

$W+4\gamma$ signature from light charged Higgs boson at the LHC Run-II

Rachid Benbrik

Cadi Ayyad University
Marrakech, Morocco.

Talk given at
High Energy Physics Workshop in Morocco.

Phys.Lett. B774 (2017) 591-598
Eur.Phys.J. C77 (2017) no.9, 621
Work in progress

Oct.27-28. 2017

Outline

HEP Activities in Safi

1. Introduction
2. Two Higgs doublet model: potential and Yukawa couplings
3. Charged Higgs boson decays
4. H^\pm production mechanisms at the LHC
5. $W+4\gamma$ signatures from light H^\pm
6. Conclusions

HEP Activities: Safi team

- ▶ Rachid Benbrik
- ▶ Abdessamad Rouchad
- ▶ Souad Semlali
- ▶ Hicham Harouiz
- ▶ Yahya Mekaoui
- ▶ Abdeljalil Habjia
- ▶ Abdekarim Mahfoud
- ▶ Khadija El Menaour

Expertise

- ▶ Extended Higgs scalars
- ▶ Bluiding Models
- ▶ Higgs Phenomelongies
- ▶ B-Physics
- ▶ High order corrections

HEP Activities: Collaborations and projects

Local groups:

- ▶ Tanger
- ▶ Marrakech
- ▶ Agadir
- ▶ Beni-Mellal

International groups:

- ▶ Europe: Spain, Portugal, France, UK, Sweden
- ▶ Aisa: China, Taiwan, India

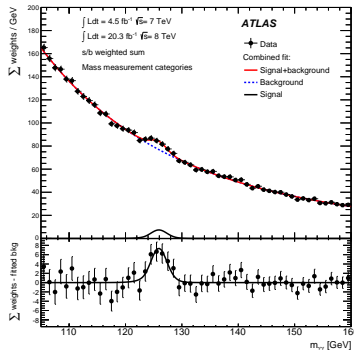

Projects:

- ▶ H2020
- ▶ Moroccan ministry of higher Education and scientific research
- ▶ Fellowship PIFI program

Evidence for a Standard Model like Higgs boson

- ▶ In the summer of 2012 an SM-like particle (h) was found at the LHC.
- ▶ So far its properties agree with SM predictions at the 20% level.
- ▶ Its mass derived from the $\gamma\gamma$ and ZZ channels is

$$m_h = 125.09 \pm 0.24 \text{ GeV}$$

Beyond the SM

- ▶ The SM-like limit exists in various models with extra neutral Higgs.
- ▶ Any extended Higgs sector a Charged Higgs would be a signal.
- ▶ Such scalars appear in multi-Higgs doublet (MHDM).
- ▶ From EWO are in agreement with SM with $\rho = 1$.
- ▶ in this talk I will focus on a very popular model such as 2HDM .

Potential with soft Z_2 -violating

$$\begin{aligned} V(\Phi_1, \Phi_2) = & -\frac{1}{2} \left\{ m_{11}^2 \Phi_1^\dagger \Phi_1 + m_{22}^2 \Phi_2^\dagger \Phi_2 + \left[m_{12}^2 \Phi_1^\dagger \Phi_2 + \text{h.c.} \right] \right\} \\ & + \frac{\lambda_1}{2} (\Phi_1^\dagger \Phi_1)^2 + \frac{\lambda_2}{2} (\Phi_2^\dagger \Phi_2)^2 + \lambda_3 (\Phi_1^\dagger \Phi_1) (\Phi_2^\dagger \Phi_2) \\ & + \lambda_4 (\Phi_1^\dagger \Phi_2) (\Phi_2^\dagger \Phi_1) + \frac{1}{2} \left[\lambda_5 (\Phi_1^\dagger \Phi_2)^2 + \text{h.c.} \right]. \end{aligned} \quad (1)$$

Apart from the term m_{12}^2 , this potential exhibits a Z_2 symmetry,

$$(\Phi_1, \Phi_2) \leftrightarrow (\Phi_1, -\Phi_2) \quad \text{or} \quad (\Phi_1, \Phi_2) \leftrightarrow (-\Phi_1, \Phi_2). \quad (2)$$

The most general potential contains in addition two more quartic terms, with coefficients λ_6 and λ_7 , and violates Z_2 symmetry in a hard way [T.D.Lee PRD8,1226'73](#), "[JF.Gunion et al.The HHG](#)".

- ▶ The parameters λ_1 – λ_4 , m_{11}^2 and m_{22}^2 are real.
- ▶ The potential (1) can lead to CP violation when λ_5 and m_{12}^2 are complex.

