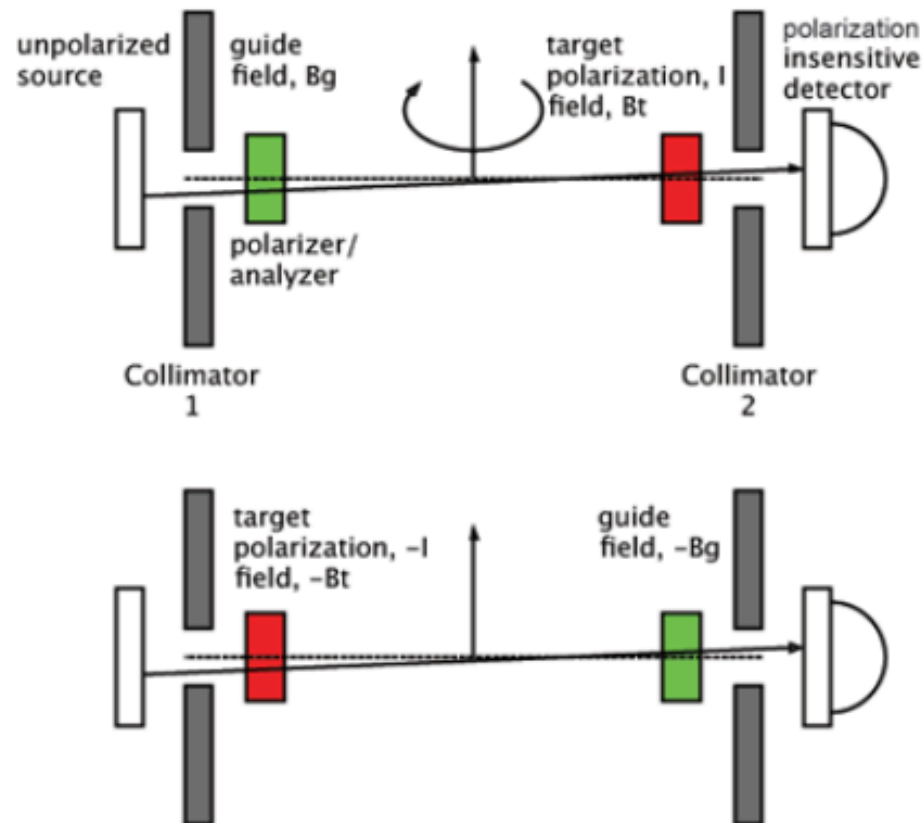

- T – odd term in FORWARD scattering amplitude (a null test, like EDMs) with polarized n beam and polarized nuclear target
- P-odd/T-odd (most interesting) $\vec{\sigma}_n \cdot (\vec{k}_n \times \vec{I})$
- Amplified on select P-wave epithermal neutron resonances by ~5-6 orders of magnitude
- Estimates of stat sensitivity at SNS/JSNS look very interesting:
Existing technology/sources $\rightarrow \Delta\sigma_{PT}/\Delta\sigma_P \sim 1E-5$
- The nuclei of interest, resonance energies, and P-odd asymmetry amplifications are measured

Nucleus	Resonance Energy	PV asymmetry
^{131}Xe	3.2 eV	0.043
^{139}La	0.748 eV	0.096
^{81}Br	0.88 eV	0.02

EDITORS' SUGGESTION Phys. Rev. C (2015)

