		./4																	

Remarks on SALT

To assess:

- Building blocks to be added in the final iteration (only rad-hard memory?)
- Performance parameters (e.g. power consumption, SEU immunity...) IRRADIATION plans
- Mass production testing plans (key element to determine production timeline)

Note: this remains one of the key schedule drivers

A few key issues

□Production of the staves is starting:

- Check of the risks associated to R&D still in progress (full SALT design, validation of HV/LV distribution, flex& pigtails, hybrids, "slice test")
- □Definition of assembly procedure, test, and shipment method ⇒ better evaluation of the construction and commissioning times
- Testing program needs to be defined as it is the important time driver (many components to test thoroughly

LHCC milestone

WP1b Hybrids

Remarks:

 Prototyping necessary to establish that we have a working system
 Need to be ready well in advance of population of instrumented staves to validate system design

- □SALT128 urgently needed for system design validation
- **Concerns**:
 - Complexity (tradeoff between complexity of digital and power consumption)
 - New technology: radiation effects
 Performance with chosen powering scheme