Mass eigenstates

We use the following decomposition of the doublets:

$$\Phi_1 = \begin{pmatrix} \varphi_1^+ \\ (v_1 + \eta_1 + i\chi_1)/\sqrt{2} \end{pmatrix}, \quad \Phi_2 = \begin{pmatrix} \varphi_2^+ \\ (v_2 + \eta_2 + i\chi_2)/\sqrt{2} \end{pmatrix}, \quad (3)$$

Here $v_1 = \cos \beta v$, $v_2 = \sin \beta v$, $v = 2 m_W/g$, with $\tan \beta = v_2/v_1$. The charged Higgs bosons are the combination orthogonal to the charged Nambu–Goldstone bosons:

$$H^\pm = -\sin \beta \varphi_1^\pm + \cos \beta \varphi_2^\pm \quad (4)$$

and their mass is given by

$$M_{H^\pm}^2 = \mu^2 - \frac{v^2}{2}(\lambda_4 + \Re \lambda_5), \quad (5)$$

where we define a mass parameter μ by

$$\mu^2 \equiv (v^2/2v_1v_2)\Re m_{12}^2. \quad (6)$$

Mass eigenstates and gauge couplings

With all momenta incoming, we have the $H^\mp W^\pm \phi$ gauge couplings:

$$\begin{aligned} H^\mp W^\pm h &: \quad \frac{\mp ig}{2} \cos(\beta - \alpha)(p_\mu - p_\mu^\mp), \\ H^\mp W^\pm H &: \quad \frac{\pm ig}{2} \sin(\beta - \alpha)(p_\mu - p_\mu^\mp), \\ H^\mp W^\pm A &: \quad \frac{g}{2}(p_\mu - p_\mu^\mp). \end{aligned} \tag{7}$$

The strict SM-like limit corresponds to $\sin(\beta - \alpha) = 1$.

$$\begin{aligned} VVh &: \quad \sin(\beta - \alpha), \\ VVH &: \quad \cos(\beta - \alpha), \\ VVA &: \quad 0. \end{aligned} \tag{8}$$

$$V = W^\pm, Z$$

Theoretical constraints

The 2HDM is subject to various theoretical constraints.

- Stability or positivity of the potential:

$$V(\Phi_1, \Phi_2) > 0 \quad \text{as} \quad |\Phi_1|, |\Phi_2| \rightarrow \infty. \quad (9)$$

This requirement gives the following conditions on λ 's

PM. Ferreira *et al* ,PLB,2005

$$\lambda_1 > 0, \lambda_2 > 0, \lambda_3 + 2\sqrt{\lambda_1\lambda_2} > 0, \lambda_3 + \lambda_4 - |\lambda_5| > 2\sqrt{\lambda_1\lambda_2}. \quad (10)$$

- Perturbativity: satisfy $|\lambda_i| \leq 8\pi$ ($i = 1, \dots, 5$). has significant effect on $(\tan \beta, M_{H^\pm})$ plane.
- Unitarity: all $2 \rightarrow 2$ processes scattering are under control.

$$\text{Max}(\text{Eigenvalues}(\mathbf{M})) < 0.5 \quad (11)$$

Yukawa Interaction for the 2HDM T.D.Lee PRD8,1226'73

$$-\mathcal{L}_{\text{Yukawa}} = \overline{Q}_L \Phi_a F_a^D D_R + \overline{Q}_L \tilde{\Phi}_a F_a^U U_R + \overline{L}_L \Phi_a F_a^L L_R + \text{h.c.}, \quad (12)$$

| Model | d | u | ℓ |
|-------|--------------------|--------------------|--------------------|
| I | Φ_2 | Φ_2 | Φ_2 |
| II | Φ_1 | Φ_2 | Φ_1 |
| III | $\Phi_1 \& \Phi_2$ | $\Phi_1 \& \Phi_2$ | $\Phi_1 \& \Phi_2$ |
| X | Φ_2 | Φ_2 | Φ_1 |
| Y | Φ_1 | Φ_2 | Φ_2 |

Table 1: The most popular models of the Yukawa interactions in the 2HDM.

in Type II (MSSM)

$$H^+ b \bar{t} : \quad \frac{ig}{2\sqrt{2} m_W} V_{tb} [m_b(1 + \gamma_5) \tan \beta + m_t(1 - \gamma_5) \cot \beta],$$

$$H^- t \bar{b} : \quad \frac{ig}{2\sqrt{2} m_W} V_{tb}^* [m_b(1 - \gamma_5) \tan \beta + m_t(1 + \gamma_5) \cot \beta].$$

