

# $\tau$ Reconstruction validation

**Jyothsna Rani KOMARAGIRI (SFU)**

Aldo Saavedra (University of Sydney)  
& Till Natterman (University of Bonn)  
(The  $\tau$  validation group)

16<sup>th</sup> April 2009  
Tau Workshop @ Copenhagen

# Overview: validation of $\tau$ reconstruction

## Offline Validation

- Express stream validation/monitoring at Tier0 (tau monitoring).
- Validation/commissioning after Cosmic/collider data taking.

# Overview: validation of $\tau$ reconstruction

## Offline Validation

- Express stream validation/monitoring at Tier0 (tau monitoring).
- Validation/commissioning after Cosmic/collider data taking.

## Offline Validation: **TauTools/TauValidation** packages

- Nightly tests inside **Run Time Tester** framework (**Till**).
- Weekly/Bi-weekly Physics Validation (**Aldo**)  
⇒ backbone for central MC production.
  - Tests *EvGen* → *Simulation* → *Digitization* → *Reconstruction* chain.
- Tau Event Data Model (EDM) validation  
(merging tauRec & tau1p3p and CommonDetails).
- Validation of centrally produced MC samples.

TauValidation takes POOL formats, i.e. *ESD/AOD/D<sup>1</sup>PD* as inputs and runs in Athena or AthenaROOTAccess(ARA).

# RTT tests: Daily Feedback

## RTT setup

## MC data Sample

- $Z \rightarrow \tau\tau$ , csc11 (14TeV)
- $W \rightarrow \tau\nu$ , csc11 (14TeV)
- mc08  $Z \rightarrow \tau\tau$ , displaced vertex (10TeV)
- mc08  $W \rightarrow \tau\nu$ , displaced vertex (10TeV)

# RTT tests: Daily Feedback

## RTT setup

## MC data Sample

- $Z \rightarrow \tau\tau$ , csc11 (14TeV)
- $W \rightarrow \tau\nu$ , csc11 (14TeV)
- mc08  $Z \rightarrow \tau\tau$ , displaced vertex (10TeV)
- mc08  $W \rightarrow \tau\nu$ , displaced vertex (10TeV)

## Updates:

- **RTT TWiki page** updated. Documenting the “tauRec” and “tauEvent” tags used for making “Reference” TauVal.root files.
- Latest reference: dev rel\_0, Sunday 5<sup>th</sup> April 2009
- No problems noticed since then.

# Physics Validation: Weekly Feedback

When **“Displaced vertex”** was first used in sampleA production

Also features the region where the Efficiency and ID are restored to original values

The transverse momentum distribution shows the same trend

# Physics Validation: Weekly Feedback

After using external track selector tool in “tauRec” to take “Displaced vertex” into account.

“Displaced vertex” is used in MC08 samples.

# Physics Validation: Updates

## News

- MC09 sample production will start *around 20<sup>th</sup> May* (for full schedule look at the backup slide).
- Validation of release 15 started.

## Updates

- Reconstruction and digitization version 15.0.0.2 - still under investigation.
- More details on validation of pileup sample scenarios can be found in the additional slides from Aldo attached on the agenda server.

# TauValidation: New roles

## New role 1:

- TauValidation does the performance validation nightly & weekly/bi-weekly.
- New role is to extend this package even for producing the plots & tables for the regular updates of “tauRec performance notes”.

## Motivation:

- Centralized way of providing “True Hadronic taus and prongs”. Also the truth matching and efficiency/rejection definitions.
- Provide test bed to compare the performance of various tau ID discriminants.
- CBNTs in Release15 with newEDM (uses dumper from TauTools) are completely different from Release14 CBNTs (and do need validation!).

# TauValidation: New roles

## New role 2: Primary DPD validation:

- DPD is a Skimmed, Slimmed and Thinned version of ESD/AODs
- Made from Region of Interest ESDs, ie, store tracks around the tau candidates for doing tau re-reconstruction.
- Antonio Limosani will be talking more on this.

## Performance of the tau reconstruction and identification algorithm with release 14.2.20 and mc08 data

<sup>7</sup> *Simon Fraser University, Burnaby, BC, Canada*

<sup>8</sup> *Physikalisches Institut, Universität Bonn, Bonn, Germany*

- No. of ways to define true hadronic tau, no. of prongs in its decay, no. of reco tracks, truth matching is **directly proportional** to the no. of authors!
- tauRec developers use CBNTs and tauID developers use CBNTs/AODs!