Search for time reversal invariance violation in neutron transmission

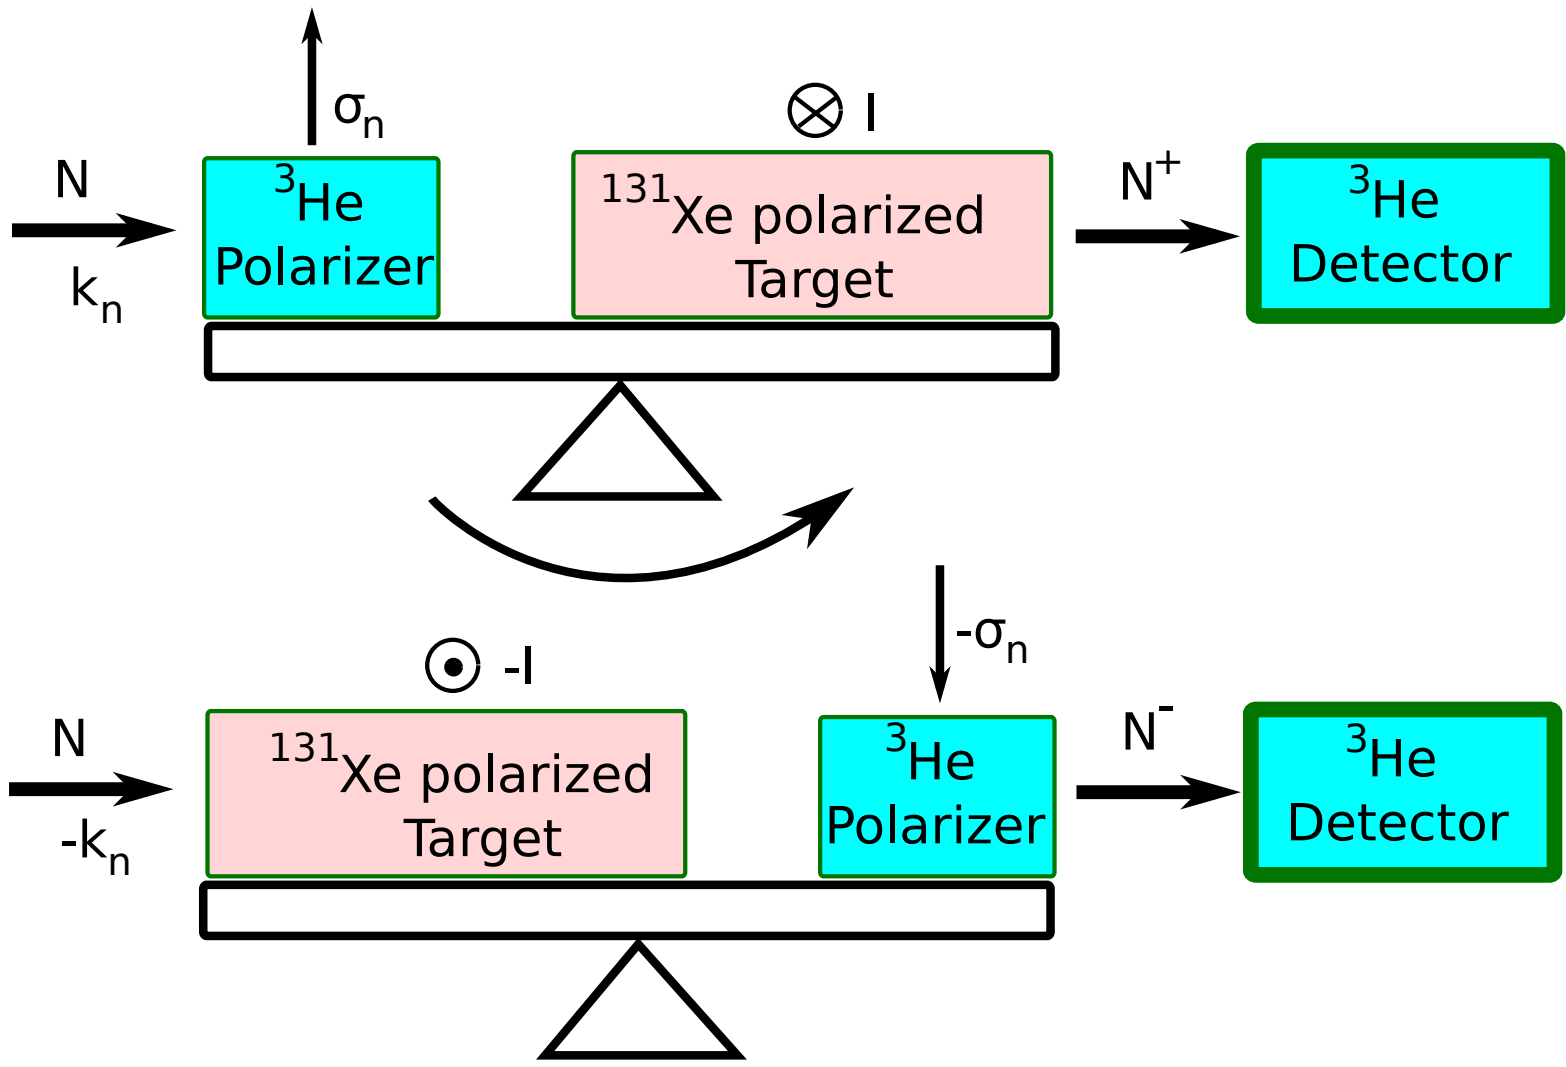

J. David Bowman and Vladimir Gudkov

The authors analyze a novel null test to search for time reversal invariance in a model neutron transmission experiment. The proposed experimental procedure involves nuclear reactions and is sensitive to the neutron-nucleus interactions. The approach could significantly increase the discovery potential compared to the limits of present experiments.

“Motion-Reversed” Experiment (sys error free in the n optics limit)

$$f = f_0 + f_1 \vec{\sigma}_n \cdot \vec{I} + f_2 \vec{\sigma}_n \cdot \vec{k}_n + f_3 \vec{\sigma}_n \cdot (\vec{k}_n \times \vec{I}) \quad f_3 \ll f_1, f_2$$

N- N Weak Interaction: Size and Mechanism

NN repulsive core \rightarrow 1 fm range for NN strong force

$$|N\rangle = |qqq\rangle + |qqqq\bar{q}\rangle + \dots = \text{valence} + \text{sea quarks} + \text{gluons} + \dots$$

interacts through NN strong force, mediated by mesons $|m\rangle = |q\bar{q}\rangle + |qq\bar{q}\bar{q}\rangle + \dots$

QCD possesses only vector quark-gluon couplings \rightarrow conserves parity

weak

Both W and Z exchange possess much smaller range [$\sim 1/100$ fm]

Relative strength of weak / strong amplitudes: $\left(\frac{e^2}{m_W^2}\right) / \left(\frac{g^2}{m_\pi^2}\right) \approx 10^{-6}$

Use parity violation to isolate the weak contribution to the NN interaction.

NN strong interaction at low energy largely dictated by QCD chiral symmetry. Can be parametrized by effective field theory methods.