Charged Higgs boson decays

a charged Higgs boson can decay to a fermion-antifermion pair

$$H^+ \rightarrow c\bar{s}, \quad (14a)$$

$$H^+ \rightarrow c\bar{b}, \quad (14b)$$

$$H^+ \rightarrow \tau^+ \nu_\tau, \quad (14c)$$

$$H^+ \rightarrow t\bar{b}, \quad (14d)$$

to gauge bosons,

$$H^+ \rightarrow W^+ \gamma, \quad (15a)$$

$$H^+ \rightarrow W^+ Z, \quad (15b)$$

or to a neutral Higgs boson and a gauge boson:

$$H^+ \rightarrow hW^+, \quad AW^+ \quad (16)$$

and their charge conjugates.

Light H^\pm ($M_{H^\pm} < m_t$)

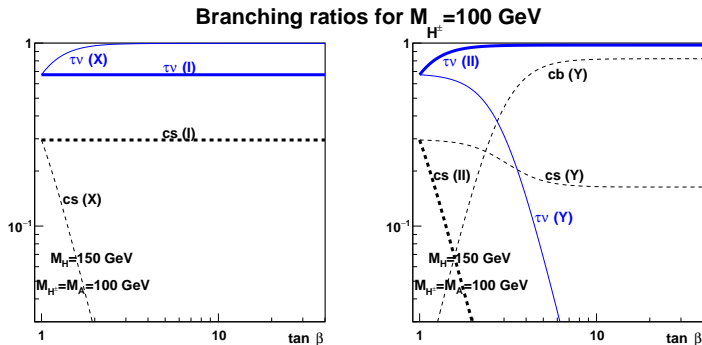

Figure 1: Light charged-Higgs branching ratios vs $\tan \beta$.

- We focus on CPC case and set $M_h = 125$ GeV.

Heavy H^\pm ($M_{H^\pm} > m_t$)

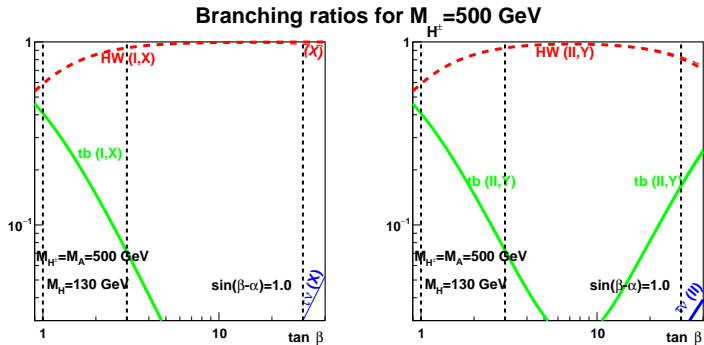

Figure 2: Heavy charged-Higgs branching ratios vs $\tan \beta$.

► $\sin(\beta - \alpha) = 1$.

Heavy H^\pm ($M_{H^\pm} > m_t$)

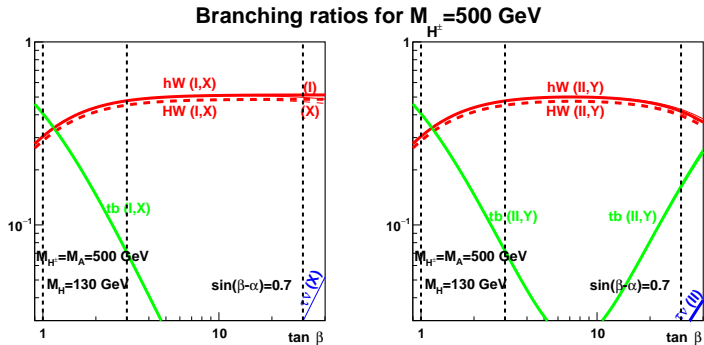

Figure 3: Heavy charged-Higgs branching ratios vs $\tan \beta$.