# Details on the cross checks

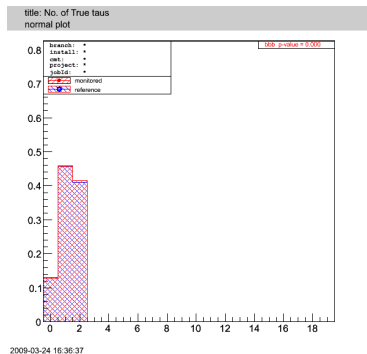

## Validating tau validation software:

- For cross checking with CBNT code: CBNTs were produced from AODs (signal/background) and CBNT code is run on them. TauValidation is run on the same AODs which went in making the CBNTs.
- Same AOD datasets are used for cross checking with Artur's TauTrackTools + ARA code for "Rejection vs Efficiency".
- Same selection cuts are applied.

# List of basic variables to check first

## True Hadronic Tau counting

Exclude Geant4 particles including taus.

REFERENCE: TauTools **MONITORED: CBNT code**

# List of basic variables to check first

## Track Multiplicity of Reco Tau candidates

Use `tauJet`  $\rightarrow$  `numTrack()` for all the three types of reco tau candidates

Left: `nLooseTrk()` Right: `numTrack()` for all calo candidates.

`tauJet`  $\rightarrow$  `numTrack()` provided default tracks for both & track ONLY seeded and loose tracks for calo ONLY seeded reco taus.

## Performance cross checks on Signal samples

Before any bug fixes:

# tauRec note Plots with r604 samples

- In r541 samples one forward HEC sector is OFF.

- In r604 samples the above HEC sector is put back in.

tauRec note plots using r604 samples....almost final.

# Summary and Plans

## Summary

- Analysis framework independent tools for doing Tau performance studies are written from scratch and are available in CVS.
- These tools are being used nightly/weekly/bi-weekly and also to validate new EDM.
- Also for the ATLAS note providing regular performance updates of tauRec algorithm and Primary DPD validation.
- While making the plots for tauRec note extensive cross checks of TauTools/Validation packages are done.
- Finished making the plots for tauRec note with r604 samples.

# Summary and Plans

## Plans

- Put the plots and tables for r604 samples in the “tauRec note” once the conveners are happy.
- Document running TauValidation to make tauRec note performance plots on TWiki.
- Add needed methods for validating skimming/slimming and thinning for Primary DPD validation.
- Help out tauWG in the transition to move to new/improved definitions for truth tau, nProngs, truth matching, efficiency and rejection.

# MC09 validation plans and sample production

Date	Release	Release comments	sample A production	Validation meeting topics	Production
April					
15th	15.0.0.3 released	simulation fixes	full sample A sim - sample A reco (g491 and g492)		
15th	15.1.0 released	final mc09 geometry			
21th				g492 validation (after fixes) against g491 (ATLAS-GEO-06-00-00)	
22th	15.1.0.1 released				
23-27 th			full sample A sim (final geometry - non displaced vertex) - reco of ATLAS-GEO-06-00-00 and of the new geometry		
28- may 3rd			full sample A sim with displaced vertex - sim of ATLAS-GEO-02-01-00 - reco of both		
30th				Comparison of the new geometry against ATLAS-GEO-06-00-00	
May					
5th				Comparison of the new geometry (displaced) against g492/ ATLAS-GEO-02-01-00. Comparison of g492/ATLAS-GEO--02-01-00 against g491/ ATLAS-02-01-00	
+ 2 weeks contingency (late software releases, production issues , bugs found) --> May 20th					MC09 can start

## HEC sector

# DQMF

## Data Quality Monitoring Framework

### Overview

The [DQHistogramAnalyzer](#) is a utility to check histograms in an automated way and report results and summaries; it is also referred to as "offline DQMF", as the primary 'han.exe' application uses the [DataQualityMonitoringFramework](#) (DQMF). The primary utilities are

- han.exe
- han-config-gen.exe
- han-config-print.exe
- han-results-print.exe
- handi.py

For displaying results one can use DCube as well.

### Displaying results

As above, running the han display utilities without any arguments prints usage information. The command-line utility 'han-results-print.exe' provides a convenient and quick way to dump the results from the output han file to the screen. For a complete display, use the 'handi.py' ("han display") script to produce web pages with the results. An example of this display is shown [here](#).

Alternatively, the [DCube](#) display, written by Krzysztof Daniel Ciba, provides a way of viewing the han results, as shown [here](#). There is a documentation link at the bottom of the DCube pages describing how to configure and run this application.
