Mastering One-loop Feynman Integrals with Package-X

Tuesday 10 May 2016 17:00 (15 minutes)

Package-X is a Mathematica package designed to analytically compute dimensionally regularized one-loop Feynman Integrals. In this talk I will showcase many new features in the upcoming update, Package-X 2.0. Among them are (1) the ability to handle *four* propagator factors, (2) test for *power* infrared divergences, (3) construct Taylor series expansions, and many *many* more.

For more information, see <http://packagex.hepforge.org/version2public/version2public.html>.

Summary

Author: PATEL, Hiren (Max Planck Institute)

Presenter: PATEL, Hiren (Max Planck Institute)

Session Classification: Tools & QFT