► $\sin(\beta - \alpha) = 0.7$

Branching ratios vs M_{H^\pm} in Type I

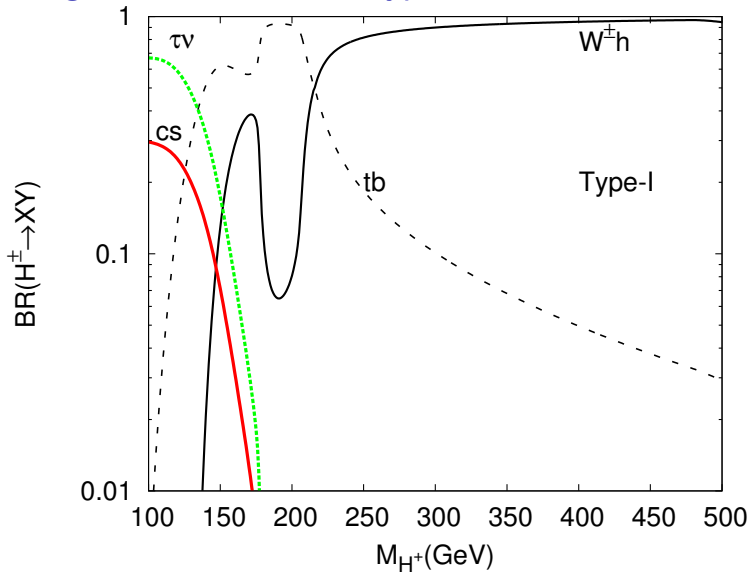

Figure 4: Branching ratios of charged-Higgs as a function of M_{H^\pm} in Type I with $\sin(\beta - \alpha) = 0.81$ and $\tan\beta = 8$.

Branching ratios vs M_{H^\pm} in Type X

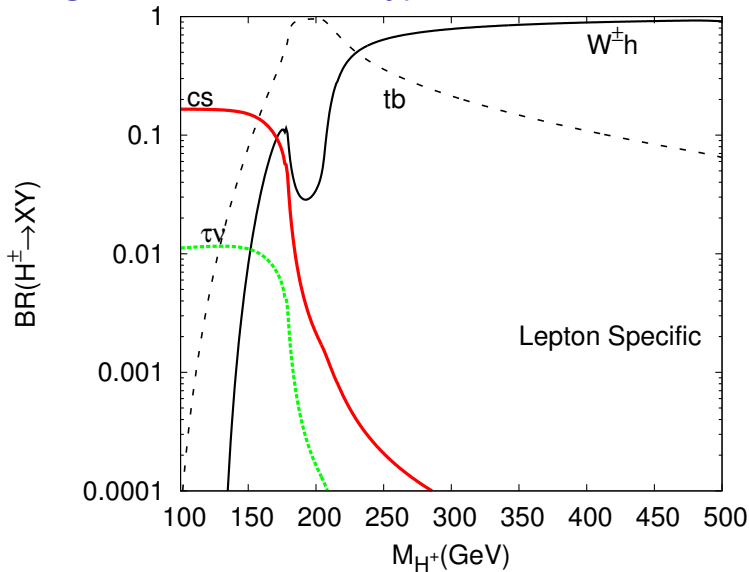

Figure 5: Branching ratios of charged-Higgs as a function of M_{H^\pm} in Type I with $\sin(\beta - \alpha) = 0.81$ and $\tan\beta = 8$.

Production processes: Single production at the LHC

Production processes: Single production at the LHC

Production processes: Pair production at the LHC

Production cross sections $pp \rightarrow H^\pm X$

We use CTEQ6L, $\sqrt{s} = 14$ TeV and $\sin(\beta - \alpha) = 1$ in Types I and II.

- ▶ $g\bar{b} \rightarrow H^+ \bar{t}$, (solid),
- ▶ $gg \rightarrow H^+ b\bar{t}$, (dotted),
- ▶ $gg \rightarrow H_j \rightarrow H^+ W^-$, (dash-dotted).

Cross sections $pp \rightarrow H^\pm X$

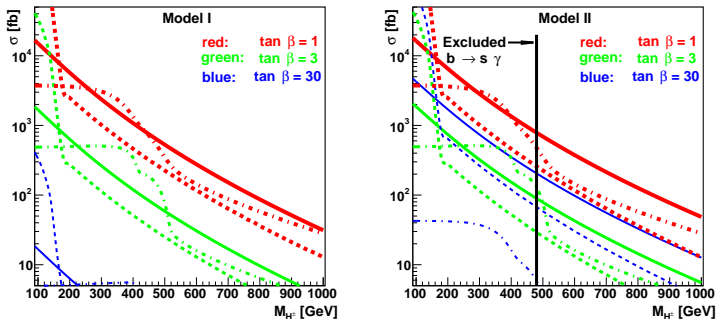

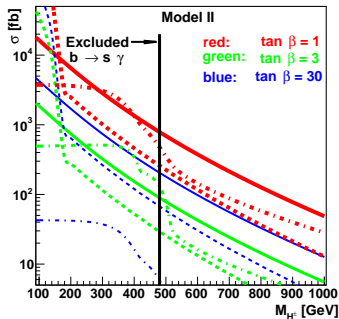

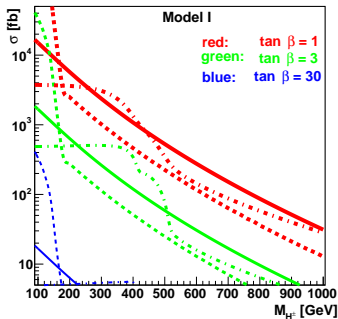

Figure 7: Charged Higgs production cross sections in the 2HDM, at 14 TeV

Production cross sections $pp \rightarrow H^\pm X$

We use CTEQ6L, $\sqrt{s} = 14$ TeV and $\sin(\beta - \alpha) = 1$ in Types I and II.

- ▶ For $\tan \beta = 1$, type-I and type-II are different due to sign Yukawa.
- ▶ Models X and Y will have the same predictions except for $(\tau\nu)$.
- ▶ The bumpy structure is due to resonance of neutral Higgs.

Cross sections $pp \rightarrow H^\pm X$

Allowed regions in type-1

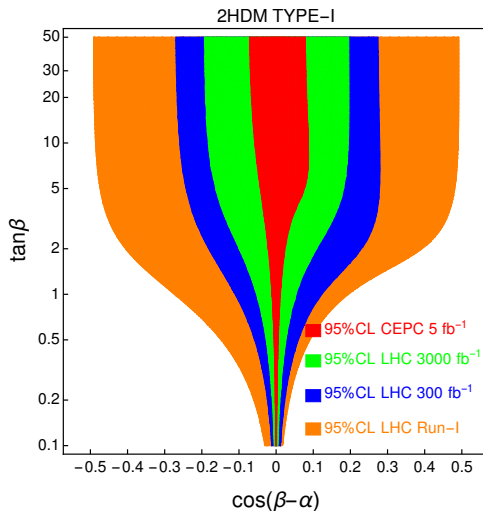

Figure 8: Allowed regions of the $[\cos(\beta - \alpha), \tan \beta]$ plane for the 2HDM Model I.

$W+4\gamma$ signatures from light H^\pm at Run-II

Here we focus on on the following scenario:

- ▶ H is the SM-like
- ▶ h is fermiophobic state
- ▶ $pp \rightarrow H^\pm h$ followed by $H^\pm \rightarrow W^\pm h$

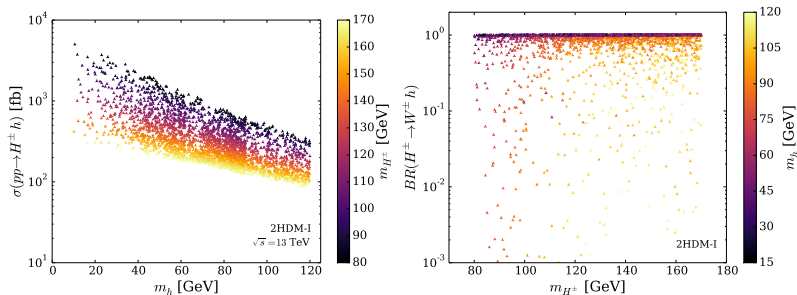

Figure 9: The maximum of cross-sections $pp \rightarrow H^\pm h$ and $H^\pm \rightarrow W^\pm h$

$W+4\gamma$ signatures from light H^\pm at Run-II

Here we focus on the following scenario:

- ▶ H is the SM-like
- ▶ h is fermiophobic state
- ▶ $pp \rightarrow H^\pm h$ followed by $H^\pm \rightarrow W^\pm h$

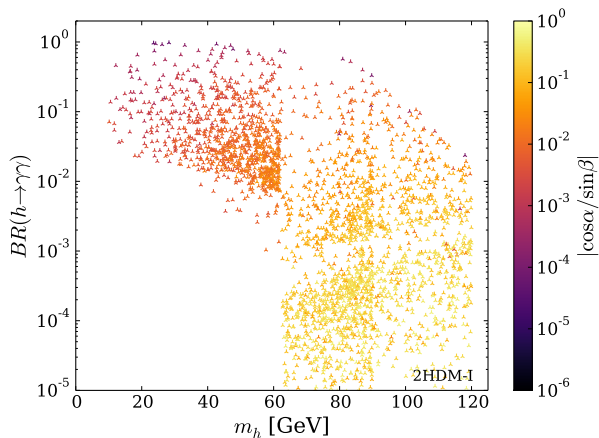

Figure 10: The maximum of Branching ratio of $h \rightarrow \gamma\gamma$

$W+4\gamma$ signatures from light H^\pm at Run-II

Here we focus on on the following scenario:

- ▶ H is the SM-like
- ▶ h is fermiophobic state
- ▶ $pp \rightarrow H^\pm h$ followed by $H^\pm \rightarrow W^\pm h$

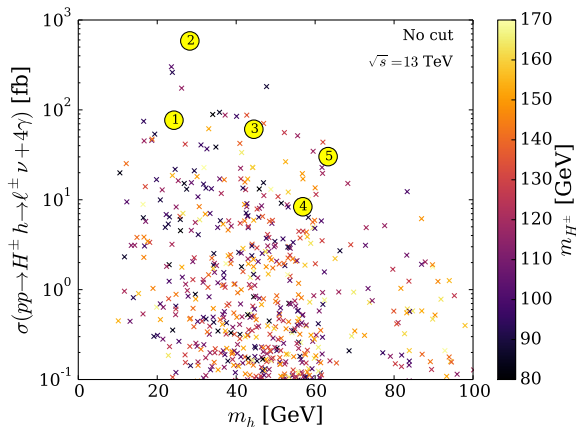

Figure 11: The maximum of XS in fb.

$W+4\gamma$ signatures from light H^\pm at Run-II

Here we focus on on the following scenario:

- ▶ H is the SM-like
- ▶ h is fermiophobic state
- ▶ $pp \rightarrow H^\pm h$ followed by $H^\pm \rightarrow W^\pm h$

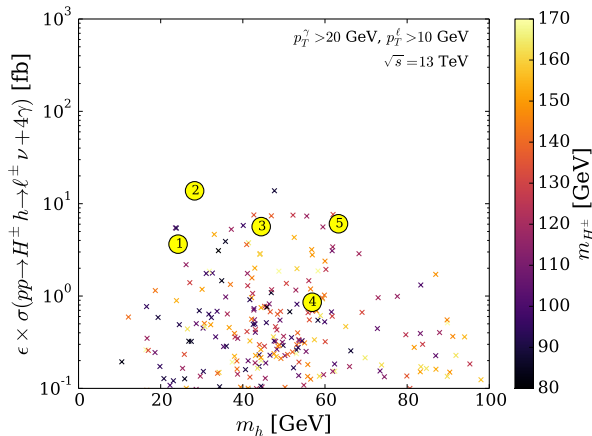

Figure 12: The maximum of XS in fb.

$W+4\gamma$ signatures from light H^\pm at Run-II

Here we focus on on the following scenario:

- ▶ H is the SM-like
- ▶ h is fermiophobic state
- ▶ $pp \rightarrow H^\pm h$ followed by $H^\pm \rightarrow W^\pm h$

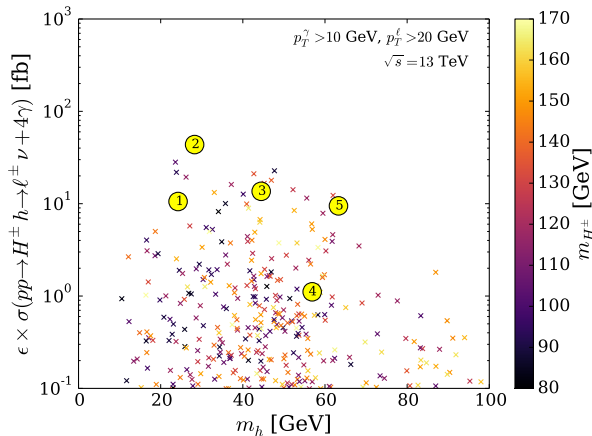

Figure 13: The maximum of XS in fb.

Conclusions

- ▶ Various SM like models exist with extra Higgs scalars.
- ▶ A charged Higgs would be the most striking signal of a Higgs with extra doublets.
- ▶ In this talk we have analyzed type 1 2HDM by focusing on the most "natural" decay modes are $\tau\nu$ or $W\phi$ with any neutral Higgs.
- ▶ With a reasonable cuts on the p_T^ℓ and p_T^γ , $\sigma(W + 4\gamma)$ still large.
- ▶ We therefore look forward to the ATLAS and CMS experiments testing this scenario.

Thank you!
